But there are two forms of utility friendship, one legal and the other ethical. And political friendship looks to equality and to the thing at hand, as buyers and sellers do. That is why it is said "To a friendly man his wage."[100] When it is in accord with an agreement, then, this political friendship is also legal. But when the partners trust each other, it tends to be ethical and companionate. That is why there are complaints most of all in this form of friendship. And the cause is that it is contrary to nature; for friendship in accord with utility and friendship in accord with virtue are distinct. But the parties wish to have both at the same time, that is, they associate for the sake of utility, but they make it ethical, as decent people do. That is why, as trusting each other, they do not make it legal.

For in general, of the three forms, most complaints arise in utility friendship; for virtue leaves no grounds for complaint; pleasure friends get it, give it, and depart; but utility friends, if their dealings are not legal but companionate, do not dissolve their relationship right away. Nonetheless, legal utility friendship also leaves no grounds for complaint. And the legal resolution is to look to money (for it is by it that the equal is measured), while the ethical is voluntary. That is why there is a law in some places that those whose association consists in being friendly in this way are not to bring lawsuits over voluntary transactions—and rightly so; for it is not naturally just for good people to do so, and these people engage in transactions as good and trustworthy people. And in this form of friendship the complaints are dubious on both sides, as to how either will complain, when they trusted ethically, not legally.

Also, there is certainly a puzzle about what way one should judge what is just, whether in relation to the thing at hand, looking to how large the service rendered was, or of what sort the beneficiary. For it is possible for it to be precisely the way

99. 1236ª37.

100. Hesiod, *Works and Days* 370.

Theognis said, "A small thing for you, goddess, but for me a great one."[101] But it is also possible for the opposite to come about, as in the saying, "It's an amusement for you but death for me."[102] Hence the complaints. For the benefactor claims recompense as having done a great service, because he did it for someone in need, or something else of that sort, stating how much of a benefit it was able to produce for the other party, but saying nothing about what it meant for himself, while the beneficiary does the contrary, stating how much it was for the other party, but not how much it meant to himself.

Sometimes too when they are the recipients there is doubt. For the beneficiary states how little benefit resulted for him, while the benefactor states how great a thing it was for him to do it—for example, if the latter took great risks to confer a drachma's worth of benefit, he speaks of the amount of danger, the other of the amount of money, just as in the repayment of a financial loan. For there too the disputes are about these things; for, unless they have made the matter explicit, one wants its value to be what it was then, the other what it is now.

Political friendship, then, looks to the agreement and the thing, while ethical friendship looks to the deliberate choice. So the latter is more of a just thing, and a justice fitted to friendship. The cause of the fighting is that ethical friendship is more noble, utility friendship more necessary. People start as if they are ethical friends, and being friends because of virtue, but when opposed over some aspect of their individual interests, it becomes clear that they were something else. For ordinary people pursue the noble when they have an abundance of property, which is also why they pursue the nobler form of friendship.

So it is evident how to make determinations about these cases. For if they are **1243^{b}1** ethical friends, one must look to their deliberate choice to see whether it was fair, and then nothing else must be claimed by either party against the other. But if they are useful and political friends, one must look to see how their agreement would have been profitable. If one party says it's one way, and the other that it's the other, it is not a noble thing, when repayment must be made, to speak noble words (and it is the same way in the other case). But since they did not make this explicit, as is ethically done, someone must render a judgment, and neither of them should be deceptive in answering. So each must be content with his luck.

But that ethical friendship is in accord with deliberate choice is clear, since even if after having received great benefits one does not repay them because of inability, but does so to the extent one can, one acts nobly. Even the god is content with receiving sacrifices that are in accord with our capacity. But it will not be enough for a seller, if one says that one is not able to pay more, nor for a lender.

Many complaints arise in friendships for those not on a straight course, and seeing what is just is not easy. For it is difficult to measure what is not on a straight course

101. Theognis, ln. 14 Diehl.
102. Source unknown.

by one thing, as happens in the case of sexual relationships; for the one party pursues the other as pleasant to live with, while the other at times pursues the one as useful. But when the pursuer's love ceases, because the other has changed, he changes, and then they both rationally calculate the quid pro quo, and disagree: as Pytho and Pammenes[103] did; as, in general, teacher and student do (for scientific knowledge and money are not measured by one thing); as Prodicus[104] the doctor did with the person who paid him [too] small a fee; and as the lyre player and the king did. For the king associated with the lyre player as pleasant, the lyre player with the king as useful. Then, when the king had to pay, he made out that he was himself involved as being pleasant, and said that just as the lyre player had pleased with his singing, so had he by making promises.

Nonetheless, here too it is evident how one may recognize [what is just]; for here too one must measure by one thing—not by a single term, however, but by a ratio (for one must measure by what is proportional), just as political community too is measured. For how will a shoemaker have communal relations with a farmer if their works are not equalized by proportionality? And for those whose relationship is not on a straight course, the proportional is the measure—for example, if one party complains that he has given wisdom, and the other money, what is the ratio of the wisdom to the wealth? And then what is what has been given to each? For if one has given half of the lesser thing, while the other has given not even a small fraction of the greater one, it is clear that the latter is being unjust. But here too it may be in a starting-point that dispute lies, if one says that they came together as useful to each other, while the other denies it, saying that it was in accord with some other sort of friendship.

7.11
Problems about Friendship

1244a1 As regards the good person, and the friend in accord with virtue, we must investigate whether it is to him that one should provide useful services and help or to someone who is capable of making a return. This is the same problem as whether one must benefit the friend or the excellent person more. For if someone is a friend and also excellent, it is presumably not a very difficult one, provided that one does not amplify the one factor and diminish the other, doing a lot for him as a friend, but little for him as decent. But if not, many problems arise—for example, if one person was a friend but will not be in the future, while another will be one but is not yet; or if one person became a friend but is not one now, while another is a friend now but was not one nor will be one in the future.

103. The identities are uncertain. Pammenes may be the famous Theban general of that name, in which case Pytho is unknown. Or Pytho may be the Byzantine rhetorician and ambassador of Philip of Macedon, and Pammenes an otherwise unknown student of his.
104. Perhaps the Hippocratic doctor from Selymbria.

But the first problem is more difficult. For perhaps Euripides was on to something when he wrote:

> Words are just wages if words you bring,
> But a deed for him who a deed supplies.[105]

Also, not all things are owed to the father, but there are others that are owed to the mother; and yet the father is better; for not all sacrifices are owed to Zeus, nor does he receive all the honors, but [only] some. Perhaps, then, some things are owed to the useful person, others to the good one. For example, if someone provides food and necessities, he is not also owed being lived with; therefore, one who is owed being lived with is also not owed the things that the utility friend provides but he does not. But those who do this, giving everything to their beloved when not owed, are worthless.

Also, all the defining marks of friendship in our accounts are certainly in a way marks of friendship, but not of the same form of it. For it is a defining mark of a utility friend and a benefactor and, indeed, of a friend of any sort to wish to do what is good for the other person (for this definition of friendship does not distinguish the sort); but to wish that another exist, to wish to live together with him, and to wish to be pained and pleased together with a friend in accord with pleasure [are distinct marks]. But all these defining marks are said of things in accord with certain sorts of friendship, but none in accord with just one sort. That is why there are several, and why each—for example, the deliberate choice of existence—seems to be, but none really is, that of a single sort of friendship. For the superior party and benefactor also wishes his own work to exist; and to the one who gives existence a return is also owed, but it is not with this person that one wishes to live together, but with the pleasant person.

Some friends do injustice to each other; for they love the things at issue more than the one who possesses them. That is why [each] is friends even with their things—for example, he has chosen wine because it is sweet, and wealth because it is useful; for it is more useful [than its possessor]. That is why, then, the friend gets annoyed, as if he had chosen more in return for less. And [such friends] complain; for they are now seeking someone who is a good person, having previously sought the pleasant one or the useful one.

7.12
Friendship and Self-Sufficiency

We must also investigate self-sufficiency and friendship, and how their capacities stand in relation to each other. For someone might raise a puzzle as to whether, if someone were self-sufficient in all respects, he will have [any need for][106] a friend, if **1244b1**

105. Fr. 890 Nauck.
106. Supplied to fill a lacuna in the manuscripts.

a friend is sought in accord with a need. Or is this not so? If the good person will be most self-sufficient, and the person with virtue is happy, why would he need a friend? For it is characteristic of a self-sufficient person to need neither useful people, nor amusing ones, nor living together [with others]; for to be with himself is sufficient for him.

This is especially evident in the case of a god; for it is clear that needing nothing added, he will not need a friend either, nor will there be [one] for him, for whom nothing is ever needed. So too a human being who is the happiest will least of all need a friend, except to the extent that it is impossible for him to be self-sufficient. It is therefore necessary for the one who is living the best life to have the fewest friends, and they must always be becoming fewer. And he must not treat as a serious matter that there should be friends, but rather be contemptuous not only of the useful ones, but even of those that are choiceworthy with a view to living together.

But then surely too in that case it would seem evident that the friend would not be for the sake of utility or benefit. But neither is he a friend because of virtue alone; for whenever we are in need of nothing, it is then that we all seek others to join us in our pleasures, and beneficiaries rather than benefactors. But we have better judgment when we are self-sufficient, which is when we also especially need friends worthy of living with, than when we are in need.

But we must investigate this puzzle, in case, while something is correctly said, something else escapes our notice because of the comparison [to a god]. But this is clear once we have grasped what living in accord with activity and as an end is. It is evident, then, that living in accord with activity is perceiving and knowing, so it also follows that living together is perceiving together and knowing together. But it is perceiving itself and knowing itself that is most choiceworthy for each thing, and because of this the desire for living is innate in all; for one should posit living as a sort of knowing. If, then, someone were to make a cut and produce knowing by itself and not [knowing] itself,[107] there would be no difference between somebody else knowing instead of oneself. But that would be like someone else living instead of oneself.

It is reasonable, indeed, that to perceive and to know oneself is more choiceworthy. For one must at the same time put together two things in the argument, both that the living is choiceworthy and that the good is, and, on the basis of these things, that the same sort of nature belongs to these. If, then, of a column-pair of this sort[108] one or other of the columns is always in the rank of the choiceworthy, both the knowable and the perceptible are generally speaking [in it] by having a share of the determinate nature. So to wish to perceive oneself is to wish oneself to be of such a nature. Since, then, we are not intrinsically each of these things, but rather by partaking of the capacities [active] in perceiving and knowing (for, when perceiving,

107. Accepting the seclusion of ἀλλὰ τοῦτο . . . λανθάνειν ("but this escapes notice, as it was written in the argument, though in the thing at issue it is something that does not escape notice").

108. *Met.* 1066a14–16.

one becomes perceptible in this way and in accord with this,[109] just as what one is antecedently perceiving does, and in accord with the way in which and what one is perceiving, and when knowing, one becomes knowable [likewise]). So because of this too one wishes always to live because one wishes oneself always to know, and this because one wishes oneself to be knowable.

Choosing to live together might seem to those investigating the matter to be in a way foolish, first, in the case of things we share in common also with the other animals—for example, eating and drinking together; for what difference does it make if these things occur among those nearby or those apart, if one sets aside speech? But surely even sharing in random conversation is another thing of this sort. At the same time, neither teaching nor learning is possible for friends who are self-sufficient; for if one is learning, one is not in the state one should be, and if the other is teaching, the friend is not. But the likeness [between them] is friendship.

But surely it appears at least that [one should choose to live with others], and that we all share in good things more pleasantly with friends, to the extent that these fall to each, and are the best of which he is capable. But of these, bodily pleasures fall to one, contemplation of music to another, and philosophy to another. And it should be at the same time as the friend (which is why one says "distant friends a burden are"), so that they should not be apart from each other when this is taking place. Hence sexual love too seems similar to friendship; for the lover desires to live together [with his beloved], though not in the way he most of all should, but in accord with perception.

Therefore, on the one hand, the argument says these things, in going through the puzzles, while, on the other hand, the fact is manifestly this [latter] way. So it is clear that going through the puzzles has led us astray in some way. Hence we must look to see what is true. For the friend wishes to be, as the proverb says, another Heracles, another oneself.[110] But he is split apart, and it is difficult for all to come about in one. But, while with respect to his nature a friend is what is most akin, one is like [him] with respect to body, another with respect to soul, and one with respect to one part of these, another with respect to another. But nonetheless the friend wishes to be, as it were, a separate oneself. To perceive one's friend, then, is necessarily to perceive oneself in some way, and to know oneself in some way. So it is reasonable for both mutual enjoyment of unrefined things and living together with the friend to be pleasant (for there is always a simultaneous perception of him), but more so in the case of the more divine pleasures. The cause of this is that it is always more pleasant to contemplate oneself [participating] in the better good. But sometimes this is a **1245^{b}1** feeling, sometimes an action, sometimes something else. But if [it is more pleasant to contemplate] oneself living well, and also in the same way one's friend, being active in living together, their community consists most of all of the ones included in their end. That is why it consists in contemplating together and feasting together, not for

109. *DA* 430^{a}2–5, *Met.* 1072^{b}20–23.
110. *NE* 1166^{a}31–32.

the sake of nourishment and the necessities (for associations of this sort seem not to be) but rather indulgences [only]. But it is in [pursuing] the end he is capable of achieving that each one wishes to live together with another. And if this is not possible, people most of all wish to benefit friends and be benefited by them.

Therefore, that we should live together with others, that all wish for this most of all, and that the happiest and best person is most of all of this sort is evident; and that this did not appear to be so according to the argument, though it was saying something true, happened reasonably too. For although the comparison [with a god] is true, the resolution is in accord with the putting together. For because the god is such as not to need a friend, its claim is that the one who is like him is such too. And yet according to this argument the excellent person will not even understand; for it is not in this way that the god is in a good state [of activity]; instead, he is better than to understand something else beyond himself. And the cause of this is that for us the good is in accord with something else, while for that being he himself is the good for himself.

As for our seeking and praying to have many friends, while at the same time saying that he who has many friends has none, it is correct to say both. For if it is possible to be living together and perceiving together with many at the same time, doing so with as many as possible is most choiceworthy. But since it is very difficult to do so, it is necessary for the activity of perceiving together to be among fewer, so that it is not only difficult to acquire many friends (for one must put them to the test) but also to make use of them when one has got them.

Sometimes too we wish the loved one to be absent, if he is doing well, while at other times we wish to share the same things, and wishing to be together is fitted to friendship; for when it is possible to both be together and do well everyone chooses it. But when it is not possible to be together, we choose, perhaps, just as his mother might have chosen for Heracles, to be a god rather than to be with her and to labor for Eurystheus.[111] For they all might also make a quip like the one made by the Spartan in a storm, when someone told him to call on the Dioscuri[112] for help.

It seems to be characteristic of the lover to keep others from sharing in his hardships, and characteristic of the beloved to wish to share in them. And it happens that both are reasonable. For nothing should be as painful to a friend as his friend is pleasant. On the other hand, it seems that he should choose what is not in his own interest. That is why people prevent sharing (for it is enough that they themselves are suffering), in order not to appear to be looking out for themselves, to be choosing enjoyment even at the cost of the suffering of their friend, and further, to be preferring the easiness of not bearing the evils alone.

111. The one who imposed the famous labors on Heracles.

112. Castor and Pollux, who were often invoked by sailors in a storm, were important members of the Spartan pantheon. What the Spartan said was probably something like "Now that I'm in trouble, you want me to involve my friends in it too."

But since both doing well and being together are choiceworthy, it is clear that being together plus a lesser good is more choiceworthy in a way than being apart plus a greater one. But since it is unclear how much being together is worth, people disagree about this from the outset and think that sharing everything together is fitted to friendship, just as they also say that eating together is more pleasant, even when having the same things. On the other hand, however, others do not wish this, since, if indeed one will take extreme cases, they would be agreeing that doing very badly together [is more pleasant] than doing very well apart.

The situation is also much the same as this as regards strokes of bad luck. For sometimes we do not wish our friends to be present or to be suffering, when they are not going to make anything better. But at other times for them to be present is a very pleasant thing. And this contrariety is also a reasonable one. For it comes about because of the things just said, that is, because, on the one hand, we simply try to shrink from contemplating a friend suffering or being in a bad state (just as in our own case), while, on the other hand, seeing a friend is pleasant (just like any other very pleasant thing), due to the cause that was mentioned, and to see him not ill, if one is ill oneself. So whichever of these is most pleasant tips the balance of wishing him to be present or not.

And this is also what happens in the case of inferior people, and comes about due to the same cause; for they are most anxious that their friends not do well nor even exist, if it is necessary for they themselves to do badly. That is why they sometimes kill their beloveds together with themselves. For they perceive their own bad state more, just as one who has also remembered that he was once doing well would perceive his bad state more than if he thought he had always been doing badly.

BOOK 8

8.1
Are Virtues Sciences?

One might raise a puzzle as to whether it is possible to use each thing both for its natural end and otherwise, and this either insofar as it is itself or, on the other hand, coincidentally—for example, if it is an eye, to see or also otherwise, to mis-see, by distorting it so that one thing appears to be two. Both of these uses, then, are because it is an eye, being used as an eye, but another use is coincidental—for example, if it were possible to sell it or eat it. It is the same way with using scientific knowledge; for one can use it truly and to err—for example, when one voluntarily writes incorrectly, one uses it as if it were just now ignorance, as it were, altering one's hand; in fact, dancing girls sometimes use their foot as a hand and it as a foot.

If, then, all virtues are sciences, it would also be possible to use justice as injustice. Therefore, a person doing unjust things will act unjustly from justice, just as he will do ignorant ones from scientific knowledge. But if this is impossible, it is evident
1246b1 that the virtues could not be sciences. Nor, if it is not possible to be ignorant from scientific knowledge, but only to err, and do the same things as if from ignorance, will
5 someone act from justice as from injustice.

But if, further, practical wisdom is a science and something true, it too will behave in the same way as it; for it would be possible to act foolishly from practical wisdom, and to make precisely the same errors as the fool does. But if the use of each thing, insofar as it is the thing, is simple, then, in acting in that way, they would also be acting in a practically wise way. But in the case of the various sciences there is another
10 controlling one that produces the distortion. But what controls the one that controls all of them? For it cannot any longer be scientific knowledge, at any rate, or understanding.[113] But then it cannot be virtue [of character] either; for it is the virtue of the ruling element that uses the virtue of the one that is ruled [not the other way around].

What science, then, is it? Or, just as lack of self-control is said to be a vice of the non-rational part of the soul, is the one lacking self-control, while still possessing
15 understanding, somehow intemperate? But if, then, when his appetite is strong, it will produce distortion, and the practical wisdom of the person who lacks self-control will rationally calculate contraries, it is clear that if there is virtue in [the appetitive part] but ignorance in the rational part, they are altered in the other way. So it will be possible to use justice in a non-just way, and practical wisdom in a bad and foolish way, so that it even [calculates] contraries; for it would be strange that whenever
20 wickedness comes to be present in the non-rational part, it will distort the virtue of the calculative part and make it ignorant, while virtue in the non-rational part, ignorance being present, will not distort it and will make it judge in a practically wise way and as it should. (And, conversely, practical wisdom in the rationally calculative
25 part [will make] intemperance in the non-rational part act temperately—which is precisely what self-control seems to do.) So there will also be [acting] in a practically wise way from ignorance.

These results are strange, especially that of behaving in a practically wise way from ignorance; for we do not see this in any of the other cases, as, for example, [a case
30 where] intemperance distorts medical and grammatical knowledge,[114] but not ignorance, if it is the contrary, because there is no excess present in it, but rather virtue, in general, is related to vice in this way. For in fact the just person is capable of all that the unjust one is, and in general incapacity is included in capacity.

So it is clear that, at the same time, people are practically wise and the states
35 of their non-rational part are good, and the Socratic view, that nothing is stronger than practical wisdom, is correct. But his saying that it is scientific knowledge is not

113. Reading ἢ νοῦς.
114. *NE* 1140b12–16, *Pol.* 1287a32–b3.

correct; for practical wisdom is a virtue, not scientific knowledge, but another kind of knowledge.

8.2
Luck and Happiness

Since not only do practical wisdom and virtue produce doing well in action, but we say too that lucky people do well, as if good luck also produces doing well, and the **1247^{a}1**
other things that scientific knowledge does, we must therefore investigate whether it is by nature that one person is lucky, another unlucky, or not, and how things stand on these matters. For that some people are lucky is something we see; for, though foolish, they accomplish many things correctly where luck is in control, and further, even in cases where a craft exists, but where in fact there is much luck involved—for 5
example, in generalship and in navigation. Are people like this, then, due to some state? Or are some people doers of lucky actions not due to being of a certain sort? For as things stand, people think that some are lucky by nature, and that nature makes people be of a certain sort, and that they are different straight from birth: just as some people are blue-eyed and others dark-eyed, due to this part being of this sort, so too 10
some are lucky, others unlucky.

For that they do not accomplish things correctly due to practical wisdom is clear; for practical wisdom is not non-rational, but has a reason because of which it acts the way it does, while the lucky could not say what the cause of their accomplishing things correctly is (for then it would be due to a craft). Further, they are manifestly foolish, not because they are so about other things (for there would be nothing 15
strange in that—for example, Hippocrates was a geometer, but seemed stupid and foolish about other things, and so lost a lot of money to the customs officers in Byzantium), but rather because in the very areas in which they are lucky, they are foolish. For as regards navigation, it is not the cleverest who are lucky, but rather it is 20
like in throwing dice, where the one gets nothing, while the other throws in accord with his being by nature lucky.

Or is it due to being loved, as they say, by a god, and is the correct accomplishment of things due to something external? For example, a badly built ship often sails better, although not because of itself, but because it has a good navigator. Does the 25
lucky person, in this way, have a daimonic thing as his good navigator? But it would be strange for a god or a daimon to love someone of that sort rather than the best and most practically wise person.

If, then, it is necessary for someone to accomplish things correctly either by nature, or by understanding, or by [divine] protection, and it is not two of these, it would be by nature that the lucky are lucky.

But surely nature is the cause of what is always in the same way or what holds for the most part, while luck is the contrary. If, then, to be successful in accomplishing 30

things correctly in a way that goes contrary to reasonable expectation seems to be characteristic of luck, but if indeed having good luck is due to luck, its cause would not be the sort of thing that is the cause of what is always the same or holds for the most part. Further, if it is because of being of such-and-such a sort that one is successful or unsuccessful in accomplishing things correctly (as it is because he is blue-eyed that he is not sharp-sighted[115]), it is not luck that is the cause but nature. Therefore, he is not lucky but, as it were, naturally gifted. So one would have to say this, that those that we say are lucky are not so because of luck. Therefore, they are not really lucky; for the lucky ones are those for whom luck is a cause of good things.

1247b1

But if this is so, will luck not exist at all, or will it exist but not be a cause? But in fact it is both necessary that it exist and be a cause. Therefore, it will be a cause of good or bad things for certain people. But if we are to remove it altogether and say that nothing is due to luck, but that we, though there is another cause, because we do not see it, say that luck is the cause (which is why in defining luck people posit that it is a cause that [appears to be] non-rational to human rational calculation, on the supposition that it is a certain nature), this would be another problem.

But since we see some people being lucky just once, why would they not also accomplish things correctly again and again because of the same thing? (For of the same thing the same thing is the cause.) This, therefore, will not be a matter of luck. But whenever the same thing results from causes that are indefinite and indeterminate, the result will be good or bad, but there will not be scientific knowledge of it through experience, since otherwise certain people would have learned to be lucky, or else indeed all the sciences, as Socrates said,[116] would be sorts of good luck. What, then, prevents things of this sort from often happening in succession to someone, not because he is of such-and-such a sort, but like being always blessed [with good luck] in throwing dice?

But now what? Won't there, then, be some impulses present in the soul that stem from rational calculation, and others that stem from non-rational desire? And are the latter not prior? For if the impulse caused by appetite for the pleasant, that is, the desire, exists by nature, then by nature, at any rate, all would proceed toward the good. If, then, certain people are naturally gifted (as singers without the scientific knowledge of how to sing are well endowed by nature in this way) and are impelled without reason in the way that nature naturally does, and have an appetite for what one should, when one should, and as one should, these people will accomplish things correctly, even if they are in fact foolish and without reason, just as the others will sing well though they are not capable of teaching it. People of this sort, who, without reason, for the most part accomplish things correctly, are lucky. Therefore, the lucky people would be so by nature.

Or is good luck said of things in many ways? For some things are done due to impulse and to deliberately choosing to do them, while others are not, but quite the contrary. Even in those cases in which people seem to have rationally calculated

115. *GA* 779b34–780a14.

116. Plato, *Euthydemus* 279d.

badly, we say that their accomplishing things correctly was also a matter of luck; and, again in these cases, if they wished for another and lesser good than they got. Therefore, it is possible for the latter people to be lucky because of nature; for their impulse and desire, being for the thing they should, did accomplish things correctly, though their rational calculation was silly. And for those in this position, whenever their rational calculation seems not to be correct, their appetite, being the cause of it, saved them by being correct by luck (although sometimes someone reasons thusly because of appetite and is unlucky). But then in the other cases how will good luck be in accord with a naturally good disposition of desire and appetite? But surely either good luck here and in the other cases is the same, or else there are several sorts of good luck, and luck is twofold.

But since we see that some people are lucky contrary to all the sciences and all correct rational calculations, it is clear that what would be the cause of good luck is something else. But is that good luck or not? If a person has an appetite for what one should and when one should, human rational calculation, at any rate, could not be the cause of this; for that for which the appetite is natural, at any rate, is certainly not altogether without reason, but does get destroyed by something. He seems, then, to be lucky, because luck is a cause of things that are contrary to reason, and this case is contrary to reason; for it is contrary to scientific knowledge and the universal. But, as looks to be the case, it is not due to luck, though it seems to be due to it. So this argument does not prove that good luck is by nature, but rather that not all those who seem to be lucky accomplish things correctly because of luck, but that some do so because of nature. Nor does it prove that luck is in no way the cause of anything, but rather that it is not the cause of all the things it seems to be the cause of.

One might, however, raise a puzzle about this, as to whether luck is the cause of this very thing, having an appetite for what one should and when one should. Or in this way, at any rate, will it be the cause of everything? For it will even be the cause of understanding and deliberating; for one certainly does not deliberate after having deliberated about it, and having in turn deliberated about that, but there is a starting-point; nor does one understand, after having understood before understanding, and so on without limit. Therefore, the understanding is not the starting-point of understanding, nor is deliberation the starting-point of deliberation. What else could this be, then, except luck? So everything is due to luck.

Or is there some starting-point with no other external to it, which, because it is itself of this sort, is capable of doing this sort of thing? This is what we are seeking: what the starting-point of movement in the soul is. It is clear, then, that just as in the universe, so there too, [the] god moves everything. For the divine thing in us in a way moves everything. Of reason, however, the starting-point is not reason, but something superior. But what except [the] god is superior even to scientific knowledge? For virtue is an instrument of the understanding.[117]

117. 1246ᵇ12.

And it is because of this, as I said earlier, that people are called "lucky" who, if they are impelled to, accomplish things correctly, though they are non-rational. And for them it is not advantageous to deliberate; for they have the sort of starting-point that is greater than understanding and deliberation (while those who have reason do not have this) and are divinely inspired, but cannot [deliberate]. For though non-rational they are successful. Also, the prophesizing of practically wise and theoretically wise people is quick, and the only thing it must not receive is the prophesizing based on reason. But in some people it is due to experience and in others due to habit, in place of the use of examination, and these prophesizings are due to the god; and this sees well what will be and what is, especially in those whose reason is released in this way. That is why passionate people also have vivid dreams; for the starting-point seems to be stronger because reason is released, just as blind people remember better when released from their relationship with visible things, because what does the remembering is stronger.

It is evident, then, that there are two forms of good luck, the one divine (which is why the lucky person seems to be correct because of a god, and this is the one who in accord with impulse tends to be correct), while the other is the one who goes contrary to impulse. Both are non-rational. And the former is rather a continuous sort of good luck, while the latter is not continuous.

8.3
Noble-Goodness, Complete Virtue, and Correct Reason

About each particular virtue we have spoken previously.[118] But since we have determined the capacity of each of them separately, we must also define precisely the virtue composed of them, which we have already called "noble-goodness."[119] That it is necessary, then, for anyone who will truly get this title to have the particular virtues is evident. For it cannot be otherwise in other cases either; for no one is healthy in his body as a whole, but not in any part of it; rather, it is necessary for all, most, or the most controlling parts[120] to be in the same state as the whole.

Being good and being noble-and-good are different not only in name but also intrinsically. For of all goods, the ones choiceworthy for their own sake are ends. But of these the noble ones are all those that are praiseworthy because of themselves. For these are the ones that the actions due to which are praiseworthy and that are also praiseworthy themselves—both justice itself and just actions, and temperate actions (for temperance too is praiseworthy). But health is not praiseworthy (for neither is

118. About the virtues of character in *EE* 3 and 4 (= *NE* 5) and about those of thought in *EE* 5 (= *NE* 6).
119. *NE* 1124a4, 1179b10.
120. *GA* 776b5–6.

the work it does), nor is [acting] strongly (for neither is strength). They are good, but they are not praiseworthy. Likewise, this is also clear by induction in other cases.

A good person is one for whom things that are good by nature are good; for the fought-about goods and the goods believed to be the greatest ones (honor, wealth, virtues of body, strokes of good luck, and capacity), though good by nature, can be harmful to certain people because of their states. For a person who is foolish, or is unjust or intemperate, would get no benefit from making use of them, just as a sick person would get none from making use of the nourishment of a healthy one, or a weak, deformed one of the adornments of a healthy, whole one. But a person is noble-and-good because good things that are noble because of themselves belong to him, and because he is a doer of noble actions also for their own sake. And noble things are both the virtues and the works that are due to virtue.

There is a certain political state [of character], however, such as the Spartans and others of this sort have. This is a state of this sort. For there are people who think that they should possess virtue, but for the sake of the things that are by nature good. That is why they are good men[121] (for the natural goods are good for them), but they do not possess noble-goodness. For the things that are noble because of themselves do not belong to them, while those to whom they do belong because of themselves and who deliberately choose them are noble-and-good; and not only these things, but also the ones not noble by nature, but rather good by nature, are noble for these people. For things are noble whenever what people do them for the sake of, and choose them for the sake of, is noble. That is why the things that are good by nature are noble for the noble-and-good person; for the just is noble, and this is the just in accord with worth; and this person is worthy of these things. And what is appropriate is noble. And these things—wealth, good breeding, capacity—are appropriate for this person. So for the noble-and-good person the same things are both advantageous and noble. But for ordinary people there is a discordance here; for things that are unconditionally good are not also good for them, though they are good for the good person. And for the noble-and-good person they are also noble; for he does many noble actions because of themselves. But the person who thinks that he should possess the virtues for the sake of external goods does noble actions [only] coincidentally. Noble-goodness, then, is complete virtue.

Also as regards pleasure, it has been stated[122] what sort of thing it is and in what way it is good, and that the things that are unconditionally pleasant are also noble and the unconditionally good ones pleasant. And pleasure does not come about except in action. That is why the truly happy person will also live most pleasantly, and why it is not pointlessly that human beings think this.

But since there is a certain defining mark also for the doctor, by reference to which he judges what is a healthy body and what is not, and up to what point each thing

121. Reading ἀγαθοὶ for the mss. ἄγριοι ("wild men").
122. 1237ᵃ6–7, *NE* 1152ᵇ25–1153ᵃ35, 1153ᵇ9–12, 1154ᵇ15–31.

must be produced (and if it is produced well the body is healthy, but no longer so if it is too little or too much); in a similar way too for the excellent person, as regards actions and choices that are good by nature but not praiseworthy, there must be a certain defining mark for the possession and choice—and as regards the avoidance of abundance or scarcity—of wealth and of other results of good luck. Previously, it was said[123] that this [defining mark] was "as reason [prescribes]," but this is as if someone were to say in matters of nourishment that it is "as medicine and its reason [prescribe]." It is true, but not perspicuous.

Just as in other areas, then, one must live by reference to the ruling element, and by reference to the state and activity of the ruling element, as a slave by reference to that of his master, and each thing by reference to its own ruling starting-point. But since a human being too is by nature composed of a ruler and a ruled, each one would also have to live by reference to its own proper ruling starting-point. But this is twofold; for medicine and health are ruling starting-points in distinct ways (the former is for the sake of the latter). This is the way it is as regards what contemplates. For the god is not a prescriptive ruling starting-point, but that for the sake of which practical wisdom prescribes, since [the god], at any rate, is in need of nothing. (The for-the-sake-of-which is twofold. The distinction has been made elsewhere.[124]) Whatever choice and possession, then, of natural goods—whether goods of the body, wealth, friends, or other goods—will most of all produce the contemplation of the god, this is the best one, and this the noblest defining mark; and whatever choice, whether because of deficiency or because of excess, prevents serving the god and contemplation—this is a bad one. And this holds for the soul, and this is the best defining mark, to perceive as little as possible the other part of the soul, insofar as it is such.

What the defining mark is for noble-goodness, then, and what the target is for the unconditional goods, let it be stated thus.

123. E.g., 1220b28, 1222a34, 1233b6.

POLITICS*

BOOK 1

1.1
The City and Its Rule

Since we see every city to be a sort of community, and every community to be composed for the sake of some good (for everyone does every action for the sake of what seems to be good), clearly, then, while every community aims at some good, the community that has the most control of all, and encompasses all the others, aims both at the good that has the most control of all and does so to the highest degree. And this community is the one called a "city," the community that is political. **1252a1**

Those who think[1] that the positions of politician, king, household manager, and master [of slaves] are the same are not correct. For they think that each of these differs with regard to large or small number, but not in form—for example, if someone rules few people, he is a master, if more, a household manager, if still more, he has the position of politician or king—the assumption being that there is no difference between a large household and a small city. And as for the positions of politician and king, they say that someone who is himself in charge has the position of king, while someone who, in accord with the reasons belonging to this sort of science, takes his turn at ruling and being ruled has the position of politician. But these claims are not true.

What is meant will be clear, if we investigate the matter in accord with our normal method of inquiry. For as in other cases, a composite must be analyzed until we reach things that are incomposite (for these are the smallest parts of the whole), so too it is by investigating the parts of which a city is composed that we will see better both how these differ from each other, and whether or not it is possible to gain some craft-like expertise concerning each of the things we have mentioned.

1. E.g., Plato, *Statesman* 258e–261a.

1.2
The Emergence and Naturalness of the City

If we were to see how these things grow naturally from the start, we would in this way,
25 in this case as in the other ones, get the best theoretical grasp on them. First, then, those who are incapable of existing without each other necessarily form a couple, as female and male do for the sake of procreation (they do not do so from deliberate choice, but, as in the case of the other animals and plants, because the urge to leave behind something of the same sort as themselves is natural), and as what rules by
30 nature and what is by nature ruled do for the sake of preservation. For if something is capable of looking ahead by using its thought, it is by nature a ruler and by nature a master, while whatever can labor by using its body is ruled and is by nature a slave. That is why the same thing is advantageous for both master and slave.

1252b1 By nature female is distinguished from slave. For, unlike the blacksmiths who make the Delphian knife, nature produces nothing in a stingy way, but instead makes one thing for one [thing]; for each one of the instruments will be completed best if it serves for one work rather than many. Among barbarians, however, a woman and a
5 slave occupy the same position. The cause of this is that they have no element that is by nature a ruler, but rather their community is that of male and female slave. That is why the poets say "It is reasonable for Greeks to rule barbarians,"[2] on the supposition that a barbarian and a slave are by nature the same.

From these two communities, then, the household was first to arise, and Hesiod
10 was correct when he said in his poem, "First and foremost a house, a woman, and an ox for the plow."[3] For to poor people an ox takes the place of a servant. The community composed to satisfy everyday needs, then, is the household in accord with nature, whose members are called "meal-sharers" by Charondas and "manger-sharers" by Epimenides the Cretan.

15 The first community, consisting of several households, for the sake of satisfying needs other than everyday ones, is the village. And above all the village in accord with nature seems to be a colony of the household, consisting as it does of what some[4] have called "sharers of the same milk," sons and the sons of sons. That is why cities were at first ruled by kings, as [barbarian] nations still are; for those who came together were
20 living under kingly rule; for every household is ruled by the eldest as a king. And so the same holds in the colonies, because of the kinship [of the villagers]. This is what Homer is describing when he says: "Each one lays down the law for his own wives and children."[5] For they were scattered about, which is how people used to dwell in ancient times. And it is because of this that all people say that the gods too are ruled

2. Euripides, *Iphigenia in Aulis* 1266, 1400.
3. *Works and Days* 405.
4. Identity unknown.
5. *Odyssey* 10.114–115.

by a king, because they themselves were ruled by kings in ancient times, and some still are. And human beings model not only the forms of the gods on their own but their mode of life as well.

The community, coming from several villages, when it is complete, is the city, once it has already reached (one might almost say) the limit of total self-sufficiency. It comes to be for the sake of living, but it exists for the sake of living well. That is why every city exists by nature, if indeed the first communities also do. For this one is their end, and nature is an end; for what each thing is when its coming to be has been completed, this we say is the nature of each—for example, of a human being, of a horse, or of a household. Further, the for-the-sake-of-which—the end—is best, and self-sufficiency is both end and best.

From these considerations, then, it is evident that a city is among the things that **1253ª1** exist by nature, that a human being is by nature a political animal, and that anyone who is without a city, not by luck but by nature, is either a wretch or else better than human, and, like the one Homer condemns, he is "clanless, lawless, and homeless";[6] for someone with a nature of this sort has at the same time an appetite for war, like an isolated piece in a game of checkers.

It is also clear why a human being is more of a political animal than any bee or any other herd animal. For nature does nothing pointlessly, as we say, and the human being alone among the animals has speech. A voiced sound is a sign of what is pleasant or painful, which is why it is also possessed by the other animals (for their nature does extend this far, to having the perception of pleasure and pain and signifying them to each other). But speech is for indicating what is advantageous or harmful, and so too what is just or unjust; for this is special to human beings, in comparison to the other animals, that they alone have perception of the good and the bad, the just and the unjust, and the rest. And it is community in these that makes a household and a city.

Also the city is prior in nature to the household and to each of us individually. For it is necessary for the whole to be prior to the part; for if the whole body is put to death, there will no longer be a foot or a hand, except homonymously, as one might speak of a stone "hand" (for, once dead, the hand will be like that). But everything is defined by its work and by its capacity, so that when they are no longer in that condition they must not be said to be the same things but homonymous ones. It is clear, then, that the city both exists by nature and is prior in nature to the individual; for if an individual is not self-sufficient when separated, he will be in a similar state to that of the other parts in relation to the whole. And anyone who cannot live in a community with others, or who does not need to because of his self-sufficiency, is no part of a city, so that he is either a wild beast or a god.

By nature, the impulse toward this sort of community exists in everyone; but the person who first put one together was also the cause of very great goods. For just as when completed a human being is the best of the animals, so when separated

6. *Iliad* 9.63–64. Homer is describing a man who "loves fighting with his own people."

from law and judicial proceeding he is worst of all. For injustice is harshest when it possesses weapons, and a human being grows up possessed of weapons for practical wisdom and virtue to use, which may be used for absolutely contrary purposes. That is why he is the most unrestrained and most savage of animals when he lacks virtue, as well as the worst as regards sex and food. But justice is something political; for justice is a political community's order, and justice[7] is judgment of what is just.

1.3
The City's Parts; Household, Master, and Slave

1253b1 Since it is evident from what parts the city is composed, it is necessary first to speak about household management; for every city is composed of households. And the parts of household management correspond in turn to the parts of which the household is composed, and a complete household is composed of slaves and free people. But since one must first inquire about each thing in terms of its smallest parts, and the primary and smallest parts of a household are master and slave, husband and wife, and father and children, one must investigate these three things to see what each of them is and what sort of thing each must be. The three in question are mastership, "marital" science (for the union of woman and man is nameless), and, third, "procreative" science (for this too has not been given a name that is special to it). Let these three that we mentioned stand. But there is also a part, which some believe to be identical to household management, and others believe to be its largest part; one must get a theoretical grasp on how things stand with it too. I mean what is called "the craft of wealth acquisition."

But let us first discuss master and slave in order that we may see the things that are related to necessary use, and also whether we can acquire something in the way of knowledge about these things that is better than what it is supposed at present. For some people believe that mastership is a sort of science, and that household management, mastership, politics, and kingship are all the same, as we said at the start.[8] But others believe that it is contrary to nature to be a master;[9] for it is by law that one person is a slave and another free, while by nature there is no difference between them. That is why to be a master is not just either; for it is based on force.

1.4
The Nature of the Slave

Since property is part of the household, the craft of property acquisition is also a part of household management; for it is impossible either to live or to live well without

7. Reading ἡ δὲ δίκη.
8. 1252a7–16.
9. E.g., Alcidamas of Elaea.

the necessities. So, just as it is necessary for the specialized crafts to have their proper instruments if they are going to do their works, the same applies to a household manager. Among instruments, however, some are inanimate and some are animate—for example, for the ship's captain a rudder is an inanimate instrument, while his lookout is an animate one; for in the crafts an assistant is in the form that consists of instruments. So too a piece of property is an instrument for living, and property [in general] a number of instruments of this sort, a slave is a sort of animate piece of property, and all assistants are like instruments for [using] instruments. For if each instrument could do its own work on command or by anticipating instructions, and if—like the statues of Daedalus or the tripods of Hephaestus (which the poet describes as having "entered the assembly of the gods of their own accord"[10])—shuttles wove cloth by themselves, and plectra played the lyre, an architectonic craftsman would not need assistants and masters would not need slaves.

What are commonly said to be instruments are productive instruments, while a **1254^{a}1** piece of property is a practical one; for something comes from a shuttle beyond the use of it, but from a piece of clothing or a bed only the use comes. Further, since production and action differ in form, and both need instruments, their instruments must differ in the same way as they do. But life is action, not production. That is why a slave is an assistant in the things related to action. And something is said to be a piece of property in the same way as it is said to be a part. For a part is not just a part of another thing, but is wholly that thing's, and the same also holds of a piece of property. That is why a master is just his slave's master, not simply his, while a slave is not just his master's slave, but wholly his.

From these considerations it is clear what the nature and capacity of a slave are. For anyone who, though human, is by nature not his own but someone else's is by nature a slave. And a human being is someone else's when, though human, he is a piece of property, and a piece of property is an instrument that is for action and separate [from its owner].

1.5
Natural Slaves (1)

But whether anyone is like that by nature or not, and whether it is better and just for anyone to be a slave or not (all slavery being, on the contrary, against nature), must be investigated next. And it is neither difficult to get a theoretical grasp on the answer by argument nor to learn it from what actually happens. For ruling and being ruled are not only necessary, they are also advantageous, and some things are set apart straight from birth, some to rule, others to be ruled. And there are many forms of rulers and ruled, and rule over the better ruled is always better—for example, rule over human

10. Homer, *Iliad* 18.376.

beings is better than rule over wild beasts; for a work that is completed by something better is a better work, and where one thing rules and another is ruled, there is a certain work belonging to these; for in whatever is composed of a number of things, whether continuous with each other or discontinuous, and becomes one communal thing, a ruler and a ruled are always seen in all of them, and this is present in animate beings on the basis of their entire nature; for even in things that do not share in living some rule exists—for example, in a harmony.[11] But these issues presumably lie far outside our investigation.

In the first place, a living being is composed of soul and body, and of these, by nature, the former is the ruler, the latter the ruled. And one must investigate what is natural in things whose condition is in accord with nature, not in the corrupted ones. That is why the human being to get a theoretical grasp on is one that is in the best possible condition, both of soul and of body, since in him this is clear; for in depraved people, and those in a depraved condition, the body will often seem to rule the soul, because their condition is base and in disaccord with nature.

But it is, as we were saying, in a living being that one can first get a theoretical grasp on both the rule of a master and political rule; for the soul rules the body with the rule of a master, while the understanding rules desire with political rule or kingly rule. In these cases, it is evident that it is in accord with nature and advantageous for the body to be ruled by the soul, and for the affective part to be ruled by the understanding and the part that has reason, while if the relation were equal or reversed it would be harmful to all concerned. And again in the case of a human being and the other animals the same holds; for domestic animals are by nature better than wild ones, and it is better for all of them to be ruled by human beings; for in this way they secure their preservation. Further, the relation of male to female is that of what is better by nature to what is worse, and that of ruler to ruled. And it must be the same way in the case of all human beings.

Those people, then, who are as different [from others] as body is from soul or wild beast from human being (and they are in this condition if their work is to use their bodies, and this the best thing to come from them)—those people are by nature slaves, and it is better for them to be ruled with this rule, if indeed it is also better for the other things mentioned. For he is by nature a slave who is capable of belonging to someone else, belongs to someone else because of this, and shares in reason to the extent of perceiving it but not to the extent of having it himself. For the other animals assist not because they perceive[12] the reason but because of feelings. Also, the difference in the use made of them is small; for in relation to the necessities bodily help comes from both, both from slaves and from domestic animals.

Nature tends indeed to make the bodies of free people and slaves different, the latter strong enough to be used for necessities, the former upright in posture and

11. The reference is to the *mêsê* or *hêgemôn* ("leader"), which is the dominant note in a chord.
12. Reading αἰσθανόμενα.

useless for doing that sort of work, but useful for political life—which is itself divided into what is useful for war and what is useful for peace. But the contrary also often happens, some have the bodies of freemen, while others have the souls. Since this, at any rate, is evident: if people were to become in body alone as distinguished as the statues of the gods, everyone would say that those who fell short deserved to be their slaves. And if this is true in the case of the body, it is even more just to make this distinction in the case of the soul. But it is not as easy to see the beauty of the soul as it is to see that of the body.

It is evident, therefore, that by nature some people are free and others are slaves, for whom slavery is both advantageous and just. **1255^{a}1**

1.6
Natural Slaves (2)

But that those who make the contrary claim are also correct in a way is not difficult to see. For someone is said to be being ruled as a slave, or to be a slave, in two ways. For by law too a person can be a slave or be ruled as a slave; for the law [in question] is a sort of agreement by which what is conquered in war is said to belong to the conquerors. Against the justice of this, then, many of those versed in the law bring a writ of illegality, analogous to that brought against a [legislative] speaker, on the grounds that it is a terrible thing if what is overcome by force is going to be the slave of, and ruled by, what is able to exert force and is superior in power. And some hold the latter view, others the former, even among the wise.

The cause of this dispute, and what produces a going back-and-forth in the arguments, is that in a way virtue, when it is equipped with resources, is most able to use force, and what conquers is always superior in something good, so that it seems that there is no force without virtue, the dispute being only about justice. For because of this view one side believes that justice is goodwill,[13] while the other believes that justice is precisely this—that the stronger rule. At any rate, if these arguments are left aside, the other arguments have neither strength nor anything to persuade us that the one who is better in virtue should not rule, that is, be master.

Some people cleave exclusively to what they think is a sort of justice (for the law is something just), and maintain that enslavement in war is just. But at the same time they say that it is not just; for it is possible for wars to be started unjustly, and there is no way in which someone would say that the person who does not deserve to be in a condition of slavery is a slave—otherwise, it could turn out that those believed to be the most well-bred are slaves or the children of slaves, if any of them happen to be taken captive and sold. That is why indeed the people who hold this view are not willing to say that these are slaves, but only that barbarians are. And yet, in saying

13. Reading εὔνοια.

this, what they are seeking is nothing other than what is by nature a slave—which is precisely what we spoke about at the start; for they have to say that some people are slaves everywhere, others nowhere.

It is the same way with good breeding; for people think of themselves as well-bred not just when they are in their own country, but wherever they are, while they think of barbarians as well-bred only at home, on the supposition that it is one thing to be unconditionally well-bred and free, and another to be so but not unconditionally—as Theodectes' Helen does when she says: "Sprung from divine roots on both sides, who would think that I deserve to be called a 'hired servant'?"[14] But when people say this, it is by nothing but virtue and vice that they are defining slave and free, well-bred and ill-bred. For they think that in just the way that human comes from human, and wild beast from wild beast, so too good people come from good ones. But, though nature often tends to do this, it is nonetheless unable [always] to do so.

It is clear, then, that there is some reason for the dispute and that the one lot are not always slaves by nature nor the other free. But it is also clear that in some cases there is a distinction of this sort—cases where it is advantageous and just[15] for the one to be ruled as a slave and the other to rule as a master, and where the one should be ruled and the other should rule with the rule that is natural for him to exercise (so that he is in fact ruling as a master), and where misrule is disadvantageous to both. For the same thing is advantageous for both part and whole, body and soul, and a slave is a sort of part of his master—a sort of living but separate part of his body. That is why there is in fact a sort of mutual advantage and mutual friendship for such masters and slaves as deserve to be by nature so related. When their relationship is not that way, however, but is in accord with law, and they have been subjected to force, the contrary holds.

1.7
Mastership and Slavecraft

It is also evident from these considerations that the rule of a master and the rule of a politician are not the same, and that the sorts of rule are not all the same as each other either, as some people claim. For one is rule over people who are by nature free, the other over slaves. Rule by a household manager is a monarchy (for every household has one ruler); rule of a politician, one the other hand, is rule over people who are free and equal.

Someone is said to be a master not in virtue of his scientific knowledge but in virtue of being such-and-such a sort of person. The same is true of both slave and free. Nonetheless, there could be such a thing as mastership or slavecraft—for example, of

15. Reading καὶ δίκαιον.

the sort that was taught by the man in Syracuse,[16] who, for a fee, used to teach slave boys their day-to-day services. Lessons in such things as these might well be extended to include cooking and other services of that kind. For different slaves have different works, some of which are more estimable, others more concerned with providing the necessities—"Slave before slave, master before master," as the proverb says.[17]

All sciences of this sort, then, are the business of slaves, while mastership is the science of using slaves. For being a master does not consist in the acquiring of slaves but in the using of them. But there is nothing grand or dignified about this science; for what the slave needs to have scientific knowledge of how to do is what the master needs to have scientific knowledge of how to prescribe. That is why, for those who have the resources not to bother with such things, a steward takes on this office, while they themselves engage in politics or do philosophy. As for the science of acquiring slaves (that is, of doing so justly), it is different from both of these, and is a sort of warfare or hunting.

As regards master and slave, then, let the distinctions be made in this way.

1.8
Property Acquisition and Household Management

Let us now get a general theoretical grasp on all property and the craft of wealth acquisition, in accord with the way laid down,[18] since in fact a slave has turned out to **1256ᵃ1** be a part of property. The first puzzle one might raise is whether the craft of wealth acquisition is the same as household management, or a part of it, or an assistant to it. And if it is an assistant, whether it is in the way that shuttle-making is to weaving, or in the way that bronze-smelting is to statue-making; for these do not assist in the same way, but rather the first provides instruments, while the second the matter. (By "the matter" I mean the underlying subject from which a certain product is made—for example, wool for the weaver and bronze for the statue-maker.)

But it is clear that household management is not the same as the craft of wealth acquisition (for to the former it belongs to use resources, to the latter to provide them). For otherwise what science will there be that uses what is in the household, except that of household management? But whether the craft of wealth acquisition is a part of household management or a science of a distinct form is a matter of dispute; for if it belongs to someone who possesses the craft of wealth acquisition to get a theoretical grasp on the various sources of wealth and property, and property[19] and wealth include many parts, [one must investigate] first whether farming—and, in

16. Identity unknown.
17. Philemon, Fr. 54 Kock.
18. I.e., analysis into parts. See 1252ᵃ17–23, 1253ᵇ1–8.
19. Reading ἡ δὲ κτῆσις.

universal terms, the supervision and acquisition of nourishment—is a part of wealth acquisition or some distinct kind of thing.

But there are in fact many forms of nourishment, and that is also why the ways of life of both animals and human beings are many; for it is impossible to live without nourishment, so that differences in nourishment have produced different ways of life among the animals. For some wild beasts live in herds and others live scattered about, whichever is advantageous for getting their nourishment, because some of them are carnivorous, some herbivorous, and some omnivorous. And so with a view to their convenience and their preference in these matters, nature has made their ways of life different. And since it is not the same things that are naturally pleasant to each, but rather different things to different ones, among the carnivores and herbivores themselves the ways of life are different.

The same is also true of human beings. For their ways of life differ greatly. The most idle are herders; for they—without effort and while at leisure—get their nourishment from their domestic animals. Although, when it is necessary for their herds to change pasture, they too have to move around with them, as if they were farming a living farm. Others live from hunting, and different sorts from different sorts of it: some from raiding; some—those who live near lakes, marshes, rivers, or a suitable sort of sea—live from fishing; and some off birds or wild beasts. But the human kind that is most numerous lives off the land and off cultivated crops.

The ways of life, then—at any rate, those that have the work they do arise naturally[20] and do not provide nourishment through exchange or commerce—are pretty much these: nomadic, raiding, fishing, hunting, farming. But some people live pleasantly by mixing together several of these, supplementing their mode of life where it happens to be deficient with regard to self-sufficiency—for example, some live both a nomadic and a raiding life, others, both a farming and a hunting one, and similarly in the case of the others, each passing their time in the way need, together with other things, necessitates.

Property of this sort, then, is manifestly given by nature itself to all living things both immediately from when they are first generated, and so too when they have completely developed. And in fact some animals produce at the start, together with their offspring, enough nourishment to last the latter until such time as it is able to get it for itself—for example, those that produce grubs or eggs. Animals that give birth to live offspring, on the other hand, carry nourishment for their offspring in their own bodies for a certain period—the natural substance called "milk." It is likewise clear, then, in the case of developed things too, that one must think both that plants are for the sake of animals, and that the other animals are for the sake of human beings, domestic ones both for using and eating, and if not all, nonetheless most, wild ones for nourishment and other sorts of support, so that clothes and other instruments may be got from them. If, then, nature makes nothing incomplete and

20. 1257a19–21.

nothing pointlessly, it must be that nature made all of them for the sake of human beings. That is why even warfare (for hunting is a part of it), will in a way be by nature a craft of property acquisition—one that should be used not only against wild beasts but also against those human beings who are naturally suited to be ruled but unwilling to be, on the supposition that this sort of warfare is by nature just.

One form of craft of property acquisition, then, is by nature a part of household management, in that either there must be available, or it itself must arrange to make available, a store of what is both necessary for living and useful to the community of city or household. At any rate, true wealth seems to consist of things of this sort. For self-sufficiency in this sort of property, with a view to living the good life, is not unlimited, as Solon in his poetry says it is: "No boundary to wealth has been laid down for human beings."[21] For one has been laid down just as in the other crafts; for there is no instrument of any craft that is unlimited in quantity or size, and wealth is a collection of instruments for household management and politics.

It is clear, then, that there is a natural sort of craft of property acquisition for household managers and politicians, and what the cause of this is.

1.9
Wealth Acquisition and the Nature of Wealth

But there is another kind of craft of property acquisition, which they most of all call—and justly so—"the craft of wealth acquisition." It is because of it that wealth and property seem to have no limit. And many people think that the craft of wealth **1257a1** acquisition is one and the same as what was spoken about, because the two are close neighbors. But it is neither the same as what was said nor all that far from it. One of them exists by nature, while the other does not exist by nature, but comes more from a sort of experience and craft knowledge.

Concerning the latter, let us take the following as our starting-point. For each piece of property has two uses, both of which are uses of it intrinsically, but not uses of it intrinsically in the same way. Instead, one properly belongs to the thing, while the other does not properly belong to it—for example, as regards a shoe, its use in wearing it and its use in exchange. For both are uses to which a shoe can be put; for in fact someone who exchanges a shoe, in return for money or nourishment, with someone who needs a shoe, is using the shoe insofar as it is a shoe. But this is not the use that properly belongs to it; for it did not come to exist for the sake of exchange. And it is the same way with the other pieces of property as well. For the craft of exchange applies to all of them, and first started from the natural circumstance of some human beings having more than enough of these things and less of others. (It is also clear from this that the craft of commerce does

21. Fr. 1.71 Diehl.

not by nature belong to the craft of wealth acquisition; for it was up to the point at which they had enough that it was necessary for them to engage in exchange.) It is evident, then, that in the first community, that is, the household, there is no work for exchange, but only when the community already consists of more members. For the members of the household used to share all their own things, while those in separate households in turn shared many other things, and it was necessary to make a trade of these in accord with their needs, as many barbarian peoples still do, through exchange. For they exchange useful things for other useful things, but nothing more than that—for example, they take and give wine in return for wheat, and so on with everything else of this sort.

This sort of craft of exchange, then, is neither contrary to nature nor is it any form of craft of wealth acquisition; for it existed as a replenishment of a self-sufficiency that is in accord with nature. Nonetheless, the craft of wealth acquisition arose from it, and did so in accord with reason. For when supplies came from increasingly foreign sources, because of importing what was needed and exporting the surplus, the use of money had of necessity to be devised. For not all the natural necessities are easily transportable. And that is why with a view to exchange people agreed with each other to give and take something that was itself one of the useful things and that was easily adaptable to the needs of living—for example, iron, silver, and anything else of that sort. At first, its value was determined simply by size and weight, but finally people also put a stamp on it, in order to save themselves the trouble of measuring it; for the stamp was put on to signify the amount.

1257b1 Once money was devised, from necessary exchange the second of the two forms of crafts of wealth acquisition arose, the craft of commerce. At first, it was presumably a simple affair, but then through experience it became more of a craft of how and from what sources the greatest profit could be made through exchange. That is why it seems that the craft of wealth acquisition is most of all concerned with money, and that its work is to be able to get a theoretical grasp on the sources from which a quantity of wealth will come; for it is productive of wealth and money. For wealth in fact is often assumed to be a quantity of money, because this is what the craft of wealth acquisition and the craft of commerce are concerned with.

But sometimes, contrariwise, money seems to be empty trash and to exist entirely by convention and not by nature at all, because, when changed by its users, it has no value and is useless for acquiring any of the necessities, and often someone who is rich in money will be unprovided with the nourishment that is necessary. And yet it is absurd for something to be wealth if someone well provided with it will die of hunger, like Midas in the fable, when everything set before him turned to gold in answer to his own greedy prayer. That is why people seek another notion of what wealth and the craft of wealth acquisition are, and correctly so. For the craft of natural wealth acquisition and natural wealth are of another sort, and it is [a part of] household

management, while the craft of commerce is productive of goods, not in every way, but through their exchange. And it seems to be concerned with money; for money is the element and limit of exchange.

And the wealth that derives from this sort of craft of wealth acquisition is unlimited. For just as the craft of medicine aims at unlimited health, and each of the crafts aims to achieve its end in an unlimited way (for this is what they most of all wish to do), while the things that further the end are not unlimited (for the end is the limit of all of them), so too of this sort of craft of wealth acquisition there is no limit concerning its end, but its end is wealth of this sort: the possession of money. The sort of craft of wealth acquisition that is a part of household management, on the other hand, does have a limit; for this [unlimited wealth] is not the work of household management. That is why, in one way it appears to be necessary for all wealth to have a limit, and yet, if we look at what actually happens, the contrary seems true; for all acquirers of wealth go on increasing their money without limit. The cause of this is the close relation between the two. For the use, being of the same thing, goes back and forth between the two sorts of crafts of wealth acquisition. For the use is of the same property in both cases, but not with respect to the same thing. Instead, in one case the end is increase, in the other, something else. So it seems to some people that this is the work of household management, and so they end up thinking that they should either preserve the substantial amount of money they have or increase it without limit.

The cause, though, of their being so disposed is that what they take seriously is living, not living well. And since their appetite for living is unlimited, they also have an appetite for an unlimited amount of what is productive of it. But even those who do aim at living well seek what furthers bodily gratification, so that, since this too appears to depend on having property, they spend all their time acquiring wealth. And the other form of craft of wealth acquisition arose because of this. For because their gratification lies in excess, they seek the craft that is productive of the excess in gratification. And if they cannot provide it through the craft of wealth acquisition, they try to do so by means of some other cause of it, using each of the capacities not in accord with nature. For it does not belong to courage to produce wealth but to produce confidence in the face of danger, nor does it belong to generalship or medicine to do so, but rather to produce victory and health, respectively. These people, however, make all of these into the crafts of wealth acquisition, on the supposition that acquiring wealth is the end, and that everything must further the end.

The unnecessary craft of wealth acquisition, then, what it is, and what the cause is of our need of it have been spoken about, and also the necessary sort, that it is a distinct sort, that it is a natural part of household management, since it is concerned with nourishment, and that it is not unlimited like the other, but has a defining mark.

1.10
Wealth Acquisition, Household Management, Usury

It is also clear what the solution is to the puzzle raised at the start[22] about whether the craft of wealth acquisition belongs to a household manager and a politician, or whether this is not so, but wealth must rather be available to him. For just as politics does not make human beings, but takes them from nature and uses them, so too nature must provide land or sea or something else as a source of nourishment, so a household manager must manage what comes from these sources in the appropriate way. For it does not belong to weaving to make wool but to use it, and to know which sorts are usable and suitable or bad and unsuitable.

For someone might be puzzled as to why the craft of wealth acquisition is a part of household management, while the craft of medicine is not, and yet the members of a household need to be healthy, just as they need to live and have every other necessity. But since there is a way in which it does belong to a household manager and a ruler to see even to health, while in another way it does not belong to them, but rather to a doctor, so too in the case of wealth there is a way in which it belongs to a household manager to see to it, and another in which it does not belong to him but to an assistant craft. But above all, as was said previously,[23] nature must ensure that this is on hand. For it is a work of nature to provide nourishment for what is born; for the leftovers of what they are born from are nourishment for each one. That is why in all cases the craft of acquiring wealth from crops and animals is in accord with nature.

But since it is of two sorts, as we said,[24] one belonging to the craft of commerce and the other to household management, and the latter is necessary and praiseworthy, while the craft of exchange is justly blamed (for it is not in accord with nature but involves taking from each other), usury is most reasonably hated, because it gets wealth from money itself, rather than precisely what money was provided for. For money was introduced for the sake of exchange, while interest makes money itself grow bigger. That in fact is how it got its name; for offspring (*tokos*) resemble their parents, and interest (*tokos*) is money that comes from money. And so of all the sorts of wealth acquisition this one is the most against nature.

1.11
Practical Aspects of Wealth Acquisition; Monopolies

Since we have adequately determined[25] what relates to knowledge, what relates to use must be gone through. And of all things of this sort theoretical investigation is

22. 1256a3–10.
23. 1258a20–21.
24. 1256b26–39, 1257b17–23.
25. 1253b14–18.

something free, while experience is something necessary. The practically useful parts of the craft of wealth acquisition are: Being experienced with livestock—for example, with what sorts of horses, cattle, sheep, and similarly other animals yield the most profit in which places and in which ways (for one needs experience of which of these, in comparison to each other, are the most profitable breeds, and which sorts in which places; for one thrives in one place, another in another). Next, being experienced in farming, which is now divided into land planted with fruit and land planted with cereals, and being experienced in beekeeping and in the rearing of the other creatures, whether fish or fowl, from which it is possible to derive benefit. Of the craft of wealth acquisition of the most proper and primary sort, then, these are the parts.

The most important part of the craft of exchange, on the other hand, is trading, which has three parts: ship owning, transport, and marketing. These differ from each other in that some are safer, others offering greater profit. The second part is moneylending; the third is wage-earning, of which one sort involves the unrefined craftsmen, while the other involves those who have no craft knowledge and are useful with their bodies only.

A third form of craft of wealth acquisition comes between this one and the primary one; for it contains some part of the natural one and some part of the craft of exchange. It is concerned with things that come from the earth, or are extracted from the earth, that are inedible but useful—for example, logging and every sort of mining. And this now includes many kinds; for many forms of things are mined from the earth.

Each of these has now been spoken about in universal terms. And, while an exact accounting of each particular one might be useful for putting them into practice, it would be unrefined to spend one's time on it. The most craft-like of these practices are those in which there is the least luck involved; the most unrefined, those in which the body is most damaged; the most slavish, those in which the body is used the most; the most ill-bred, those least in need of virtue in addition.

But since some people have written on these issues—for example, Chares of Paros and Apollodorus of Lemnos on how to farm both grain and fruit, and others on similar issues—anyone who cares to can get a theoretical grasp on them from these. Still, the scattered things that are said about how people have succeeded in acquiring wealth should be collected. For all of them are beneficial for those who hold the craft of wealth acquisition in esteem—for example, the one about Thales of Miletus. This involved an insight related to the craft of wealth acquisition, which, though attributed to him because of his wisdom, happens to be universally applicable. People were reproaching him, indeed, because of his poverty, claiming that his philosophy was of no benefit. And the story goes that he apprehended from his astronomy that a good olive harvest was coming. So, while it was still winter, he raised a little money and put a deposit on all the olive presses in Miletus and Chios, hiring them at a low rate, because no one was bidding against him. When the olive season came and many people all of a sudden sought olive presses at the same time, he hired them out at

whatever rate he chose. He collected a lot of money, proving that philosophers could easily become rich if they wished, but that this is not what they take seriously.

Thales, then, is said to have demonstrated his own wisdom in this way. But, as we said, this sort of insight related to the craft of wealth acquisition—establishing a monopoly for oneself if one can—is universally applicable. That is why some cities also raise revenue in this way when they are in need of resources; for they create a monopoly on goods for sale. And there was a man in Sicily, who used some money that had been deposited with him to buy up all the iron from the foundries, and later, when the merchants came from their warehouses to buy iron, he was the only seller. He did not increase his prices very much, but all the same he added a hundred talents to his original fifty. When Dionysius[26] heard about this, he told the man to take his money, but on the condition that he remain in Syracuse no longer, as he had discovered ways of making money that were harmful to Dionysius' own affairs. Yet this man's insight was the same as Thales'; for each contrived to develop a monopoly for himself.

It is also useful for politicians to know about these things. For many cities need the craft of wealth acquisition and revenues of this sort just as households do, but more so. That is why indeed some people active in politics restrict their political activities to these matters alone.

1.12
The Rule of Women and Children

Since, as we saw, there are three parts to household management, one being mastership (which was spoken about previously[27]), another the science of fatherhood, and a third, marital science, [let us now speak about the other two]; for a wife and children are both ruled as free people, but not with the same mode of rule; instead, a wife is ruled in a political way, children in a kingly one; for a male, unless he is somehow composed contrary to nature, is by nature more capable of leading than a female, and someone older and complete more than someone younger and incomplete.

In most cases of political rule people take turns at ruling and being ruled, because they tend to be equal by nature and to differ in nothing. All the same, whenever one person is ruling and another being ruled, the one ruling tries to distinguish himself [from the ruled] in dress, titles, and honors from the ruled—as, for example, in what Amasis said about his footbath.[28] Male, by contrast, is always related to female in this way.

26. Probably Dionysius I.

27. 1.7.

28. When Amasis (596–525 BC) first became king of the Egyptians, they treated him with contempt because he was of humble origins. So he had a gold footbath made into a statue of a god. The Egyptians treated the statue with great respect. Amasis pointed out that he was like the footbath. He had once been an ordinary person, but he was now a king, worthy of honor and respect. See Herodotus 2.172.

The rule over the children, on the other hand, is kingly; for a begetter rules on the basis both of affection and age, and this is precisely a form of kingly rule. That is why Homer spoke well when he addressed Zeus, who is king of them all, as "Father of gods and men."[29] For a king should be superior by nature, but belong to the same kind, which is precisely the condition of older in relation to younger, and begetter to child.

1.13
The Virtues of Men, Women, Children, and Slaves

It is evident, therefore, that household management is more seriously concerned with human beings than with inanimate property, with their virtue more than with the virtue (which we call "wealth") of acquisition, and with the virtue of free people more than with that of slaves.

The first puzzle to raise about slaves is whether the slave has some other virtue, beyond those he has as an instrument or servant, that is more estimable, such as temperance, courage, justice, and other states of character of this sort, or whether he has none beyond those having to do with the bodily assistance he provides. For there is a puzzle either way; for if slaves do have these other virtues, in what respect will they differ from free? If they do not, it is strange, since slaves are human beings and have a share in reason. Pretty much the same question arises concerning woman and child, as to whether there are virtues proper to them too—whether a woman must be temperate, courageous, and just or not, and whether there are temperate and intemperate children or not.

This question, then, about what is ruled by nature and what is ruling by nature must be investigated in universal terms, as to whether their virtue is the same or distinct. For if both of them must share in noble-goodness,[30] why should one of them rule and the other be ruled once and for all? (For it cannot be that the difference between them is one of more or less; for being ruled and ruling differ in form, not in the more and less.) On the other hand, if the one must share in virtue, while the other must not, that would be a wonder. For if the ruler is not going to be temperate and just, how will he rule well? And if the ruled is not going to be, how will he be ruled well? For if he is intemperate and cowardly, he will do none of his duties. It is evident, **1260ª1** therefore, that both must share in virtue, though there must be differences in it, just as there are in those who are by nature ruled.[31]

Consideration of the soul leads at once to this view; for in it there is by nature a part that rules and a part that is ruled, and the virtue of each, we say, is distinct, that of the part that has reason and that of the non-rational part. It is clear, therefore, that

29. E.g., *Iliad* 1.544.
30. *EE* 1249ª16–17.
31. Reading ἀρχομένων.

the same holds in the other cases as well, so that most instances of ruling and being ruled are by nature of this sort. For free rule slaves, male rules female, and a grown man rules a child in different ways, because, while the parts of the soul are present in all these people, they are present in different ways. For a slave does not have the deliberative part at all; the female has it but it lacks control; a child has it but it is incomplete.

It is to be supposed, therefore, that the same necessarily also holds concerning the virtues of character, that all must share in them, but not in the same way—instead, each must have a sufficient share for their own work. That is why a ruler needs to have complete virtue of character (for a work is unconditionally that of the architectonic craftsman, and reason is an architectonic craftsman), while each of the others must have as much virtue as pertains to them. So it is evident that all those mentioned have virtue of character, and that the temperance of a man is not the same as that of a woman, and neither is the courage or justice, as Socrates supposed,[32] but rather men have the courage of a ruler and women the courage of an assistant, and the same holds of the other virtues.

This will also be clear if we instead investigate each particular one; for people who speak in universal terms are deceiving themselves when they say that virtue is good condition of the soul, or correct action, or something of that sort; for it is far better to enumerate the virtues, as Gorgias does,[33] than to define them in this way. That is why the way the poet spoke about woman is the way one must think about every case. He said, "To a woman silence is a crowning glory"[34]—while to a man this does not apply. Since a child is incomplete, it is clear that his virtue too is not his in relation to himself, but in relation to his end and his leader. And the same holds of a slave in relation to his master. But we laid it down that a slave is useful in relation to the necessities, so of [ethical] virtue too he clearly needs only a little—just so much as will prevent him from being deficient in his works because of intemperance or cowardice.

If what has now been said is true, however, one might raise a puzzle as to whether craftsmen too need to have virtue; for shortcomings often occur in their works because of intemperance. Or is this case very different? For a slave shares in his master's living, while a craftsman is at a greater remove, and virtue pertains to him just to the extent that slavery does; for an unrefined craftsman has a sort of limited slavery. **1260b1** Moreover, a slave is among the things that exist by nature, while no shoemaker is, nor any other sort of craftsman. It is evident, therefore, that the cause of such virtue in a slave must be the master, not the one who possesses the science of teaching him his [various] works. That is why those people[35] do not speak correctly who withhold

32. Plato, *Meno* 73a–c.
33. Plato, *Meno* 71d–72a.
34. Sophocles, *Ajax* 293.
35. E.g., Plato, *Laws* 777e–778a1.

reason from slaves, but tell us to make use only of prescriptive commands; for slaves should be warned more than children.

As regards these matters, let them be determined in this way. As for man and woman, father and children, the virtue relevant to each of them, their relationships with each other, what is good and what is not good in these, and how to achieve the good and avoid the bad—it will be necessary to go through all these in connection with the constitutions. For since every household is part of a city, and these are parts of a household, and the virtue of the part must look to the virtue of the whole, it is necessary to look to the constitution in educating both women and children, if indeed it makes any difference to the excellence of a city that its children be excellent,[36] and its women too. And it must make a difference; for the women are half of the free population, and from children come those who share in the constitution.

So, since these matters have been determined, and the rest must be spoken about elsewhere, let us put aside the present accounts as complete and make a new beginning to our discussion. And let us first investigate those who have expressed views about the best constitution.

BOOK 2

2.1
Constitutions Proposed by Others

Since our deliberately chosen project is to get a theoretical grasp on which sort of political community is superior to all others for people who are able to live as far as possible in the way they would pray to live, other constitutions must be investigated too, both some of those used in cities that are said to be in good legislative order, as well as any others that happen to have been spoken about by anyone and that seem to be in good condition, in order that what is correct and useful in them may be seen, and further, that to seek something distinct beyond them not seem wholly to belong to those who wish to play the sophist; instead, we would have it seem that it is because the presently existing constitutions are not in fact in good condition that the methodical inquiry is undertaken.

One must make a start, however, at what is just the natural starting-point of this sort of investigation. For all the citizens must share either everything, or nothing, or some things but not others. It is evident that it is impossible for them to share nothing (for a constitution is a sort of community, and so they must, in the first place, share their location; for the location of one single city is a single one, and citizens are

36. Reading τοὺς παῖδας εἶναι σπουδαίους.

1261ª1 sharers of that one single city). But of the things that it is possible to share, is it better for all of them to be shared in a city that is to be well managed, or is it better for some of them to be shared but not others? For the citizens could share children, women, and property with each other, as in Plato's *Republic*.[37] For Socrates claims there that children, women, and property should be held communally. Is the present practice better, then, or one that is in accord with the law described in the *Republic*?

2.2
The Constitution of the Republic*: Unity*

For the women to be common to all involves many other difficulties, and this one especially, that what causes Socrates to say that things must be legislated in this way is manifestly not what follows from his arguments. Further, the end he says his city should have is impossible, as in fact stated, yet nothing has been determined about how one should define it. I mean about its being best for a city to be as far as possible entirely one; for this is the hypothesis Socrates adopts.[38] And yet it is evident that a city that advances [toward unity] and becomes more and more one will not be a city at all; for a city is in its nature a sort of multitude, and as it becomes more one, it will turn from a city into a household, and from a household into a human being; for we would say that a household is more one than a city, and an individual than a household. So even if someone could achieve this, it must not be done; for it will destroy the city.

A city consists not only of a larger number of human beings, but also of human beings of different forms. For a city does not come about from those who are alike. For a city is different from a military alliance; for a military alliance is useful because of the weight of numbers, even if they are all of the same form; for an alliance naturally exists for the sake of providing assistance in the way that a heavier weight does when placed on a scale. A nation will also differ from a city in this sort of way, when the multitude is not separated into villages, but is like the Arcadians. But things from which one thing must come about differ in form.

That is why reciprocal equality preserves cities, as was said previously in the *Ethics*,[39] since this is also what must exist among people who are free and equal; for they cannot all rule at the same time, but each can rule for a year or in accord with some other time scheme. In this way, then, the result is that they all rule, just as if shoemakers and carpenters were to exchange places rather than the same people always being shoemakers or carpenters. But since it is better to have it this way also in the case of a political community, it is clearly better, where possible, for the same people always to rule. But among those where it is not possible, because all are in nature equal, it is

37. 423e–424a, 449a–466d.
38. *Republic* 462a.
39. *NE* 1132ᵇ31–1133ª31.

at the same time also just for all to share in ruling (regardless of whether it is good or bad to rule), and for those who are equal to take turns, and to be similar when they are out of office, imitates this;[40] for they rule and are ruled in turn, just as if they had become other people. It is the same way among those who are ruling, some hold one office, some another. **1261ᵇ1** 5

It is evident from these considerations, therefore, that a city is not in nature one in the way some people say it is, and that what is said[41] to be the greatest good for cities destroys the cities. And yet what is good for a given thing in fact preserves it. It is also evident in another way that to seek to produce too much unity in a city is not a better thing. For a household is more self-sufficient than an individual, and a city than a household, and a city tends to come into being at the time when the community of its multitude is self-sufficient. If, then, what is more self-sufficient is indeed more choiceworthy, to be less one is more choiceworthy than to be more one. 10 15

2.3
The Constitution of the Republic*: Women and Children (1)*

But then even if this is best for a community, to be as far as possible one, this does not seem to have been proved by the argument that all at the same time say "mine" and "not mine"[42] (for Socrates takes this as a sign that his city is completely one). For "all" is ambiguous. If it means "each individually," perhaps what Socrates wants will more come about; for each will call the same person his "son," the same woman his "wife," the same things his "property," and so on, then, for each of the things that fall to him. As things stand, however, this is not how those who treat women and children as common will speak. Instead, though all [will say "mine" and "not mine"], they will not do so each individually, and similarly for property too—all, but not each of them individually. Therefore, it is evident that a sort of fallacy is involved in "all say"; for "all," "both," "odd," and "even" are ambiguous, and produce contentious deductions even in arguments.[43] That is why in one way it would be noble if all said the same, although this is not possible, while in another way it is not at all productive of harmony. 20 25 30

In addition to this, what is said [by Socrates] is also harmful in another way. For what is held communally by the most people gets the least care; for people give most thought to what is their own, less to what is communal, or only as much as falls to each of them to give; for apart from anything else, the supposition that someone else is attending to it makes them neglect it more, just as, in the case of household services, many servants sometimes give worse service than few. Each of the citizens 35

40. Reading τοῦτο δὲ μιμεῖται.
41. *Republic* 608e.
42. *Republic* 462a–e.
43. I.e., even, as in logic or dialectic where the focus is on arguments themselves.

acquires a thousand sons, although not as an individual, but rather any random one is likewise the son of any random citizen. So all will be likewise neglected by them all.

1262a1 Further, each says "mine" of anyone among the citizens who is doing well or badly, and says "mine" in this sense, that he is whatever fraction he happens to be of a certain number. What he really means is "mine or so-and-so's," referring in this way to each of the thousand or however many compose the city, and even then he is in doubt; for it is not clear who has had a child born to him, or whether any that were born survived. And yet is this way of calling the same thing "mine" as practiced by each of two or ten thousand people really better than the way they say "mine" in cities as things stand? For the same person is called "my son" by one person, "my brother" by another, "my cousin" by a third, or something else in virtue of some other sort of kinship, whether of blood or connection by marriage—his own marriage, in the first instance, or that of his relatives. Still others call him "my fellow clansman" or "my fellow tribesman." For it is better to have a cousin of one's own than a son in that [Socratic] way.

Nonetheless, it is not even possible to prevent people from having some suspicions about who their own brothers, sons, fathers, and mothers are; for the resemblances that occur between parents and children will necessarily be taken as a demonstration of this. And this is precisely what actually happens, according to the reports of some of those who write accounts of their world travels;[44] for they say that some of the inhabitants of upper Libya hold their women communally, and yet distinguish the children they bear by resemblances. And there are some women, as well as some females of other animals, such as mares and cows, that have a strong natural tendency to produce offspring resembling their sires, like the mare in Pharsalus called "the Just."[45]

2.4
The Constitution of the Republic*: Women and Children (2)*

Further, there are also other difficulties of this sort that are not easy for those establishing this sort of community to avoid, such as assaults, voluntary or involuntary homicides, or verbal abuse. None of these is pious when committed against fathers, mothers, or not too distant relatives (just as none is so even[46] against outsiders). But they will necessarily occur even more frequently among those who do not know their relatives than among those who do—and when they do occur, the latter can perform the customary expiations, while the former cannot.

It is also strange that while making sons communal, he forbids only sexual intercourse between lovers, but does not prohibit sexual love itself or the other practices

44. *HA* 586a13–14.
45. *HA* 586a13.
46. Reading καὶ.

which, between father and son or a pair of brothers, are most unseemly, since even the love alone is so. It is also strange that Socrates forbids sexual intercourse of this sort not due to any other causes but solely because the pleasure that comes from it is so strong, but thinks that the lovers being father and son or brother and brother makes no difference.[47]

It would seem more useful to have the farmers rather than the guardians share their women and children; for there will be less friendship where women and children are held communally. But, with a view to obedience and preventing rebellion, it is the ruled who should be like that. **1262b1**

In general, the effects of such a law as this must of necessity be the contrary of those that correctly laid down laws should be causes of, and the contrary of what led Socrates to think that matters concerning children and women should be ordered in this way. For we think friendship to be the greatest of goods for cities (for in this way people are least likely to engage in faction). And Socrates most of all praises a city's being one—something that seems to be, and that he himself claims to be, the work of friendship. Similarly, in the accounts of love,[48] we know that Aristophanes says that lovers, because of their intense friendship, have an appetite to grow together and from being two become one. The result in such circumstances, however, is that one or both have necessarily perished. And in a city friendship necessarily becomes watery through this sort of community, and the fact that a father hardly ever says "mine" of a son, or son of a father. For just as adding a lot of water to a drop of sweet wine makes the mixture imperceptible, so the same happens here with the kinship connections expressed in these names, it being hardly ever necessary in a constitution of this sort for a father to take care of his sons as sons, or a son his father as a father, or brothers each other as brothers. For there are two things above all that make human beings care and feel friendship, what is special [to them] and what is beloved—neither of which can exist among people under a constitution of this sort.

But then about the transference of the children, once born, from the farmers and craftsmen to the guardians, and vice versa, there is also much confusion about the way it will be done—that is, those who do the transferring and receiving must know who has been transferred to whom.

Further, in these cases what was mentioned previously—I mean assaults, love affairs, and homicides—must of necessity happen even more often; for those who have been transferred to the other citizens will no longer call the guardians "brothers," "children," "fathers," or "mothers," nor will those who have been transferred to the guardians use these terms of the other citizens, so as to avoid, through kinship, committing any offenses of this sort.

About the community of children and women, then, let this be the way our determinations are made.

47. *Republic* 403a–c.
48. Plato, *Symposium* 192c–193a.

2.5
The Constitution of the Republic*: Property*

The next issue to investigate is property, and the way those who are going to be governed by the best constitution should establish it, and whether property is to be held communally or not. One could investigate these questions even separately from the legislative provisions dealing with children and women. I mean whether in matters concerning property, even if children and women are held separately (which is now the way it is everywhere), it still might be best for property at least, or its use, to be communal—for example, the land might be held separately, while the crops grown on it are brought into a communal store to be consumed [communally] (which is precisely what happens in some nations), or, contrariwise, the land might be held communally and farmed communally, while the crops grown on it are divided up for private use (some barbarians are also said to share things in this way), or both land and crops could be communal.

If others worked the land, the way would be different and easier, while if the citizens do the work for themselves, matters concerning property will give rise to much discontent. For if the citizens happen to be unequal rather than equal both in the profits they enjoy and in the work they do, accusations will necessarily be made against those who enjoy or take a lot but do little work by those who take less but do more. In general, indeed, it is difficult to live together and to share in any human concern, above all in ones such as these. This is made clear by the community of travelers away from home; for pretty much the majority of them start quarreling, because they irritate each other in humdrum matters and little things. Further, the servants with whom we get most irritated are those we employ most regularly for day-to-day services.

The communal ownership of property, then, involves these and other similar difficulties. The way that exists now, if adorned by [the relevant] habits and by the order characteristic of correct laws, would be superior, and not by a little. For it would have the good resulting from both (by "from both" I mean both from the property's being communal and from its being private). For while property should in a way be communal, in general it should be private. For dividing up the care of it will produce not mutual accusations, but rather will lead to greater care being given, as each will be attending to his own. But as regards use, it is thanks to virtue that, in accord with the proverb, "the things of friends are common possessions."

Even now this way of arranging things exists in outline in some cities, on the supposition that it is not impossible. In well-managed cities, in particular, some elements of it exist, while others could come about; for although each citizen does have his own private property, he makes available some things to be useful to his friends, and uses some others as if they were communal—for example, in Sparta they use each other's slaves (one might almost say) as their own, and horses and dogs as well, and if they need supplies when on a journey, they may find them in the farms throughout the

territory. It is evident, therefore, that it is better for property to be private, but for its use to be made communal. And to see to it that people become disposed in such a way is the special work of the legislator.

Further, it also makes an untold difference to one's pleasure to regard something as one's own. For it is not perhaps pointless that each self loves himself, but is rather something natural. Self-love is blamed, and justly so. This is not loving oneself, however, but rather loving oneself more than one should, just as in the case of the love of money; for (one might almost say) everyone does love each of the things of this sort. But then too it is very pleasant to assist one's friends, guests, or companions, and do them favors, and this happens when the property is one's own. These things, then, do not take place for those who make the city too much one thing, and in addition it is evident that they do away with the work of two of the virtues, temperance in regard to women (for to keep away from another man's woman due to temperance is noble work) and generosity with one's property (for one cannot show oneself to be generous, nor perform any generous action; for it is in the use made of property that generosity's work lies).

Such legislation looks attractive, then, and may seem to appeal to human feelings; for anyone who hears of it accepts it gladly, thinking that all will have a wondrous friendship for all, especially when someone blames the evils now existing in constitutions on property's not being communal (I mean suits against each other over contracts, perjury trials, and flattery of the rich). Yet none of these bad things comes about because property is not communal but because of depravity, since we see that those who own and share property communally have far more disagreements than those who own their property separately. But in theory we take those who disagree over what they own communally to be few in number, because we compare them to the many whose property is private. Further, it would be just to mention not only how many bad things people will be deprived of by sharing, but also how many good things. Their life, though, appears altogether impossible.

The cause of Socrates going astray one must consider to be the incorrectness of his assumption. For a household and a city should indeed be in a way one, but not in every way. For as a city proceeds in this direction, there is a point at which it will in one way cease to be a city and at which, in another way, while it will still be a city, as it comes closer to not being a city, it will be a worse city. It is as if one were to reduce a harmony to a unison, or a rhythm to a single beat. But because a city is a multitude, as was said previously,[49] it must be unified and made into a community through education. And it is strange that the one who intends to introduce education, and who believes that through it the city would be excellent, should think to rectify it by measures of this sort, and not by habits, philosophy, and laws, just as in Sparta and Crete the legislator made property communal by means of communal messes.

49. 1261[a]18.

1264a1 And one must not ignore this point either, that one must pay attention to the long period of time and the many years during which it would not have gone unnoticed if these measures were any good; for pretty much everything has been discovered, although some things have not been collected, and others, though known, are not used. The matter would become especially evident, however, if one could see by the facts a constitution established in this way; for it is impossible to produce a city without separating the parts and dividing [them], some into communal messes, others into clans and tribes.

So nothing else will result from the legislation except that the guardians will not farm—which is precisely what the Spartans are trying to do even as things stand.

Neither, for that matter, has Socrates said what mode of the constitution as a whole applies to those who share in it, nor is it easy to say. And yet the multitude of the other citizens is pretty much the entire multitude of his city, but nothing has been determined about whether the farmers too should have communal property or each his own private property, or, further, whether both their women and their children should be private or communal.

If, in fact, all is to be held communally by all in the same way, how will these farmers differ from the guardians? And what more will they get by submitting to their rule? Or what will they learn to make them submit to it—unless the guardians adopt some clever stratagem like that of the Cretans? For they allow their slaves to have the same other things as themselves, forbidding them only the gymnasia and the possession of weapons.

On the other hand, if the farmers too are to have things of this sort, as they do in other cities, what way will their community be ordered? For of necessity there will be two cities in one, and those opposed to each other. For Socrates makes[50] the guardians into a sort of garrison, while he makes citizens of the farmers, craftsmen, and the others. Accusations, suits, and such other bad things as he says exist in other cities will all then exist among them too. And yet Socrates claims that because of their education they will not need many regulations (for example, city or market ordinances, or others of that sort), though he gives this education only to the guardians.

Further, he gives the farmers control of their property, although he requires them to pay a tax.[51] But this is likely to make them much more difficult to deal with and full of their own ideas than the helots, serfs, and slaves that some people have today.

But whether the same things are indeed similarly necessary for the farmers or not, has in fact nowhere been discussed—and neither has the related question of what constitution, education, and laws they are to have. It is not easy, either, to discover what sort of people these are, nor is the difference it makes to the preservation of the community of the guardians a small one. But if, at any rate, Socrates is going to make
1264b1 their women communal and their property private, who will manage the household

50. *Republic* 415a–417b, 419a–421c, 543b–c.
51. Rejecting the addition of τοὺς.

in the way the men manage things in the fields? Who will manage it, indeed, if the farmers' women and property are communal? It is also absurd to draw a comparison with wild beasts in order to show that women should engage in the same practices as men; wild beasts have no share in household management.

The way Socrates appoints rulers is also unstable. For he makes the same people rule all the time, which is a cause of faction even among people who have no recognized worth, and all the more so, then, among spirited and warlike men. But it is evident that it is necessary for him to make the same people rulers; for the gold from the god has not been mixed into the souls of one lot of people at one time and another at another, but always into the same ones. He says[52] that the god, immediately at their birth, mixed gold into the souls of some, silver into others, and bronze and iron into those who are going to be craftsmen and farmers.

Further, even though Socrates does away with the happiness of the guardians, he says that the legislator should make the whole city happy. But it is impossible for the whole city to be happy unless all, or most or some, of its parts possess happiness. For happiness is not the same thing as evenness; for it is possible for the latter to be present in the whole without being present in any of the parts, while happiness cannot. But if the guardians are not happy, who else is? Surely not the craftsmen or the multitude of those who are unrefined.

These, then, are the puzzles raised by the constitution Socrates describes, and there are others that are not inferior to these.

2.6
The Constitution of the Laws

Pretty much the same holds in the case of the *Laws*, which was written later; that is why it is better that the constitution there be also briefly examined. For in fact in the *Republic* Socrates[53] has determined altogether few things: how things should stand concerning the community in women and children, concerning property, and concerning the order characteristic of the constitution; for the multitude of the inhabitants is divided into two parts: the farmers and the part that goes to war for it, and from the latter comes a third, the deliberative and controlling element in the city. But about whether the farmers and craftsmen will share in ruling to some extent or not at all, and whether or not they too are to possess weapons and join in battle—about these matters Socrates has determined nothing. He does think, though, that the women should join in battle and receive the same education as the guardians. Otherwise, he has filled out his account with extraneous material, in particular about what sort of education the guardians should receive.

52. *Republic* 415a–c.

53. Socrates is not in fact a character in the *Laws*, but Aristotle includes the dialog among Plato's "Socratic accounts" ($1265^{a}11$).

1265a1 The *Laws* consists for the most part of laws, and he has said little about the constitution. And, although he wishes to make this one more attainable by [actual] cities, he gradually turns it back toward the other. For, with the exception of the community in women and property, the other things he assigns to both constitutions are the same: the same education, living in abstention from the necessary works, and the communal messes in like manner—except that in this constitution he says that there are to be messes for women too, and that those possessing hoplite weapons should be five thousand, while it is one thousand there.

All the Socratic accounts are extraordinary, sophisticated, innovative, and exhibit a spirit of inquiry, but it is presumably difficult to do everything well. In the case of the multitude just mentioned, for example, one must not overlook the fact that it would need a territory the size of Babylon, or some other unlimitedly large territory, to nourish five thousand in idleness, and another mob of women and servants, many times as great, along with them. One should assume conditions that answer to one's prayers, to be sure, but not ones that are impossible.

It is said[54] that the legislator should look to just two things in setting up his laws: the territory and the human beings. But, further, it would be good to add that he should look to the neighboring places too, if, first of all, the city is to live a political life and not an isolated one; for it must then possess the weapons that are useful for war not only in its own region, but also against the places outside it. If, however, one rejects this sort of life, both for the individual and for the city communally, the need to be fearsome to enemies is just as great, both when they have invaded its territory and when they have left it.

And the quantity of property should also be looked at, to see whether it would not be better to define it differently and in a more perspicuous way. For he says that there should be as much as is needed "to live temperately," which is as if one were to say, "to live well"—for this is too universal. Further, it is possible to live temperately but miserably. A better definition would be "to live temperately and generously" (for, when separated, the one will lead to poverty, the other to luxury), since these are the only choiceworthy states concerned with the use of property—for example, one cannot use property either in a mild-mannered way or in a courageous one, but one can do so temperately and generously. So the states concerned with its use must also be these.

Also, it is absurd that while property is equalized nothing is established concerning the number of citizens, but instead the production of children is allowed to be unlimited, on the supposition that it will remain sufficiently close to the same number, due to childlessness, no matter how many births there are, because this seems to
1265b1 be what happens in present-day cities. But the exactness this requires is not the same there as in cities nowadays; for nowadays, no one is left without resources because properties are divided among however great a number there happens to be. But in

54. Not in the extant *Laws*. Aristotle may be inferring it from 704a–708d, 747d, 842c–e.

that city properties are indivisible, so that excess children will necessarily get nothing, no matter whether they are fewer or greater in number. One might well take it that it is the production of children that should be restricted, rather than property, so that no more than a certain number would be born, and that this number should be fixed by looking to the chances of some of those who are born dying, and of childlessness on the part of others. To leave the number unrestricted, as is done in most cities, necessarily causes poverty among the citizens; and poverty produces faction and crime in the city. In fact, Pheidon of Corinth,[55] one of the most ancient legislators, thought that the households and the number of citizens should be kept equal, even if the allotments of land everyone had were of unequal size to begin with, while in the *Laws*, it is just the contrary. But these matters, and how we think these matters could be better handled, must be spoken about later on.[56]

Also omitted in these *Laws* are matters concerning the rulers and how they will differ from the ruled. For he says[57] that just as warp and woof come from different sorts of wool, so should the rulers stand in relation to the ruled. And since he permits[58] someone's total property to increase up to five times its original value, why should this not also hold of land up to a certain point? Also, the division of homesteads needs to be investigated, in case it is disadvantageous to household management; for to each individual he assigned[59] two homesteads, dividing them and making them separate, but it is difficult to manage two households.

The whole order is intended to be neither a democracy nor an oligarchy but a mean between them. It is called a "polity"; for it is made up of those with hoplite weapons. If he is establishing this, in comparison with [all] other constitutions, as the most attainable by other [actual] cities,[60] what he has said is perhaps correct, but if as next best after the first constitution, it is not correct. For one might well give more praise to the Spartan constitution, or some other more aristocratic one. Some say, indeed, that the best constitution must be a mixture of all constitutions, which is why they praise the Spartan one (for some assert that it is made up of oligarchy, monarchy, and democracy, saying that the kingship is a monarchy, the office of senators an oligarchy, and that it is governed democratically in virtue of the office of the overseers, because the overseers come from the people, while others say that the overseership is a tyranny, and that the democratic governing lies in the communal messes and the rest of daily life). But in these *Laws* it is said that the best constitution **1266ª1** should be composed of democracy and tyranny[61]—constitutions one might well take

55. Otherwise unknown.
56. 7.5, 7.10, 7.16.
57. *Laws* 734e–735a.
58. *Laws* 744e.
59. *Laws* 745c–e, 775e–776b.
60. I.e., as more attainable ($1265^{a}1$) than all other constitutions, and so most attainable.
61. Actually, monarchy and democracy (756e).

as not constitutions at all, or as the worst of all. They speak better, then, who mix together a larger number; for the constitution composed of a larger number is better.

Next, the constitution in the *Laws* manifestly has no monarchical element at all, but [only] oligarchic and democratic ones, with a tendency to lean more toward oligarchy. This is clear from the appointment of officials; for while choosing by lot from a previously elected pool is common to both, to require richer people to attend the assembly and to vote for officials, or to do some other political task, without requiring these things of the others, is oligarchic. The same is true of the attempt to make the majority of officials come from among the rich, with the most important ones coming from among those with the highest property assessment.

He also makes the election of the council oligarchic.[62] For everyone is required to elect candidates from the first property assessment class, then again in the same way[63] from the second, then from the third—except that not everyone is required to elect candidates from the third or the fourth, and only members of the first and second are required to elect candidates[64] from the fourth. Then from these, he says, an equal number must be designated from each assessment class. More of them, then, will come from the highest assessment classes and the better sort, because some of the people will not vote because they are not required to.

It is evident from these considerations, then, and from what will be said later on,[65] when our investigation turns to this sort of constitution, that a constitution of this sort should not be composed of democracy and monarchy. But in fact as regards the election of officials, electing from the elected is dangerous. For if some are willing to combine, even if they are a relatively small number, the elections will always turn out according to their wish.

This, then, is the way matters stand concerning the constitution in the *Laws*.

2.7
The Constitution of Phaleas of Chalcedon

There are also certain other constitutions, proposed either by private individuals or by philosophers and politicians, but all of them are closer to the established constitutions, by which people are governed as things stand, than either of the ones just discussed. For no one else has ever suggested the innovations of sharing children and women, or of communal messes for women. Instead, they start with the necessities. For to some of them it seems that the most important thing is to have matters concerning property ordered in a good way; for they say that it is over these matters that everyone creates factions.

62. 756b–e.
63. Reading ἴσως.
64. Reading τοὺς.
65. 4.7–9, 1296[b]34–1297[a]13.

That is why Phaleas of Chalcedon, the first to propose a constitution of this sort, did so; for he says that the property of the citizens should be equal. He thought that this was not difficult to produce when cities were just being settled, that in those already settled it would be more difficult, but that nonetheless a leveling could be very quickly achieved by the rich giving but not receiving dowries, and the poor receiving but not giving them.

Plato, when writing the *Laws*, thought that up to a certain point things should be left alone, but that no citizen should be permitted to have a property more than five times the size of the smallest, as was also said previously.[66] But people who legislate in this way must not forget, as they now do, that, while regulating the quantity of property, they should also regulate the quantity of children; for if the number of children exceeds the size of the property, it is necessary for the law to be abrogated at least. But abrogation aside, it is a bad thing for many people to become poor after having been rich; for it takes work for [the city not to allow] people of this sort to become revolutionaries.

That is why the leveling of property does indeed have some influence on political communities. This was manifestly recognized even by some in ancient times—for example, both in the legislation of Solon[67] and in the law in force elsewhere that prohibits anyone from getting as much land as he might wish. Laws likewise prevent the sale of [landed] property, as among the Locrians, where the law forbids it unless an evident misfortune can be shown to have occurred. In yet other cases it is required that the original allotments be preserved. It was the abrogation of this provision at Leucas that made their constitution democratic too; for, as a result, offices were no longer filled from the designated assessment classes. But equality of property may exist and yet the amount may be too great, so that it leads to luxury, or too low, so that it leads to living in a penurious way.

It is clear, then, that it is not sufficient for the legislator to make property equal: he must also aim at the mean. Further, even if one were to arrange a moderate property for everyone, it would be no benefit; for one should rather level appetites than property, and that cannot happen unless people have been sufficiently educated by the laws.

But perhaps Phaleas would reply that this is actually what he was saying; for he thinks that cities should have equality in these two things: property and education. But one must also say what the education is going to be, and to have it be one and the same is no benefit; for it can be the same and one, but the sort from which people will become disposed to deliberately choose to get more wealth or honor or both.

Further, people engage in faction not only because of inequality of property but also because of inequality of honors—although in contrary ways in each case: ordinary people do so because of inequality in property, sophisticated ones because of

66. $1265^{b}21–23$.
67. $1273^{b}35–1274^{a}21$, *Ath*. 5–12.

1267a1 honors, if they are equal. Hence the saying: "Noble and base are held in a single honor."[68]

Human beings, however, do not commit injustice only because of the necessities, which Phaleas thinks equality of property will remedy (in that they will not steal because of cold or hunger), they also commit them to get enjoyment and assuage their appetites; for if they have an appetite for more than the necessities, they will seek to cure it by committing injustice—and not, you may be sure, because of this alone, but rather, even without appetites, they will commit injustice in order to enjoy the pleasures that are without pain. What, then, is the remedy for these three? For the first, moderate property and work to do; for the second, temperance; third, if certain people wish to find enjoyment through themselves, they should not look for a remedy beyond philosophy. For all other pleasures require [other] people. The greatest injustices, at any rate, are committed because of excess and not because of the necessities—for example, no one becomes a tyrant to escape the cold. That is why the honors are great when one kills not a thief but a tyrant. So Phaleas' mode of constitution would be a help only against minor injustices.

Further, he wishes to establish many things thanks to which the citizens will govern well in their relations with each other, while he should also establish things thanks to which they will do so in their relations with neighbors and outsiders as a whole. It is necessary, therefore, for the constitution to be ordered with a view to military strength, about which he has said nothing.

Matters are similar as regards property. There needs to be enough not only for use within the city, but also to meet external dangers. That is why the quantity of it on hand should be neither so great that stronger neighbors will have an appetite for it, and the owners unable to repel the attackers, nor so little that they cannot sustain a war even against those who are equal or similar.

Although Phaleas has determined nothing about this, one should not overlook how much property it is advantageous to have. Perhaps the best defining mark is this: that those [neighbors] who are stronger will not profit if they go to war because of the [city's] excess in property, but as they would if the property were not so great. For example, when Autophradates was about to lay siege to Atarneus, Eubulus told him to consider how long it would take to capture the place, and then to calculate what such time would cost; for he said he was willing to abandon Atarneus at once for less. These words made Autophradates have second thoughts and stop the siege.

So, while equalizing the property of citizens is among the things that are advantageous with a view to their not engaging in faction against each other, it is (one might almost say) no big thing. For in fact sophisticated people would get vexed, on the grounds that they deserve not to be equal, which is why indeed they are often seen being on the attack and engaging in faction. Further, the wickedness of people is an
1267b1 insatiable thing, and a mere two obols is enough at first, but once that has become

68. Homer, *Iliad* 9.319.

traditional, they always ask for more, and go on doing so without limit. For it is the nature of appetite to have no limit, and satisfying it is what ordinary people live for. The starting-point in matters of this sort, then, rather than leveling property, is to establish things so that while those who are by nature decent are of such a sort that they do not wish to get more, the base ones cannot do so—which will be the case if they are weaker and not treated unjustly.

But even about the equalizing of property Phaleas has not spoken correctly. For he equalizes only landed property, but wealth also exists in slaves, livestock, and money, and there is a great supply of it in so-called movables. So either equality—or some moderate regulation—should be sought in all these or all should be left alone.

It is also evident from his legislation that the city he is establishing is a small one—if, at any rate, all the craftsmen are to be public slaves and are not to contribute to the full membership of the city. But if indeed those engaged in doing public works should be public slaves, it should be in this way, just as it was in Epidamnus and as Diophantus tried to establish in Athens.

Concerning the constitution of Phaleas, then, one should, on the basis of these considerations, be pretty much able to get a theoretical grasp on whether he spoke correctly on some issue or incorrectly.

2.8
The Constitution of Hippodamus of Miletus

Hippodamus of Miletus, the son of Euryphon, was the man who invented the division of cities and laid out the street plan for Piraeus. (He was extraordinary in other aspects of his life as well, because of his love of honor, so that he seemed to some people to be overly affected, with his long hair, expensive jewelry, and with the same cheap warm clothing besides, worn not only in winter but also in summer, and his wish too to be considered well-versed about nature as a whole.) He was the first of those not engaged in politics who attempted to say something about the best constitution.

The city he wanted to establish had a multitude of ten thousand citizens, divided into three parts; for he made one part the craftsmen, one the farmers, and a third to go to war for the city and possess weapons. And he wanted to divide the territory into three parts—one sacred, one public, and one private. That from which what is customarily rendered to the gods was produced would be sacred; that from which the ones who go to war for it would live, public; and the land belonging to the farmers, private.

He thought that there were just three forms of laws; for the things about which suits arise are three in number—wanton aggression, harm, and death. He also wanted to legislate a single court with [complete] control, to which all suits thought not to have been well judged were to be referred, which he proposed to establish from

1268a1 a certain number of elected elders. Court judgments should not be rendered, he thought, by casting ballots, but rather each judge should deposit a tablet: if he simply convicts, he should write the penalty on it; if he simply acquits, he should leave it blank; if he convicts to some extent and acquits to some extent, he should make the relevant distinctions. For he thought that as things stand legislation is not well drafted; for it compels judges to violate their oath[69] by judging one way or the other.

Further, he set up a law that those who discover something advantageous to the city should be honored, and that children of those who die in war should receive support from public funds, on the supposition that this had not been legislated elsewhere, while a law of this sort actually exists both in Athens and in some other cities. The officials were all to be elected by the people, and the people to be made up of the city's three parts. Those elected were to supervise communal matters, matters relating to aliens, and matters relating to orphans.

These, then, are most of the features of Hippodamus' order, and the ones that are most worth discussing. And the first puzzle to raise would be with the division of the multitude of citizens. For the craftsmen, the farmers, and those who possess weapons all share in the constitution. But the fact that the farmers do not possess weapons, and that the craftsmen possess neither land nor weapons, makes them both pretty much slaves of those who do possess weapons. So it is impossible that every office be shared; for the generals, civic guards, and all the officials with (one might almost say) the most control will necessarily be appointed from those who possess weapons. But if the farmers and craftsmen do not share in the constitution, how can they possibly have any friendly feelings for the constitution? On the contrary, those who possess weapons have to be stronger than both of the other parts. Yet that is not easy unless they are numerous; and, in that case, is there any need to have the others share in the constitution or control the appointment of officials?

Further, what use are the farmers to the city? Craftsmen are necessary (for every city needs craftsmen), and they can support themselves, just as in other cities, from their craft. The farmers would reasonably have been some part of the city if they provided nourishment for those who possess weapons, while, as things stand, they have private land and farm it privately.

Further, there is the public land, from which the ones who go to war for the city are to get their nourishment. If they are to farm it themselves, the fighting part will not be different from the farming one, as the legislator wishes them to be. And if there are going to be some others to do so, different from those who farm privately and from the warriors, this will be a fourth part again in the city, which shares in nothing and is alienated from the constitution. But then if one were to make those who farm the private land and those who farm the public land the same, the quantity 1268b1 of produce from each one's farming will be inadequate for two households. And why

69. *Rh.* 1375a29–30, b16–17.

is it that they will not from the same land and the same allotments at once provide nourishment for themselves and for the soldiers? There is much confusion in all this.

The law about judgments is not good either, requiring judging to consist in making distinctions, while the charge is written in unconditional terms—that is, making a judge into an arbitrator. This is possible in arbitration, even if there are many arbitrators (for they can confer together over their judgment). But it is not possible with courts, and, indeed, most legislators do the contrary and establish things so that the judges do not confer with each other.

In addition, how will the judgment not be confused when a judge thinks the defendant owes something, but not as much as the plaintiff thinks? For if the plaintiff claims twenty minas, but the judge awards ten (or the former more, the latter less), another awards five, and another four, it is clear, then, that they will split the award in this way, while some will convict for the whole sum, and others for nothing. In what way, then, will the votes be counted?

Further, nothing compels a judge who, in a just way, unconditionally acquits or convicts to perjure himself, if indeed the accusation was written in unconditional terms. For one who acquits is not judging that the defendant owes nothing, only that he does not owe the twenty minas. But a judge who convicts, without believing that he owes the twenty minas, violates his oath straightway.

As for his suggestion that those who discover something advantageous to the city should receive some honor, legislation of this sort is not safe, but only pretty to listen to; for it would involve "sycophancy" and might even lead to change in the constitution. But this slides into another problem and another investigation; for some people raise the puzzle of whether it is advantageous or harmful to cities to change their ancestral laws, if some other is better. That is why, if indeed change is not advantageous, it is not easy to give ready assent to what Hippodamus says; it is possible, however, that certain people might propose that the laws or the constitution be dissolved on the supposition that this is for the common good.

Since we have mentioned this issue, however, it is better to expand on it a little. For, as we said, there is a puzzle here and change may seem better. In the other sciences, at any rate, change has certainly proved to be advantageous—for example, medicine has changed from its ancestral ways, as has athletic training, and all the crafts and capacities generally. So, since politics too must be counted as one of these, it is clear that something similar must also hold of it.

A sign of this, one might claim, is provided by the facts themselves; for the laws [or customs] of ancient times were exceedingly simple and barbaric. For example, the Greeks used to both carry weapons and buy women from each other, and the pieces that remain of ancient laws in some places are altogether naive—such as the homicide law in Cyme that if the prosecutor can provide a number of his own relatives as witnesses, the defendant is guilty of murder. **1269^{a}1**

In general, everyone seeks not what is ancestral but what is good. But it is probable that the first ones, whether they were "earth-born" or the survivors of some

cataclysm,[70] were like random people [today] or people who lack understanding (and this in fact is precisely what is said about the earth-born). So it would be absurd to cling to their beliefs.

In addition, it is not better to leave written laws unchanged either. For just as it is in the other crafts, so too in [the science of] political order, it is impossible to write down everything exactly; for it is necessary to write them in universal terms, while actions are concerned with particulars.

From these considerations, then, it is evident that some laws must sometimes be changed. But to those who investigate the matter in another way this would seem to require much caution; for if the improvement is small, and if it is a bad thing to accustom people to casual abrogation of the laws, then some of the legislators' or rulers' errors must manifestly be left unchanged; for the benefit resulting from the change will not be as great as the harm of being made accustomed to disobey the rulers.

On the other hand, the paradigm involving the crafts is false; for changing a craft is not like changing a law; for the law has no strength to secure obedience except habit, and habit does not develop except over a long period of time. So to change easily from existing laws to new and different ones is to weaken the capacity of law itself.

Further, if laws are indeed to be changed, are they all to be changed, and in every constitution, or not? And by any random person, or by certain ones? For these things make a big difference. Let us therefore set aside this investigation for the present; for it belongs to other occasions.[71]

2.9
The Spartan Constitution

About the Spartan constitution and the Cretan one, and about pretty much all the other constitutions as well, there are two investigations to be made, one whether there is anything legislated in it that is good or not good with a view to the best order, the other whether there is anything legislated in it that is contrary to the hypothesis or to the mode of constitution they actually have.

It is generally agreed that a constitution that means to be governed in a good way must provide leisure from necessary works. But the way to provide this is not easy to grasp. For the Thessalian serfs have often attacked the Thessalians, just as the helots have the Spartans (for they are forever lying in wait, as it were, for bad luck to strike their masters). But nothing like this has so far happened in the case of the Cretans. Perhaps the cause of this is that the neighboring cities, though they war with each other, never ally themselves with the rebels, because it is not to their advantage to do

70. Plato, *Statesman* 272c–d, *Laws* 677b–678b.
71. Not in the extant *Politics*.

so, since they themselves also possess subject peoples. Sparta's neighbors, on the other hand—Argives, Messenians, and Arcadians—were all hostile. The Thessalians too first experienced revolts because they were still at war with their neighbors—Achaeans, Perrhaebeans, and Magnesians. And it would seem, even if nothing else, that the supervision of serfs, at any rate, and what way one should consort with them, is a troublesome matter; for if they are given license, they become wantonly aggressive and claim to be of equal worth to those in control; and, if they live in misery, they conspire and hate. It is clear, then, that those to whom this happens in connection with helotry have not found the best mode of it.

Further, the license of their women is also detrimental both to the deliberate choice of the constitution and to the happiness of the city as well. For just as part of a household is a man and part a woman, it is clear that a city too should be regarded as being divided into two nearly equal parts: the multitude of the men and that of the women. So in all constitutions in which matters relating to women are badly handled, half the population should be regarded as not being regulated by any law. And this is precisely what has happened in Sparta; for the legislator, wishing the whole city to have resilience, makes his wish evident in the case of the men, but has been negligent in the case of the women; for they live free of discipline, giving in to every sort of intemperance, and luxuriously.

The necessary result is that wealth is esteemed in a constitution of this sort, especially if they are actually controlled by the women, as most militaristic and warlike races are (excluding the Celts and some others who openly esteemed sexual relations between males). For the one who first told the myth seems not to have been unreasonable in coupling together Ares and Aphrodite; for all warlike men seem prone to being possessed by a desire for sexual intercourse either with men or women. That is why this happened to the Spartans, and in the days of their [hegemonic] rule, many things were managed by women. And yet what difference is there between women ruling and rulers ruled by women? For the result is the same. Rashness is not useful in day-to-day matters, but only—if indeed at all—in war, and Spartan women have been very harmful even in this respect. This they made clear during the Theban invasion;[72] for they were of no use at all, as women are in other cities, but caused more confusion than the enemy.

From the start, then, it seems that this license with regard to women occurred in Sparta for good reason. For Spartan men spent much time away from home because of their expeditions, that is, when they were at war with the Argives, and again with **1270^{a}1** the Arcadians and Messenians. When leisure returned, they placed themselves in the hands of their legislator, having been already well prepared by the military life; for it includes many of the parts of virtue. As for the women, people say that when Lycurgus tried to bring them under the laws, they resisted and he retreated. These, then, are the causes of what happened—and, it is clear, of the present error as well.

72. 369 BC under Epaminondas.

But we are not investigating the question of whom we should excuse and whom not, but what is correct and what is not correct.

The fact that matters relating to women are not well-handled seems not only to create a certain impropriety in the constitution itself, as was also said previously,[73] but also to contribute something to the love of money. For after the things just stated one might next criticize the uneven distribution of property. For because some of the Spartans came to own far too much wealth and others altogether too little, the land passed into the hands of a few. And this too is badly ordered through the laws; for the legislator quite correctly made it not noble to buy or sell an existing land holding, but he left owners free to give or bequeath their land if they wished, and yet this necessarily leads to the same results as the other. And, indeed, roughly two-fifths of all the land belongs to the women, both because many become heiresses and because large dowries are given. And yet it would have been better if it had been ordered that there be no dowry, or a small or even a moderate one. But, as things stand, a person can give an heiress daughter in marriage to whomever he wishes, and if a man dies intestate, the person he leaves as his heir gives her to whomever he pleases. As a result, in a land capable of supporting fifteen hundred cavalry and thirty thousand hoplites, there were fewer than a thousand. And it became clear because of the facts themselves that the ordering of these things served them badly; for the city did not withstand one single blow, but was ruined because of the shortage of men.[74]

It is said that in the time of their early kings, they used to give a share in the constitution to others, so that at that time there was no shortage of men, despite the fact that they were at war for a long time. Indeed, they say that at one time the Spartiates actually had ten thousand members. But regardless of whether or not this is true, a better way to keep high the number of men in a city is by leveling property. But the law dealing with the production of children is also opposed to this correction. For the
1270b1 legislator, wishing there to be as many Spartiates as possible, encourages the citizens to have as many children as possible. For there is a law exempting a father of three sons from military service, and a father of four from all taxes. And yet it is evident that if many children are born, and the land has been correspondingly divided, many people will necessarily become poor.

But then matters relating to the board of overseers[75] are badly handled too. For this office by itself controls their most important matters, but the overseers are drawn from among the entire people, so that often very poor men enter it, who, because of their poverty, are open to bribery. (This has been made clear on many occasions in the past as well, and in our own day among the Andrians; for some, corrupted by silver, destroyed the entire city, so far as it was up to them.)

73. 1269b17–23.

74. In the battle of Leuctra in 371 BC.

75. Five ephors or overseers were elected annually by the Spartiates. They supervised the operations of the political and judicial system as a whole, and they served to limit the powers of the two kings.

Also, because the office is too powerful—in fact, equal to a tyranny—even the kings were forced to act the part of popular leaders for the overseers. And because of this too the constitution has been harmed; for from an aristocracy a democracy was emerging.

Certainly, the board of overseers does in fact hold the constitution together—for the people remain at peace because they share in the most important office, so that, whether it came about due to the legislator or due to luck, it is advantageous to Spartan affairs; for if a constitution is going to survive, every part of the city itself must wish it to exist and endure.[76] And the kings are in this condition because of the honor given to them; the noble and good, because of the senate (since this office is a reward of virtue); and the people, because of the board of overseers (since appointments to it are made from all). Still, though the overseers should be chosen from all, it should not be in the way it is now[77] (for it is exceedingly childish).

Further, the overseers control the most important judicial decisions, though they are random people. That is why it would be better if they judged cases not on the basis of their own consideration but in accord with the letter of the laws. Also, the overseers' mode of life is not in keeping with what the city wishes; for while it itself is exceedingly lax, among the others it is excessive in its hardness, so that they are incapable of the resilience [it requires] but secretly escape from the law and indulge in the pleasures of the body.

Also, matters relating to the office of the senators[78] also do not serve the Spartans well either. For if the senators were decent people and sufficiently well educated in manly goodness, one might well say that this office is advantageous to the city—and yet one might dispute about whether they should have lifelong control of important matters (for there is old age of thought as there is of the body). But when they are educated in such a way that even the legislator himself distrusts them on the grounds **1271a1** that they are not good men, it is not safe. And it is evident in fact that in many matters of public concern those who have shared in this office have repeatedly taken bribes and shown favoritism. That is why it is better for the senators not to be exempt from being inspected—which at present they are. On the other hand, it might seem that the overseers should inspect every office; but this would give too much to the board of overseers, and is not the way we say that inspections should be carried out.

The election they conduct of the senators is also decided in a childish way,[79] and for the person who is going to be considered worthy of the office to have to ask for it himself is not correct; for the one worthy of the office should hold it whether he wishes to or does not wish to. But as things stand the legislator is manifestly doing just the same here as in the rest of the constitution. He arranges for the citizens to

76. Reading αὐτά.

77. Either by acclamation or by lot.

78. The Spartan senate (*gerousia*) had twenty-eight members in addition to the two kings, all over sixty and probably chosen from aristocratic families.

79. By an elaborate process of acclamation.

love honor and then uses this fact for the election of the senators; for no one would ask for office who did not love honor. And yet of most voluntary acts of injustice among human beings the majority are pretty much caused by the love of honor or by the love of money.

As regards kingship, whether it is better for cities to have one or better not to have one, is a matter for another account.[80] But it is surely better, at any rate, to choose each new king not as now, but rather in accord with his own mode of life. And it is clear that even the [Spartan] legislator himself did not think it possible to make the kings noble and good men; at any rate, he distrusts them, on the grounds that they are not sufficiently good men. That is why the Spartans used to send out a king's opponents as fellow ambassadors, and why they regarded factional conflict between the kings as tantamount to preservation for the city.

Nor were matters concerning the communal messes (or so-called *phiditia*) well legislated by the person who first put them in place. For they should rather be paid for from public funds, as they are in Crete. Among the Spartans, by contrast, each individual has to contribute, even though some are very poor and unable to afford the expense. So the result is the contrary of the legislator's deliberately chosen aim. For he wishes the communal messes to be established as something democratic, but legislated as they are now they are scarcely democratic at all. For the very poor cannot easily participate in them. Yet the defining mark of this constitution, which is ancestral for them, is that those who cannot pay this contribution cannot participate in it.

The law dealing with the admirals has also been criticized by others, and correctly criticized too. For it becomes a cause of faction; for over against the kings, who are permanent generals, the office of admiral has been put in place as pretty much another kingship.

One might also criticize the hypothesis of the legislator in precisely the way Plato criticized it in the *Laws*;[81] for the entire order characteristic of their laws aims at a part of virtue, military virtue; for this is the virtue that is useful for conquest. They were able to preserve themselves, then, while they were at war, but they started to decline once they ruled supreme, because they did not have the scientific knowledge of how to be at leisure and had never undertaken any sort of training with more control than the military sort. And the error involved in this is not small; for they think that the good things that people fight about are won by virtue rather than by vice, and this is correct, but they also think that these goods are better than virtue itself, and this is not correct.

Matters relating to communal funds are also in a bad condition among the Spartiates. For even though they are compelled to fight major wars there is nothing in the communal fund of the city and taxes are not properly paid; for because most of the land belongs to the Spartiates, they do not examine each other's tax payments.

80. 3.14–17.
81. 625c–638b.

And thus the result for the legislator is the contrary of advantageous; for he has made his city poor and the private individuals into lovers of money.

Concerning the Spartan constitution, then, let this much be said; for these are the things one might particularly criticize in it.

2.10
The Cretan Constitution

The Cretan constitution is very close to the Spartan, and while in some small respects it is no worse, most of it is less polished. For it seems in fact—at any rate, it is said—that the Spartan constitution is largely an imitation of the Cretan, and most older things are less fully elaborated than newer ones. For they say that Lycurgus, when he had relinquished the guardianship of King Charilaus and gone abroad, spent most of his time in Crete, because of the kinship connection; for the Lyctians were colonists from Sparta, and those who went to the colony adopted the order characteristic of laws existing among the inhabitants at that time. That is why even now their subject peoples employ these in the same way, on the supposition that Minos first established the order characteristic of their laws.

The island seems naturally well suited and situated to rule the Greek world; for it lies across the entire sea on whose shores pretty much all of the Greeks are settled; for in one direction it is not far from the Peloponnese, and in the other not far from Asia (the part around Cape Triopium) or from Rhodes. That is why Minos obtained the rule over the sea as well, subjugating some islands, sending settlers to others, and finally attacking Sicily, where he met his death near Camicus.

The Cretan order is analogous to the Spartan. For the helots do the farming for the latter, while the subject peoples do it for the former. Also, both cities have communal messes (and, at any rate in ancient times, the Spartans called these not *phiditia* but **1272ª1** *andreia* ("men's messes") like the Cretans—a clear indication that these came from Crete). Further, there is the order characteristic of the constitution; for the overseers have the same powers as the "order-keepers" (as they are called in Crete), except that the overseers are five in number, while the order-keepers are ten. The senators, whom the Cretans call the "council," are the equals of the Spartan senators. As for kingship, there used to be one in earlier times, but the Cretans did away with it, and the order-keepers have the leadership in war. All share in the assembly, but it has control of nothing except the ratification by vote of the resolutions of the senators and order-keepers.

Matters relating to the communal messes are better handled by the Cretans than by the Spartans. In Sparta, as was said previously,[82] each person must contribute a fixed per capita amount, and, if he does not, a law prevents him from sharing in

82. 1271^{a}29–37.

the constitution, while in Crete they are handled in a more communal way; for, out of all the public crops and livestock and the tributes paid by the subject peoples, one part is set aside for the gods and for communal public services, and another for the communal messes, so that all—women and children and men—are fed at public expense. The legislator regarded moderation in eating as advantageous and devoted much philosophizing to furthering it. And as regards the segregation of women, in order to prevent them from having many children, he has made a place for sexual relations between men—as to whether this was badly done or not badly done, will be investigated on another occasion.[83] It is evident, then, that matters relating to the communal messes have been better ordered by the Cretans than by the Spartans.

Matters relating to the order-keepers, on the other hand, are even worse than those relating to the overseers. For while what is bad in the board of overseers is also bad in the board of order-keepers (for it is composed of random people), what is for the advantage of the constitution there does not exist here. For there, the election being from all, the people share in the most important office, and so wish the constitution to continue. Here, by contrast, the order-keepers are elected not from all but from certain families, and the senators are elected from those who have been order-keepers. And one might make the same arguments about the Cretan senators as about those who become senators in Sparta (for their exemption from inspection and their life-tenure are greater prerogatives than they are worthy of, and it is dangerous that they rule not in accord with what is written down, but on the basis of their own consideration).

The fact that the people remain at peace even though they do not share in [the most important office] is no sign that it has been well-ordered; for there is no profit in it for the order-keepers, as there is for the overseers, because they live on an island, far away indeed from any who might corrupt them.

As for the cure the Cretans use for this error,[84] it is strange and characteristic not of a political constitution but of a dynasty. For the order-keepers are frequently expelled by a conspiracy either of their fellow rulers themselves or of private individuals, and it is also possible for the order-keepers to resign office in the middle of their term. But surely it is better if all these things should take place in accord with law and not with the wish of human beings; for the latter is not a safe standard.

Worst of all, however, is the suspension of order-keepers, which the powerful frequently put in place, when they wish to escape punishment at the hands of justice, which makes it clear that the order has something of a constitution about it, yet is not a constitution but more of a dynasty. And their habit is to create anarchy, form factions, and fight each other by dividing the people and their own friends into parties. And yet how does this sort of thing differ from the city ceasing to be

83. Not in the extant *Politics*.

84. Restricting the senators and order-keepers to certain families.

such for a period of time and the political community dissolving? But a city in this condition is in great danger, when those who wish to attack it are also able to do so. But, as was said, Crete is preserved by its location; for its remoteness has served to keep foreigners out. That is why the institution of subject peoples survives among the Cretans, while the helots frequently revolt. For the Cretans do not share in external rule—although a foreign war has recently come to the island, which has made the weakness of its laws evident.

About this constitution, then, let this much be said.

2.11
The Carthaginian Constitution

The Carthaginians also seem to manage their constitution well, and in many respects in an extraordinary way as compared to other people, although in some respects mostly much the same as that of the Spartans. For these three constitutions, the Cretan, Spartan, and, third among them, the Carthaginian, are all in a way very close to each other and very different from the others. Many of their ordinances are well-handled, and it is a sign that their constitution is well-ordered that the people stand by the order characteristic of the constitution, and that no faction even worth speaking about has arisen among them, and no tyrant either.

This constitution has elements that are much the same as in the Spartan constitution. The messes of the *hetairiai* are like the *phiditia*, while the office of the one-hundred-and-four is like that of the overseers, except that it is not worse (for the overseers are drawn from random people, while the Carthaginians elect to this office on the basis of worth). And their kings and senate are analogous to the Spartan ones. Also, it is better that the kings are neither a separate family nor a random one at that, but if any family distinguishes itself, then it is from its members that they are elected, rather than in accord with age. For, since they control the important matters, if they are worthless people, they will do great harm to the city—as they already have to the city of the Spartans. **1273^{a}1**

Most of the criticisms one might make because of the deviations [from the best constitution] are in fact common to all the constitutions mentioned. But of those that are deviations from the hypothesis of an aristocracy or a polity, some lean more in the direction of democracy, others more in the direction of oligarchy. For the kings and senators control what to bring and what not to bring before the people, provided they all agree, but if they do not agree, the people control these matters too. And when the rulers make proposals, the people are allowed not only to hear their proposals out, but also have control of deciding them, and anyone who wishes may speak against the proposals being made—which is precisely what does not exist in the other constitutions.

On the other hand, it is oligarchic that the boards of five, which control many and important matters, elect themselves, and also elect to the office of one-hundred,[85] which is the most important office, and further, hold office longer than the others (for they rule before taking office and after they have left it). But one must count as aristocratic the fact that they are neither paid nor chosen by lot, and anything else of that sort, and also that all suits are judged by the boards of five, and not, as in Sparta, some by some and others by others.

However, the order characteristic of the Carthaginians deviates away from aristocracy and toward oligarchy most of all in line with a thought held also by ordinary people; for they think that rulers should be chosen not solely on the basis of merit but also on the basis of wealth; for it is impossible for a poor person to rule well—that is, to be at leisure to do so. Hence, if indeed it is oligarchic to choose rulers on the basis of wealth, and aristocratic to choose them in accord with virtue, then this will be a third sort of order, in accord with which the Carthaginians have ordered matters relating to the constitution; for they elect with a view to both [criteria], especially in the case of the most important offices, the kings and the generals.

But this deviation from aristocracy must be regarded as an error on the part of the legislator. For one of the most necessary things to see to from the start is that the best people are able to be at leisure and to avoid doing anything unseemly, not only when in office but also in private life. But if one must look to wealth too, for the sake of leisure, it is bad that the most important offices, those of king and general, should be for sale. For this law makes wealth more estimable than virtue, and makes the entire city money-loving, and whatever it is that the controlling element [of the city] takes to be estimable, the belief of the other citizens will necessarily follow its belief. And where virtue is not esteemed most highly, the constitution cannot be stably governed as an aristocracy. It is also reasonable to expect that those who have bought office, that is, when they rule by having spent money, will become habituated to making a profit from it; for if a poor but decent person will want to profit from office, it would be strange if a worse one, who has already spent money, will not wish to do so. That is why those who are best able to rule[86] should rule. And even if the legislator neglected the wealth of the decent people, he had better take care of their leisure, at any rate, while they are ruling.

It would also seem to be bad for the same person to hold more than one office, which is precisely what is held in high repute among the Carthaginians; for one work is best completed by one person. The legislator should see to it that this is what happens, and not require the same person to play the pipe and make shoes. So, where the city is not small, it is more suited to political rule, and more democratic, if more people participate in the offices; for it is more communal, as we said, and each of the same things is better carried out and more quickly. This is clear in the case of military

85. I.e., the office of the one hundred and four (1272b34–35).
86. Reading ἄρχειν.

and naval affairs; for in both of them ruling and being ruled extend through (one might almost say) everyone.

But though their constitution is oligarchic, they are very good at escaping faction, because it is forever the case that some part of the people grows rich due to their sending it out to the [dependent] cities. In this way they effect a cure and make their constitution steadfast. But this is the result of luck, while they should be free of factional conflict because of the legislator. As things stand, however, if some misfortune occurs and the multitude of those who are ruled revolt, there is no remedy for restoring peace through the laws.

As regards the Spartan, Cretan, and Carthaginian constitutions, which are quite justly held in high repute, this is the way things stand.

2.12
The Constitution of Solon and Other Legislators

Some of those who have had something to say about a constitution took no part whatever in political actions, but always lived a private life. About them pretty much everything worth saying has been said. Others became legislators, some for their own cities, others for some foreign ones as well, because they engaged in politics themselves. Some of these crafted laws only, while others, such as Lycurgus and Solon, crafted a constitution too; for these put in place both laws and constitutions.

The Spartan constitution has already been spoken about,[87] and, as for Solon, some people think that he was an excellent legislator because he abolished an oligarchy that was too unmixed, put an end to the slavery of the people, and put in place the ancestral democracy, by mixing the constitution well—for the council of the Areopagus is oligarchic, the fact that officials are elected is aristocratic, and the courts are democratic. It would seem that Solon found the first two—the council and the election of officials—already in existence and did not abolish them, while by making juries open to all, he did set up the people [in power].

That is why indeed some people find fault with him; for they say that when he gave juries, which were chosen by lot, control of everything, he undid the other two [elements of the constitution]. For when this element became strong, those who gratified the people as if it were a tyrant changed the constitution into the present democracy. Indeed, Ephialtes and Pericles curtailed the power of the Areopagus, and Pericles introduced payment for judges, and in this way each popular leader developed the power of the people and led them on to the present democracy.

It appears, however, that this did not come about in accord with Solon's deliberate choice, but rather by accident (for because the people were the cause of Athens' naval supremacy during the Persian Wars, they became presumptuous, and chose

87. 2.9.

base people as their popular leaders when the decent ones proposed policies opposed to their own), since Solon, at any rate, seems to have given the people only the very minimum power necessary—that of electing and inspecting officials (for if they do not even control these, the people would be slave and enemy [of the constitution]), but drew all the officials from among the notable and rich: the five-hundred bushel-men, the yoke-men, and the third, the so-called cavalrymen, while the fourth, the day-laborers,[88] had a share in no office.

Others also became legislators: Zaleucus became legislator for the Epizephyrian Locrians, and Charondas of Catana for his own citizens and for the other Chalcidian cities in Italy and Sicily. (Some people actually try to connect them, on the supposition that Onomacritus, a Locrian, was the first person to become an expert in legislation, having been trained in Crete when he visited there in connection with his craft of divination, that Thales was his companion, and that Lycurgus and Zaleucus were pupils of Thales, and Charondas of Zaleucus. But when they say these things, they speak without regard to chronology.)

There was also Philolaus the Corinthian, who became a legislator for the Thebans. He was a member of the Bacchiad family and became the lover of Diocles, the victor in the Olympic Games. This Diocles left the city of Corinth because of his bitter hatred of the sexual passion that his mother, Alcyone, had for him, and went off to Thebes, where he and Philolaus both ended their days. Even now people point out their tombs, which are in full view of each other, although one has a view toward the land of the Corinthians, while the other does not; for the story goes that they arranged to be buried in this way, Diocles, because of his hatred of [his mother's passion], so that the land of Corinth would not be visible from his burial mound, Philolaus so that it would be visible from his. It was due to this sort of cause, then, that the two of them dwelt among the Thebans. Philolaus became legislator for them both on other matters and concerning procreation (which they call "the laws of adoption"). This is special to his legislation, its purpose being to preserve the [same] number of estates.

There is nothing special to Charondas' legislation except suits for perjury (for he was the first to introduce denunciations for this). But in the exactness of his laws, he is more polished than even present-day legislators.

The feature special to Phaleas is the leveling of property—while to Plato it is the sharing of women, children, and property, communal messes for women, and further, the law about drinking, that the sober should preside at symposia, and the one requiring ambidextrous training for soldiers, on the grounds that one of the hands should not be useful and the other useless.

There are also Draco's laws, but it was for an existing constitution that he set up laws. There is nothing special to his laws worth speaking about, except their harshness due to the magnitude of the punishments.

88. Cf. *Ath*. 7.3–4.

Pittacus too crafted laws but not a constitution. A law special to him requires drunken people to be punished more severely, if they make a misstep, than sober ones. For because more people commit acts of wanton aggression when drunk than when sober, Pittacus looked not to the fact that greater indulgence should be shown to those who are drunk but to what is advantageous.

Androdamus of Rhegium became a legislator for the Chalcidians in the region of Thrace, and to him belong those dealing with homicides and heiresses. But there is nothing special to him that one might report.

As regards the various constitutions, then, both those that have control [in actual cities] and those described by certain people, let this be the way to get a theoretical grasp on them.

BOOK 3

3.1
City and Citizen

For someone investigating constitutions, that is, what each is and what sort of thing it is, pretty much the first investigation concerns the city, to see what exactly the city is. For as things stand, there are disputes about this, some saying that it is the city that performed a certain action, while others say that it is not the city, but rather the oligarchy or the tyrant. And we see that the politician's and the legislator's entire study concerns the city, and that the constitution is itself a certain ordering of those who inhabit the city. But since the city belongs among composite things, and things that are wholes and composed of many parts, it is clear that the first thing that must be investigated is the citizen; for a city is a particular sort of multitude of citizens. So who should be called a "citizen," and what the citizen is, must be investigated. For in **1275^{a}1** fact there is often a dispute about the citizen as well; for not everyone agrees that one and the same person is a citizen; for someone who is a citizen in a democracy is often not one in an oligarchy.

One must leave aside those who acquire the title of citizen in some other way—for example, the ones who are created citizens. Nor is the citizen a citizen through dwelling in a place (for both resident aliens and slaves share the dwelling place). Nor are those people citizens who share in matters of justice to the extent of undergoing trial or suing (for parties to treaties can also do that). In fact in many places not even resident aliens share completely in these things, but must find a "champion," so that they participate in this sort of community in an incomplete sort of way. Like children who are too young to be registered [as citizens] or old people who have been discharged, these people must be said to be citizens in a way, not unconditionally so, but rather with the addition of "incomplete" or

"superannuated" or something else of this sort (it makes no difference; for what is meant is clear). For we are inquiring about the unconditional citizen, the one who has no defect of this sort that needs to be rectified, since one can also go through and solve similar puzzles about those who have been disenfranchised or exiled.

The unconditional citizen is defined by nothing else so much as by his participation in judgment and office. But some offices are determined with respect to time, so that in some cases they cannot ever be held twice by the same person, or only after a definite period. Another [officeholder], however, holds office indefinitely, such as the judge or the assemblyman. Perhaps someone might say that the latter are not officials at all, and do not, because of doing what they do, share in office. And yet surely it would be absurd to deny that those with the most control are officials. But let this point pass; for the argument is about a name. For what is common to a judge and an assemblyman lacks a name that could apply to both. For the sake of determining it, then, let us call it "indefinite office." We take it, then, that those who share in office in this way are citizens.

So the definition that best fits all those called "citizens" is pretty much one of this sort. But one must not overlook the fact that in the case of things in which the underlying subjects differ in form, with one coming first, another second, and so on, either the common element is not present at all, insofar as these things are what they are, or only in some rudimentary way. We see that constitutions differ in form from each other, and that some are posterior and others prior; for erroneous or deviant constitutions are necessarily posterior to those that are not erroneous. (What we mean by "deviant" will be evident later on.[89]) So it is necessary for the citizen in the case of each constitution to be different too.

That is why the citizen that was mentioned is above all a citizen in a democracy, and may possibly be so in other constitutions, but not necessarily. For in some constitutions there is no democratic body, nor is there a legally recognized assembly, but rather [specially] summoned councils, and judicial cases are tried in special courts. For example, in Sparta some cases concerning contracts are tried by one overseer, others by another, while cases of homicide are tried by the senate, and other cases by perhaps some other official. And it is the same way in Carthage; for there particular officials judge all judicial cases.

But our definition of a citizen admits of correction. For in the other constitutions, it is not the holder of indefinite office who is assemblyman and judge, but someone whose office is definite; for it is either to some or to all of the latter that deliberation and judgment, whether about some or about all matters, is assigned.

Who the citizen is, then, is evident from these considerations; for whoever is authorized to share in deliberative or[90] judicial office, we can now say, is a citizen of

89. 3.6–7.
90. Reading ἢ.

the relevant city, and a city, simply speaking, is a multitude of such people adequate for self-sufficiency in living.

3.2
Pragmatic Definitions of the Citizen

But the definition that gets used in practice is that a citizen is someone who comes from citizens on both sides, and not just on one—for example, on the father's or on the mother's. And some go even further back, looking for two or three or more generations of ancestors. But quick,[91] political definitions of this sort lead some people to raise a puzzle about how that third- or fourth-generation ancestor will be a citizen. Hence Gorgias of Leontini, half perhaps to raise a real puzzle and half in jest, said that just as mortars are things made by mortar-makers, so Larissaeans too are what are made by craftsmen; for some craftsmen are Larissaean-makers.[92] But the puzzle is a simple one. For if the ancestors shared in the constitution in the way that is in accord with the definition just given, they were citizens; for "what comes from a citizen father or mother" cannot even be applied to the first inhabitants or founders.

But more of a puzzle is perhaps raised by the case of those who come to share in a constitution after its being changed, such as the citizens created in Athens by Cleisthenes[93] after the expulsion of the tyrants; for he adopted many foreigners and alien slaves into the tribes. But the dispute in the case of these people is not about which of them is a citizen, but whether they are justly or unjustly so. And yet a further puzzle might be raised as to whether someone who is not justly a citizen is not a citizen at all, as "unjustly" and "falsely" seem to have the same force. But since we **1276^{a}1** see that there are also some people holding office unjustly, whom we say are holding it, albeit not justly, and since a citizen is defined by his holding a sort of office (for someone who shares in office of this sort is a citizen, as we said), it is clear that these people too must be said to be citizens.

3.3
The Identity of a City

The puzzle about justly and not justly is connected to the dispute mentioned previously.[94] For some people raise a puzzle about how to determine when a city has or has not performed an action—for example, when from an oligarchy or a tyranny a democracy comes about. At these times, some do not wish to honor treaties, as it

91. Reading ταχέως.
92. A Larissaean was both a citizen of Larissa and a type of pot made there.
93. *Ath.* 20.1–22.1, 29.3, 41.2.
94. 1274^{b}34–36.

was not the city, but its tyrant who entered into them, or many other things of the same sort, on the grounds that some constitutions exist by the exercise of power and not because of being for the common advantage. If indeed, then, some cities are democratically ruled in this way, it must be conceded that the actions of this constitution are the actions of this very city in the same way as those of the oligarchy or the tyranny.

This argument seems to be akin to the puzzle of when one is to say that a city is the same, or not the same but a distinct one. The most obvious way to inquire about this puzzle is by looking to the location and the human inhabitants; for it is possible for a city's location and its human inhabitants to come apart, and for some to live in one place and some in another. That is why the puzzle must be counted as a rather tame one (for the fact that something is said to be a city in many ways makes inquiry about such puzzles in a way easy).

Things are similar if one asks when the people inhabiting the same location should be considered to be one city. Not, certainly, because it is enclosed by walls; for one wall could be built around the Peloponnese. Perhaps Babylon is like this, or anywhere else that has the dimensions of a nation rather than a city. At any rate, they say that after its capture a part of the city was not aware of it for three days.

But it will be useful to investigate this puzzle on another occasion[95] (for the size of the city, both as regards numbers and as regards whether it is advantageous for it to have one[96] or several [locations], should not be overlooked by the politician).

But where the same human beings are inhabiting the same place, is the city to be called "the same" as long as the inhabitants remain of the same stock, even though all the time some are passing away and others coming to be—just as we are accustomed to say that rivers and springs remain the same, even though all the time water is flowing in and flowing out? Or is one to say that while human beings can remain the same due to this sort of cause, the city is different? For if indeed a city is a sort **1276b1** of community, a community of citizens sharing in a constitution, then, when the constitution becomes another one in form, that is, becomes different, it would seem that the city too is not the same. At any rate, just as we say that a chorus that is at one time comic and at another tragic is a different chorus, even though the human beings in it are often the same. In the same way too any other community or composite is different if the form of the composite is different—for example, we say that a harmony composed of the same notes is a different harmony if it is at one time Dorian and at another Phrygian. If, then, this is how things are, it is evident that a city must be said to be the same city by looking above all to its constitution. But the name to call it may be different or the same one whether its inhabitants are the same or altogether distinct human beings.

95. 7.6.
96. Secluding ἔθνος.

But whether it is just to honor or not to honor agreements when a city changes to a different constitution requires another argument.

3.4
Virtues of Man and Citizen, Rulers and Ruled

Connected with the issues just now discussed is the investigation of whether to count the virtue of a good man and of an excellent citizen as the same or not the same. But then if this is what the investigation should be about, surely the virtue of a citizen must first be grasped in some sort of outline.

Just as a sailor is one of the members of a community, so too, we say, is a citizen. And though sailors are dissimilar in their capacities (for one is an oarsman, another a captain, another a lookout, and others have other sorts of titles), it is clear both that the most exact account of the virtue of each sort of sailor will be special to him and that there will also be some common account that fits them all alike. For the preservation of the ship while sailing is a work of all of them; for this is what each of the sailors desires. In the same way, then, the citizens too, even though they are dissimilar, have the preservation of the community as their work, and the constitution is the community. That is why the virtue of a citizen must be relative to the constitution. If, then, there are indeed several forms of constitutions, it is clear that there cannot be one virtue that is the virtue of an excellent citizen: complete virtue. But the good man, we say, is such in accord with one virtue, the complete one. It is evident, then, that it is possible for someone to be an excellent citizen without having acquired the virtue in accord with which someone is an excellent man.

By going through the puzzles in a different way, the same argument can be made about the best constitution. For if it is impossible for a city to be composed entirely of those who are excellent, but each must at least do his own intrinsic work well, and this is doing it out of virtue, and since it is impossible for all the citizens to be similar, then there cannot be one virtue of a citizen and of a good man. For that of an excellent citizen must belong to all (for this is necessary if the city is to be best), but the virtue of a good man cannot be had by all, unless it is necessary for all the citizens in an excellent city to be good men.

Further, since a city consists of dissimilar inhabitants (that is, just as an animal straightaway consists of soul and body, a soul of reason and desire, a household of man and woman, and property of master and slave, so a city too consists of all these, and of other dissimilar forms in addition), the virtue of all the citizens cannot be one virtue, just as the virtue of the leader of a chorus and that of one of its ordinary members cannot be one virtue either.

Why the virtue of man and of a citizen are not unconditionally the same, then, is evident from these considerations, but will the virtue of a certain sort of excellent citizen and that of an excellent man be the same? We say that an excellent ruler is good

and practically wise, but it is not necessary for a citizen to be practically wise. Also, some say that the education of a ruler is different right from the start—as is evident in the case of the sons of kings, who are educated in horsemanship and warfare, and in Euripides, when he says, "No subtleties for me . . . but what the city needs" (the supposition being that there is a sort of education proper to a ruler). But if the virtue of a good ruler and of a good man is the same, and if the one who is ruled is also a citizen, then the virtue of a citizen would not be unconditionally the same as that of a man (although that of a certain sort of citizen would be); for the virtue of a ruler and a citizen would not be the same. Perhaps that is why Jason said that he went hungry except when he was being a tyrant, on the assumption that he lacked the scientific knowledge of how to be a private citizen.

But then someone is surely praised for being able to rule and be ruled, and being able to do both of them well seems to be the virtue of a reputable citizen. If, then, we take a good man's virtue to be ruling virtue, but a citizen's to be both ruling and ruled, then the two virtues would not be praiseworthy in the same way.

Since, then, they seem to be distinct in some cases, and that it is not the same things that should be learned by the ruler and the ruled, while a citizen should have scientific knowledge of both and share in both, one may see what follows from that.

For there is rule of a master—by which we mean the sort concerned with the necessities. It is not necessary for the ruler to have scientific knowledge of how to perform these [works], but rather of how to use [those who do]. In fact, the former is slavish. (By "the former" I mean the capacity to do in someone's service the actions of a servant.) But there are several forms of slave, we say; for the sorts of work they do vary. Among these, one part is that done by manual laborers. These are people, as their name itself signifies, who live by their hands. The unrefined craftsman is included among them. That is why among some peoples craftsmen did not share in office in former times, until extreme democracy arose. Thus the works performed by people ruled in this way should be learned neither by the good politician nor by the[97] good citizen, unless for himself out of some need of his own; for then it is no longer a case of one person becoming master and the other slave.

But there is also a sort of rule exercised over those who are similar in kind and free. For this is what we say is political rule, and the ruler must learn it by being ruled, just as one learns to be a cavalry commander by serving under a cavalry commander, to be a general by serving under a general, and [similarly] under a major, or company commander. That is why this too is well said[98] that one cannot rule well unless one has been ruled. And while the virtues of these are distinct, the good citizen must have the scientific knowledge needed and the ability both to be ruled and to rule, and this is the virtue of a citizen, to know the rule of free people from both sides.

97. Retaining οὐδὲ τὸν.
98. Solon (DL 1.60, 174–175).

In fact, the good man has both virtues, even if a distinct form of justice and temperance is characteristic of a ruler. For if in fact a good man is ruled, but is a free citizen, it is clear that his virtue (justice, for example) is not one thing, but includes one form for ruling and another for being ruled, just as a man's and a woman's temperance and courage are distinct (for a man would seem a coward if he were courageous in the way a woman is courageous, and a woman would seem garrulous if she were moderate in speech in the way a good man is, since even household management is of distinct sorts for a man and a woman; for his work is to acquire property and hers to preserve it). Practical wisdom, by contrast, is the only virtue special to a ruler. For the others, it would seem, must be common to both rulers and ruled. At any rate, the virtue of someone ruled is not practical wisdom but true belief; for those ruled are like makers of pipes, while rulers are like the pipe players who use them.

Whether, then, the virtue of a good man and that of an excellent citizen are the same or distinct, and in what way they are the same and in what way distinct, is evident from these considerations.

3.5
Should Craftsmen Be Citizens?

One of the puzzles about the citizen still remains. For is it really the case that a citizen is someone to whom it is open to have a share in office, or must unrefined craftsmen also be counted as citizens? If, indeed, those who do not share in office must be counted as citizens, the sort of virtue we discussed cannot belong to every citizen (for these craftsmen will then be citizens). On the other hand, if none of these sorts is a citizen, in which part of the city must they each be put? For they are neither resident alien nor foreigner.

Or will we say that nothing absurd follows—at any rate, not because of this argument? For slaves and freed slaves are not among those just mentioned, either. **1278^{a}1** In fact, the truth is that not everyone without whom there would not be a city is to be counted as a citizen, since not even children are citizens in the same way that men are. Instead, the latter are unconditional citizens, while the former are so on the basis of a hypothesis; for though they are citizens, they are incomplete ones. Among some peoples in ancient times the unrefined element was slave or foreign, which is why most of them are such even now. And the best city will not confer citizenship on an unrefined person. But if [in other cities] even this sort of person is a citizen, then what we have said is a citizen's virtue must not be ascribed to everyone, or even to all free people, but only to those who are released from the necessary works. Among the necessary ones, those who perform services of this sort for an individual are slaves; those who perform them for the community are unrefined and hired laborers.

It will become evident, if we carry our investigation a little further, how things stand with these people. For what has been said[99] makes this clear. For since there are several constitutions, there must also be several forms of citizen, and above all of citizens who are being ruled, so that in some constitutions the unrefined element and the hired laborer must be citizens, while in others it is impossible—for example, in any so-called aristocracy, that is, one in which offices are awarded in accord with virtue and in accord with worth; for it is impossible to engage in virtuous pursuits while living the life of an unrefined person or a hired laborer.

In oligarchies, on the other hand, while it is not possible for hired laborers to be citizens (for participation in offices is based on high property assessments), it is possible for an unrefined person; for in fact many craftsmen become rich. (In Thebes there used to be a law that anyone who had not kept away from the market for ten years could not share in office.)

But in many constitutions the law goes so far as to invite even some foreigners to be citizens; for in some democracies the descendant of a citizen mother is a citizen, and in many places the same holds of bastards too. Nonetheless, since it is because of a shortage of legitimate citizens that they make such people citizens (for it is because of underpopulation that they employ laws in this way), when they are well supplied with a mob of them, they gradually disqualify, first, those with a slave as father or mother, then those with citizen mothers [alone], until finally they make citizens only of those who come from citizens on both sides.

It is evident from these considerations, then, that there are several forms of citizens, and that the one who is above all said to be a citizen is the one who shares in the honors of office, as Homer too implied when he wrote, "like some dishonored vagabond";[100] for the one who does not share is like a resident alien. And whenever this sort of thing is kept concealed, it is for the sake of deceiving fellow inhabitants.

And whether, then, to count the virtue in accord with which a man is good and a citizen is excellent as the same or as distinct is clear from what has been said: in one sort of city the good man and the excellent citizen are the same, while in another they are distinct. And that man is not just anyone; rather, he is the politician, that is, the one who controls or is capable of controlling, either by himself or with others, the supervision of community affairs.

3.6
Correct and Deviant Constitutions

Since these issues have been determined, what comes after this must be investigated, whether one must take it that there is one constitution or several, and, if there are several, what they are, how many they are, and how they differ.

99. 3.1.
100. *Iliad* 9.648, 16.59.

A constitution is an ordering of a city and of its various offices, and above all of the office that controls everything. For in every case the governing body controls the city, and the constitution is the governing body. I mean, for example, that in democratic cities the people are in control, while in oligarchic ones, on the contrary, the few are. And we say that the constitution too is different in these cases. And we will state the same account about the others as well.

First, then, it must set down what a city is set up for, and how many forms of rule are concerned with human beings and their community in living.

In our first discussions, then, where determinations were made about household management and rule of a master, it was also said that a human being is by nature a political animal.[101] That is why, even when they do not need each other's assistance, people desire no less to live together. Nonetheless, it is also true that the common advantage brings them together, to the extent that some share of noble living falls to each. It is especially this, then, that is the end both of all communally and of each separately. But they also come together and maintain the political community for the sake of living itself. For there is presumably some share of the noble present even in living itself alone, as long as the hardships in life are not too excessive. In any case, it is clear that most human beings are willing to endure much misery in order to cling to living, on the supposition that there is a sort of joy in it and a natural sweetness.

But then it is also easy to distinguish, at any rate, the modes of rule that are spoken about, since even in the external accounts they are often discussed. For rule of a master, although in truth the same thing is advantageous for both what is by nature a master and what is by nature a slave, is nonetheless rule exercised with a view to the master's own advantage, though coincidentally with a view to that of the slave (for if the slave is destroyed, the mastership cannot be preserved).

On the other hand, rule over children, wife, and the household (*oikia*) generally, which we call "household management (*oikonomikê*)," is either for the sake of the ruled or for the sake of something common to both ruled and ruler. Intrinsically, it is for the sake of the ruled, as we also see in the various crafts (for example, medicine and athletic training), but coincidentally it may be for the rulers as well. For nothing **1279^{a}1** prevents a coach from sometimes being one of those being trained, just as a ship's captain is always one of the sailors. A coach or a ship's captain looks to the good of the ruled, but when he too becomes one of them himself, he shares coincidentally in the benefit. For in the one case he is a sailor, and in the other, though still a coach, he becomes one of the trained.

That is why, in the case of political offices too, where they have been set up in accord with the equality of the citizens and their similarity, the citizens expect to rule in turns. In the past, as is natural, they expected to perform public service when their turn came, and then to have someone else look to their good in turn, just as they had previously looked to his advantage when they were ruling. Nowadays, however,

101. 1253^{a}7–8.

because of the benefits to be had from public funds and ruling office, people wish to rule continuously, as if being always healthy resulted for those sick people who [always] rule. At any rate, the latter would presumably pursue ruling office in that sort of way.

It is evident, therefore, that those constitutions that aim at the common advantage are, in accord with what is unconditionally just, correct, while those that aim only at the advantage of the rulers are erroneous, and deviations from the correct constitutions; for they are like the rule of a master, while a city is a community of free people.

3.7
The Classification of Constitutions

Now that these matters have been determined, the next thing is to investigate how many constitutions there are and what they are, starting with the correct ones; for in fact the deviations will be evident once these have been defined.

Since constitution and governing body signify the same thing, and the governing body is what has control in cities, and the one in control must be either one person, or few, or many, then, whenever the one, the few, or the many rule with a view to the common advantage, these constitutions must be correct, while those that do so with a view to the private advantage, whether of the one, the few, or the multitude, they are deviations. For either those who share[102] must not be called "citizens," or they should share in the advantages.

Among monarchies, the one that looks to the common advantage is usually called a "kingship," and rule by a few, but more than one, an "aristocracy" (either because the best people rule, or because they rule with a view to what is best for the city and those who share in it), while when the multitude governs with a view to the common advantage, the constitution is called by the name "polity (*politeia*)," which is common to all constitutions (*politeiai*). Moreover, this happens reasonably; for while it is possible for one or a few to be superior in virtue, in the case of more people it is already difficult for them to be exact practitioners of every sort **1279b1** of virtue—the major exception being military virtue; for this does come about in a multitude. That is why in this constitution the element that goes to war on its behalf is the one with the most control, and why those who possess their own weapons are the ones who share in it.

Deviations from the ones mentioned are tyranny from kingship, oligarchy from aristocracy, and democracy from polity. For tyranny is monarchy with a view to the advantage of the monarch, oligarchy with a view to the advantage of the rich, and democracy with a view to the advantage of the poor. But none of them is for the common profit.

102. Rejecting the addition of μὴ.

3.8
Defining Oligarchy and Democracy

But it is necessary to say a little more about what each of these constitutions is; for certain puzzles are involved, and, in the case of each methodical inquiry, it is appropriate for the person who is carrying it out in a philosophical manner, and not merely with a practical purpose in view, not to overlook or omit anything, but to make clear the truth about each.

A tyranny, as was said, is a monarchy that exercises the rule of a master over the political community, an oligarchy is when those who control the constitution are the ones who have the properties, and a democracy, on the contrary, is when those who control it do not have much property, but are poor.

The first puzzle concerns definition. For suppose that the majority were rich and controlled the city, and that it is a democracy whenever the majority has control. In the same way again suppose that the poor are fewer in number than the rich, but are stronger and control the constitution, but that when a small group is in control it is said to be an oligarchy. It would seem, then, that these constitutions have not been correctly defined.

But then even if one were to combine being few with being rich, in the one case, and being a majority with being poor, in the other, and to describe the constitutions accordingly—oligarchy as that in which the rich are few in number and hold the offices, and democracy as that in which the poor are many and hold them—another puzzle arises. For what are we to call the constitutions we just described, those where the rich are a majority and the poor a minority, but each controls in its own constitution, if indeed there is no other constitution besides those mentioned?

What this argument seems to make clear, therefore, is that it is coincidental that the few or the many are in control in oligarchies or in democracies, and that this is because the rich are everywhere few and the poor many. That is why, in fact, the causes just mentioned are not the causes of any differences between the constitutions. What does differentiate democracy and oligarchy from each other is poverty and wealth, that is, whenever some, whether a minority or a majority, rule because of their wealth, the constitution is necessarily an oligarchy, and whenever the poor rule, it is **1280^{a}1** necessarily a democracy. But it turns out, as we said, that the former are in fact few and the latter many. For only a few people are rich, but in freedom all share. And it is due to these causes that both groups dispute over the constitution.

3.9
Justice and the End of the City

The first thing one must grasp, however, is what they say the defining marks of oligarchy and democracy are, and what both oligarchic justice and democratic justice are.

For all grasp a sort of justice, but they only go to a certain point and do not discuss the whole of what is just in the strictest sense. For example, justice seems to be equality, and it is—not for everyone, however, but for equals. Justice also seems to be inequality, and in fact it is—not for everyone, however, but for unequals. They do away with this—the for whom—and so judge badly. The cause is that the judgment concerns themselves, and pretty much most people are bad judges about their own affairs.

So, since what is just is just for certain people, and consists in dividing both things and people in the same way (as was said previously in the *Ethics*[103]), they agree about equality in the thing but disagree about the for whom. This is mostly because of what was just mentioned, that they judge badly about what concerns themselves, but also because, by both of them speaking up to a point about a sort of justice, they consider themselves to be speaking about justice unconditionally. For one lot, if they are unequal in one respect (for example, wealth), think that they are wholly unequal, while the other lot, if they are equal in one respect (for example, freedom), think that they are wholly equal. About what has the most control, however, they do not speak. For if it were for the sake of property that people formed a community and came together, then they would share in the city to the extent that they shared in property, and the oligarchic argument would as a result seem to be a strong one; for [they would say] it is not just for someone who has contributed one mina to share equally in a hundred minas with the one who has contributed all the rest, whether of what was there at the start or of the interest.

But they do not do these things only for the sake of living, but more for the sake of living well; for otherwise there could also be a city of slaves and of the other animals, while as things stand there is not one, because these share neither in happiness nor in living in accord with deliberate choice.

Nor do they do them for the sake of an alliance, to safeguard themselves from being treated unjustly by anyone, or because of exchange and their usefulness to each other—for otherwise in fact the Etruscans, the Carthaginians, and all those who have treaties with each other would be like citizens of one city. At any rate, they have import agreements, treaties about not doing injustice, and formal documents of alliance. No offices, however, that are common to all of them have been put in place to deal with these matters, but rather each city has distinct ones. Nor are those in one city concerned that those in the other should be of a certain quality, not even that those covered by the agreements should not be unjust or depraved in any way, but only that they should not act unjustly toward each other. By contrast, political virtue and vice are closely investigated by those concerned with good legislative order. Thus it is quite evident that the city must be concerned with virtue—at any rate, the city that is truly, and not just for the sake of argument, so called. For otherwise the community becomes

103. *NE* 5.5.

an alliance, differing only in location from the other alliances in which the allies live far apart, and law becomes an agreement, and, as Lycophron the sophist said, "a guarantor of just behavior toward each other," but not such as to make the citizens good and just.

It is evident that this is the way it is. For even if their territories were brought together into one, so that the city of the Megarians and that of the Corinthians were fastened together by surrounding walls, it still would not be a single city. Nor would it be so if their citizens intermarried, and yet this is one of the sorts of community that is special to cities. Nor, similarly, if there were some who lived in separate places, yet not so far apart as to share nothing communally, and had laws against doing injustice to each other in their business transactions (for example, if one were a carpenter, another a farmer, another a shoemaker, another something else of that sort, and their number were ten thousand), yet their community was in nothing else besides such things as exchange and alliance—not even in this case would there be a city.

What, then, is the cause of this? Surely, it is not because of the non-proximity of their community. For even if, while forming a community of this sort, they came together, yet each treated his own household like a city and the others as if a defensive alliance existed, coming to their aid only against those committing injustice—even so, they still would not seem to be a city to those who get an exact theoretical grasp on such things, if indeed they continued to associate with each other in the same manner when together as they did when separated.

It is evident, therefore, that a city is not a community of location, nor one either for the sake of preventing mutual injustice or for the sake of exchange. On the contrary, while these must be present if indeed there is to be a city, when all of them are present it is nonetheless no city yet. Rather, the city is the community in living well for both households and families, that is, for the sake of complete and self-sufficient living. But in fact this will not be possible unless they inhabit one and the same location and practice intermarriage. That is why marriage connections arose in cities, as well as brotherhoods, religious sacrifices, and the pastimes characteristic of living together. And things of this sort are the work of friendship; for the deliberate choice to live together is friendship. The end of the city is living well, then, but these other things are for the sake of the end. And the city is the community of families and villages in complete and self-sufficient living, which we say is living happily and nobly. **1281^{a}1**

So political communities must be counted as being for the sake of noble actions, not for the sake of living together. That is why those who contribute the most to this sort of community have a larger share in the city than those who are equal or superior in freedom or family but unequal in political virtue, and those who are superior in wealth but inferior in virtue.

That all those who dispute about constitutions, then, speak about a part of justice is evident from what has been said.

3.10
Control of the City

There is a puzzle as to which part is to be in control of the city. For surely it is either the majority, the rich, the decent people, the one who is best of all, or a tyrant. But all of these apparently involve difficulties. For what if the poor, because they are the majority, divide up the property of the rich—is this not unjust? "Well, by Zeus, it seemed just to the body in control." But what then is one to say the ultimate injustice is? Again, if the majority, having seized everything, divides up the property of the minority, it is evident that they are destroying the city. But surely virtue does not destroy what has it, nor is justice something capable of destroying a city. So it is clear that this law cannot be just. Further, [it would follow that] it is necessary for all the actions done by the tyrant to be just too; for he, being stronger, uses force, just as the majority do against the rich.

Then is it just for the minority and the rich to rule? If they act in the same way, plundering and confiscating the property of the majority, and this is just, then the other case is as well. It is evident, therefore, that all these things are bad and unjust.

Then should the decent people rule and have control of everything? In that case, everyone else will necessarily be deprived of honors, since they are denied the honors of holding political office; for offices are positions of honor, we say, and when the same people always rule, the rest will necessarily be deprived of honor.

Then is it better that the one who is most excellent should rule? But this is even more oligarchic; for those deprived of honors will be more numerous.

But perhaps someone might say that it is a bad thing in general for a human being rather than the law to be in control, since, at any rate, he has the feelings that arise in the soul. But if law is oligarchic or democratic, what difference will it make in the case of the puzzles that were raised? For the things we have described will happen all the same.

3.11
Majority Control?

As for the other cases, let them be the subject of some other account. But the view that the majority rather than those who are the best people, although few, should be in control would seem to be [one] to resolve[104] and to involve some puzzlement, but perhaps also some truth. For the many, each of whom individually is not an excellent man, nonetheless may, when they have come together, be better than the few best people, not individually but collectively, just as feasts to which many contribute are better than feasts provided at one person's expense; for, being many, each can have

104. Reading λύεσθαι.

some part of virtue and practical wisdom, and when they come together, the multitude is just like one human being, with many feet, many hands, and many perceptual modalities, and so too for their characters and thought. That is why the many are also better judges of works of music and of the poets; for distinct ones are better judges of distinct parts, and all of them are better judges of all the parts.

Indeed, it is in this respect that excellent men differ from each of the many, just as noble people are said to differ from those who are not noble, and the things in paintings produced by craft knowledge from real things, by bringing together what is scattered and separate into one—even though, if taken separately, at any rate, this person's eye and some other feature of someone else will be more noble than the painted ones.

Whether it is in the case of every people and every multitude that this superiority of the majority to the few excellent people can exist is not clear. Although, by Zeus, it presumably is clear that in some of them it cannot possibly do so. (For the same argument would apply to wild beasts; and yet what difference is there, one might ask, between some people and wild beasts?) But there is nothing to prevent what has been said from being true of some multitude.

That is why, by means of these considerations, one might also resolve the puzzle mentioned previously as well as the one connected to it, of what the free and the multitude of citizens—those who are not rich and have no claim whatever to virtue—should control. For to have them share in the most important offices is not safe (for, because of their injustice and foolishness, they would of necessity act unjustly in some instances and make errors in others). On the other hand, neither to give a share nor have a share is a fearful thing (for when there is a large number of people deprived of honors and poor, that city is necessarily full of enemies). The remaining alternative, then, is to have them share in deliberation and judgment. That is why Solon and some other legislators arrange to have them elect and inspect officials, but do not allow them to hold office individually. For when they all come together their perception is adequate, and, when mixed with their betters, they benefit their cities, just as a mixture of impure nourishment with the pure sort makes the whole thing more useful than a little [of the latter]. Taken separately, however, each of them is incomplete as regards judging.

But this order characteristic of the constitution itself raises puzzles. In the first place, it might seem that it belongs to the very same person to judge whether someone has treated a patient correctly, and to treat patients, that is, to cure them of their present disease—the doctor. And the same would also seem to hold in other areas of experience and other crafts. Hence, just as a doctor should be answerable to doctors, so others should also be answerable to their peers. A doctor, however, may be either an ordinary practitioner of the craft, an architectonic one, or thirdly, someone well educated in the craft (for there are people of this third sort in—one might almost say—all crafts). And we allow judgment to well-educated people no less than to those who know the craft.

It might seem, therefore, that election [of officials] is the same way. For choosing correctly is also a work of those who know the craft—for example, choosing a geometer is a work of geometers, and choosing a ship's captain of ship's captains. For even if, in the case of some works and crafts, certain private individuals also have a share in choosing, they do not have a greater share than those who know the craft. According to this argument, then, the multitude must not be put in control of the election or inspection of officials.

But presumably not all of these things are said correctly, both because of the argument just given, provided that the multitude is not too slavish (for each individually may be a worse judge than those who know the craft, but a better or no worse one when they all come together), and also because there are some crafts in which the maker might not be either the only or the best judge—the ones where those who lack the craft nonetheless know its products. For example, knowing about a house does not belong only to the maker—instead, the one who uses it is an even better judge (and the one who uses it is the household manager). A ship's captain too is a better judge of a rudder than a carpenter is, and a dinner guest, rather than the cook, a better judge of a feast. This puzzle, then, might seem to be adequately solved in this way.

There is another, however, connected with it. For it seems to be absurd for base people to control more important matters than decent ones do. But inspections and elections of officials are a most important thing. And in some constitutions, as was said, these are assigned to the people; for the assembly controls all such matters. And yet those who share in the assembly, in deliberation, and in judging are drawn from those with low property assessments (whatever their age), while the treasurers and generals and those who hold the most important offices are drawn from those with high property assessments.

But one can, then, also solve this puzzle in the same way. For presumably this way of doing things does seem to have something correct about it. For the official is neither the judge, nor the councilor, nor the assemblyman, but rather the court, the council, and the people, while each of the individuals mentioned (I mean the individual councilor, assemblyman, and judge) is only a part of these. So it is just for the majority to have control of the more important matters; for the people, the council, and the court consist of many individuals. Also, their collective property assessment is greater than the assessment of those who, whether individually or in small groups, hold the important offices. These matters, then, must be determined in this way.

1282b1 The first puzzle mentioned,[105] on the other hand, makes nothing else so evident as that the laws, when correctly laid down, should be in control, and that the ruler, whether one or many, should have control of only those matters on which the laws cannot pronounce with exactness, because it is not easy to make universal determinations concerning every case. But about what laws should be like if they are to be

105. 1281a35–39.

correctly laid down, nothing is yet clear. On the contrary, the puzzle stated previously[106] remains to be solved. For the laws must necessarily be base or excellent, just or unjust, at the same time and in the same way as the constitutions. Still, this at least is evident, that it is with a view to the constitution that the laws must be laid down. But if this is so, it is clear that laws that are in accord with correct constitutions must be just, and those in accord with deviant constitutions not just.

3.12
Justice, Equality, and Control

Since in every science and craft the end is a good, and the greatest and best good is the end of the one that has the most control of all, and this is the capacity of politics, and the just is the political good, and this is the common advantage, [one must, then, investigate what the just is]. It seems to everyone that the just is some sort of equality, and up to a point, at least, they agree with what has been determined in those philosophical accounts in which ethical matters were determined[107] (for justice is something to some people, and they say that it should be something equal to those who are equal). But what sort of equality and what sort of inequality—one should not overlook that. For it also involves a puzzle for political philosophy.

For perhaps someone might say that offices should be unequally distributed in accord with superiority in every good, provided people do not differ in their remaining qualities but happen to be similar, since for people who are superior something other [than an equal share] is just and in accord with worth. But if this is true, it will follow that those who excel in complexion, height, or any other good whatever should get more of what is distributed by political justice. And is this not obviously false? Manifestly, in the case of the other sciences and capacities, it is; for where pipe players are equally proficient in their craft, better pipes are not given to those who are more well-bred (for they will not play the pipe any better); rather, it is the one who is superior with respect to his work who is to be given the superior instruments. If what has been said is not yet clear, it will become still more evident if we take it further. For if someone is superior in pipe playing, but is very inferior in good breeding or beauty, then, even if each of these (I mean birth and beauty) is a greater good than pipe playing, and is proportionally more superior to pipe playing than he is superior in pipe playing, he must still be given the excellent pipes. For it is to the work of pipe playing that the superiority should contribute, and superiority in wealth and in good **1283^{a}1** breeding contribute nothing to it.

Further, according to this argument at any rate, every good would have to be comparable in contribution to every other. For if a certain height counted more in

106. 1281^{a}11–13.
107. *NE* 5.

competition, height in general would be in competition both with wealth and with freedom. So if this person is more superior to that one in height than that one is in virtue, and in general height is superior to virtue,[108] then all goods would be comparable. For if this much size is better than this much [virtue], it is clear that that much is equal to it. But, since this is impossible, it is clear that in the case of politics too it is reasonable not to dispute over political office in accord with every sort of inequality (for if some are slow runners and others fast, they should not have any more or any less a share of office because of this—but it is in athletic competitions that this sort of superiority wins honor). Rather, the sorts from which a city is composed are the ones in terms of which the dispute must be formulated. That is why it is reasonable for the well-bred, the free, and the rich to lay claim to the honor of office. For both those who are free and those who have assessed property are needed (for a city cannot consist entirely of poor people, any more than of slaves). But then if these things are needed in a city, it is clear that justice and political virtue are as well. For a city cannot be managed without these—except that without the former a city cannot exist, and without the latter it cannot be well managed.

3.13
The Just Basis for Control

With a view to the existence of a city, all or, at any rate, some of these qualities would seem to have a correct claim in the dispute. But with a view to good living, education and virtue would seem to have the most just claim of all in the dispute, as was also said previously.[109] But since those equal in one thing only should not have equality in everything, nor inequality either if they are unequal in only one thing, all constitutions of this sort are necessarily deviations.

It was said previously[110] that all dispute in a way justly, but that not all do so in an unconditionally just way. The rich have a claim because they own a larger share of the land, and the land is something communal, and further, because they are for the most part more trustworthy when it comes to treaties. The free and well-bred have a claim as being closely related to each other (for those who are more well-bred are more properly citizens than those who are ill-bred, and good breeding is esteemed at home by everyone). Further, they have a claim because the sons of better people are likely to be better, for good breeding is virtue of family. In the same way, then, we will say that virtue has a just claim in the dispute, for justice, we say, is a virtue relating to communities, which all the other virtues necessarily accompany. But then the majority also have a just claim against the minority, for in fact they are stronger, richer, and better, when taken as the majority in relation to the minority.

108. Reading πλεῖον ἀρετῆς μέγεθος ὅλως ὑπερέχειν.
109. 1281ᵃ1–8.
110. 1280ᵃ7–25.

If they were all to be present in a single city, therefore (I mean, for example, the good, the rich, the well-bred, and further, a political multitude distinct from them), **1283ᵇ1** will there be a dispute as to who should rule, or will there not? Within each of the constitutions mentioned, to be sure, the judgment as to who should rule is not disputed (for these differ from each other because of the ones who are in control—for 5 example, because in one the rich are in control, in another the excellent men, and each of the others differ the same way). Nonetheless, we are investigating how, when all these are present at the same time, the matter is to be determined. Suppose, then, that those who possessed virtue were altogether few in number—how should the 10 matter be settled? Should the fewness be investigated with a view to the work—to whether they are able to manage the city—or to whether there is a multitude of them large enough for there to be a city composed of them?

There is a certain puzzle that faces all who dispute over political office. For it could seem that those who claim that they deserve to rule because of their wealth have no 15 justice to their claim at all, and similarly those claiming to do so because of family; for it is clear that if someone were richer again than all the others, then, in accord with the same justice, this one person should rule all of them. Similarly, it is clear that someone who is superior when it comes to good breeding should rule those who dispute because of freedom. And the same thing will perhaps also occur in the case of 20 virtue in aristocracies; for if one single man were to be better than the others in the governing body, even though they are excellent men, then, in accord with the same justice, this man should be in control. If, then, the majority too should be in control because they are superior to the few, then, if one person or more than one—but fewer than the many—were superior to the others, these should be in control rather than 25 the majority.

All these considerations, then, seem to make it evident that none of the definitions in accord with which people claim that they themselves deserve to rule, while everyone else deserves to be ruled by them, is correct. And in fact even against those who claim that they deserve to have control of the governing body in accord with their virtue, and similarly against those who do so in accord with 30 wealth, majorities would have an argument of some justice; for nothing prevents a majority from being sometimes better and richer than the few, not as individuals but jointly.

That is why the puzzle that some people put forward and investigate can also be 35 dealt with in this way. For they raise a puzzle about whether a legislator who wishes to set up the most correct laws should legislate with a view to the advantage of the better citizens or that of the majority when the case just mentioned occurs. But what is correct must be taken to mean "in an equal way," and correct in an equal way is what holds with a view to the advantage of the whole city—that is, with a view to 40 the common advantage of the citizens. And a citizen commonly is someone who shares in ruling and in being ruled, and while in accord with each constitution he is someone different, in the best constitution he is the person who has the capacity, and **1284ᵃ1**

makes the deliberate choice, to rule and to be ruled with a view to the life that is in accord with virtue.

If, however, there is one person, or more than one (though not enough to fill up a city), who is so outstanding in extreme virtue that neither the virtue nor the political capacity of all the others is comparable to his (if there is only one) or theirs (if there are a number of them), then people of this sort can no longer be counted as a part of the city; for they would be treated unjustly if they were thought worthy of equal shares despite being so unequal in virtue and political capacity; for anyone of that sort would probably be like a god among human beings.

From this it is clear that legislation too must be concerned with those who are equals both in family and in capacity, and that for the other sort there is no law; for they themselves are law. For in fact anyone who attempted to legislate for them would be ridiculous. For they would presumably respond in the way Antisthenes tells us the lions did when the hares acted like popular leaders and demanded equality for everyone.

And that is why, due to the same cause, democratically governed cities introduce ostracism;[111] for of all cities these are held to pursue equality most, and so they used to ostracize those who seemed to be superior in power because of their wealth, their many friends, or any other sort of political strength, banishing them from the city for fixed periods of time. Also, the story goes that the Argonauts left Heracles behind due to this sort of cause; for the *Argo* refused to carry him along with the others because he greatly exceeded the other sailors. That is also why those who criticize tyranny and the advice of Periander to Thrasybulus must not be thought to be simply correct in their censure (for they say that Periander said nothing to the messenger who had been sent to him for advice, but rather leveled a field by taking away the ears of wheat that were superior in height, and when the messenger, who was ignorant of the cause of this, reported what happened, Thrasybulus understood that he was to do away with the superior men).

This practice is advantageous not only to tyrants, however, nor are tyrants the only ones who use it; instead, the same situation holds in the case of both oligarchies and democracies; for ostracism has the same capacity in its way as cutting the superior people down to size or sending them into exile. And the same thing is done with regard to cities and nations by those in control of power—for example, Athens with regard to the people of Samos, Chios, and Lesbos (for as soon as it had a firm grip on its rule, despite the agreements, it humbled them); and the king of the Persians often pruned back the Medes and Babylonians, as well as any others who had grown presumptuous because they had once ruled empires of their own.

1284b1

The problem is a universal one that concerns all constitutions, even the correct ones; for though the deviant constitutions, looking to the private good [of the rulers],

111. This form of banishment without loss of property or citizenship for ten (later five) years was introduced in Athens by Cleisthenes. See *Ath.* 22.1–8.

do what Periander advises, nonetheless those that look to the common good proceed in the same way. But this is also clear in the case of the various crafts and sciences; for no painter would allow the animal he was painting to have a foot that was out of proportion, not even if it were one of outstanding beauty, nor would a shipbuilder allow this in the case of the stern or any of the other parts of the ship, nor indeed would a chorus master allow someone to be a member of the chorus who had a louder and more beautiful voice than the entire chorus. And so, because of this, there is nothing to prevent monarchs from being in harmony with the city they rule when they do what Periander advises, provided that their own rule benefits their cities. That is why, as regards the generally agreed-upon sorts of superiority, there is a certain political justice to the argument in favor of ostracism.

It would be better, certainly, if the legislator from the start sets up the constitution so that it had no need for a remedy of this sort. But the next best path is to try to correct the constitution, should the need arise, with a corrective of this sort. This, though, is precisely what tended not to happen in cities; for people did not look to the advantage of their own constitutions, but used ostracisms in a factious way.

It is evident, then, that in each of the deviant constitutions ostracism is to the private advantage [of the rulers] and is just, but it is also evident, presumably, that it is not also unconditionally just. In the case of the best constitution, however, there is much puzzlement, not about superiority in other goods, such as power or wealth or having many friends, but about what must be done if there happens to be someone who is outstanding in virtue. For surely people would not say that someone of that sort should be expelled or banished—but then neither would they say that there should be rule over him; for that would be much the same as claiming that they deserved to rule over Zeus by dividing the offices. The remaining possibility, therefore, and it seems to be precisely the natural one, is for everyone to obey such a person gladly, so that those like him will be permanent kings in their cities.

3.14
Kinds of Kingship

It may perhaps be a good thing, after the arguments just discussed, to change to an investigation of kingship; for we say that it is one of the correct constitutions. But what must be investigated is whether it is advantageous for a city or territory that is going to be well managed to be under a kingship or not, but rather under some other constitution instead, or whether it is advantageous for some but not for others.

First, then, it must be determined whether there is one single kind of kingship or whether it exhibits differences. *This*, then, is easy to see, that it encompasses many **1285ª1** kinds, and that the mode of rule is not the same in all of them. For the one in the Spartan constitution, which seems to be most of all a kingship in accord with law, does not have control of everything, but it is only when the king leaves the territory

that he has leadership in military affairs. Further, matters relating to the gods are assigned to the kings.

This sort of kingship, then, is a sort of permanent autocratic generalship; for the king does not have control of life or death, except in a certain sort of kingship,[112] similar to that exercised in ancient times on military expeditions, by law of force. Homer makes this clear; for Agamemnon put up with being abused in the assemblies, but when they went out to fight he had control even over life or death; at any rate, he says:

> Anyone I find far from the battle . . .
> Will have no hope of escaping dogs and vultures,
> For I myself will put him to death.[113]

This, then, is one form of kingship, generalship for life. And of generalships for life some are in accord with family, while others are elective.

But there is another form of monarchy beyond this, such as kingships that exist among some barbarians. The powers all these have are much the same as those that tyrants have, but they are in accord with law and are hereditary. Because barbarians are by nature more slavish in their characters than Greeks, those in Asia being more so than those in Europe, they submit to rule of a master with no complaint. They are tyrannical, then, because of being of this sort. But they are stable because they are hereditary and in accord with law. And their bodyguards are kingly and not tyrannical due to the same cause. For it is the citizens who guard kings with their weapons, while a foreign contingent guards tyrants; for kings rule in accord with law and rule voluntary subjects, while the latter rule involuntary ones, so that the former have bodyguards drawn from the citizens, while the latter have bodyguards against the citizens.

These, then, are two forms of monarchy. But there is another, which is precisely the one that existed among the ancient Greeks, the ones they call "dictators." This, simply speaking, is an elected tyranny, which differs from barbarian kingship not by not being in accord with law but only by not being hereditary. Some holders of this office ruled for life, others for a defined period of time or for defined actions—for example, the Mytileneans once elected Pittacus to defend them against the exiles led by Antimenides and the poet Alcaeus. And Alcaeus makes it clear in one of his drinking songs that they did elect Pittacus tyrant; for he complains that "they set up baseborn Pittacus as tyrant of that gutless and ill-omened city, with great praise from the assembled throng."[114] These monarchies are and were tyrannical because of being like the rule of a master, but kingly because of being elective and over voluntary subjects.

112. Reading ἔν τινι βασιλείᾳ.
113. *Iliad* 2.391–393. The last line is not in our text of Homer.
114. Fr. 87 Diehl.

A fourth form of kingly monarchy, which existed in the heroic age, was over voluntary subjects, hereditary, and came about in accord with law. For because the first ones were benefactors of the multitude due to their knowledge of crafts or warfare, or because of bringing them together or providing them with land, they became kings over voluntary subjects, and their descendants inherited the office from them. They were in control of leadership in war and of those religious sacrifices which were not in the hands of priests. They also judged legal cases. Some of them did so under oath, and others not—the oath consisted in lifting up the scepter. In ancient times they ruled continuously over the affairs both of the city and of its territory and over foreign affairs. But later, when the kings themselves relinquished some of these things, and others were taken away by the mob, in various cities only the sacrifices were left to the kings, and even where there was a kingship still worthy of the name, they held leadership only in military affairs conducted beyond the frontiers.

There are, then, these forms of kingship, four in number. One belongs to the heroic age—this one was over voluntary subjects but for certain defined purposes, the king being general, judge, and in control of matters to do with the gods. The second is the barbarian—this is rule of a master, on the basis of family, in accord with law. The third is so-called dictatorship—which is elective tyranny. And fourth among them is Spartan kingship—this, simply speaking, is permanent generalship in accord with family. These, then, differ from each other in this way.

But there is a fifth form of kingship, when one person controls all matters, just as each nation and each city controls common matters. It is ordered on the model of household management. For just as household management is a sort of kingship of a household, so this kingship is household management of a city or a nation or several nations.

3.15
Kingship and Law

It is pretty much the case, then, that there are (one might almost say) just two forms of kingship that must be investigated, the last one and the Spartan; for most of the others lie in between these; for they control less than absolute kingship but more than Spartan kingship. So our investigation is pretty much about two questions: first, whether it is advantageous for cities to have a permanent general (whether chosen in accord with family or by turns), or not advantageous; second, whether it is advantageous for one person to control everything, or not advantageous. However, the **1286^{a}1** investigation of this sort of generalship looks to be of a form that belongs more to an investigation of laws than of constitutions (for it can come to exist in any constitution). So the first question may be set aside. But the remaining mode of kingship is a form of constitution. So one should get a theoretical grasp on it and go through the puzzles it involves.

The starting-point of the investigation is this, whether it is more advantageous to be ruled by the best man or by the best laws. Those who think it advantageous to be ruled by a king hold that laws speak only of the universal, and do not prescribe with a view to particular circumstances, so that it is foolish to rule in any craft in accord with what is written down. And so it is a good thing that in Egypt the doctors are allowed to change the treatment [prescribed by the manuals] after the fourth day—although, if they do so earlier, it is at their own risk. It is evident, therefore, that the best constitution is not one that is in accord with what is written down and laws, due to the same cause. But then, the rulers should possess the universal account as well. And something to which the element of feeling is wholly unattached is better than something in which it is innate. This element does not belong to the law, while every human soul necessarily possesses it. But presumably it should be said, to balance this, that a human being will deliberate better about particular cases. That it is, therefore, necessary for [the ruler] to be a legislator is clear, and for laws to be laid down, but for them not to be in control insofar as they deviate from what is best, although they should certainly be in control everywhere else.

As regards cases that the law cannot judge either at all or well, though, should the one best person rule, or everyone? For even as things stand, people come together to hear cases, deliberate, and judge, and the judgments themselves all concern particulars. Taken individually, any one of these people is presumably inferior [to the best person]. But a city consists of many people, just like a feast to which many contribute is better than one that is one and simple. That is why a mob can also judge many things better than any random individual.

Further, a large quantity is more incorruptible, like a larger quantity of water, and so the multitude are more incorruptible than the few. And while the judgment of an individual is necessarily corrupted when he is overcome by anger or some other passion of this sort, in the same situation it takes work to get all the citizens to become angry and make mistakes at the same time.

Suppose the multitude in question consists of the free, however, and that it does nothing outside the law, except as regards matters the law cannot cover. Granted, this is not an easy thing to arrange where numbers are large. But suppose there were a number who were both good men and good citizens: which would be more incorruptible, one ruler or a larger number all of whom were good? Isn't it clear that it would be the latter? "But such a group will split into factions, while the single person is free of factional conflict." One should, perhaps, oppose this objection by pointing out that they may be excellent in soul just like the single individual.

If, then, the rule of a number of people, all of whom are good men, is to be counted as an aristocracy, and the rule of one person as a kingship, aristocracy would be more choiceworthy for cities than kingship, both when the office involves capacity and when it is separate from capacity, provided that it is possible to find a number of people of similar quality. This is presumably also why people were formerly under

kingships, because it was rare to find men who were very superior in virtue, especially as the cities they lived in at that time were small.

Further, they made men kings as a consequence of benefits conferred, and conferring benefits is precisely what it is the work of good men to do [and good men were rare]. When, however, there began to be many people who were similar in virtue, they no longer put up with kingship, but looked for something common and put in place a [non-monarchical] constitution. But they grew worse when they began to acquire wealth from the communal funds, and it was from this, one might reasonably suppose, that oligarchies arose; for they made wealth an honored thing. Then from oligarchies they changed first into tyrannies, and from tyrannies to democracy; for by concentrating power into ever fewer hands because of a shameful desire for profit, they made the multitude stronger, with the result that it revolted and democracies arose. Now that cities have become even larger, it is presumably no longer easy for any other constitution to arise besides democracy.

If one does posit kingship as the best thing for a city, how is one to handle the matter of children? Is the family as such to rule as kings? But if they turn out as some have done, it would be harmful. "But in that case, even though he is in control, he will not give it to his children." But this is no longer easy to believe; for it would be a hard thing to do, and would demand greater virtue than is in accord with human nature.

There is also a puzzle about the king's power, as to whether anyone who is going to rule as king should have some force in attendance with which he can force anyone who does not wish to obey his rule. If not, how can he possibly manage his office? For even if he exercised control in accord with the law, and never acted in accord with his own wishes contrary to the law, nonetheless it would be necessary for him to have some power with which to guard the laws. In the case of this sort of king it is perhaps not difficult to determine the solution; for he should have a force, but a force so great as to be stronger than an individual, whether by himself or together with many, but weaker than the multitude. This is the way the ancients gave bodyguards when they appointed someone from the city to be what they called a "dictator" or "tyrant," and when Dionysius asked for bodyguards, someone advised the Syracusans to give him bodyguards of this sort.

3.16
Absolute Kingship

The account has now arrived at the king who does everything in accord with his own wish, and it is he that must be investigated. For the king, so-called, who rules **1287ᵃ1** in accord with law, is not, as we said,[115] a form of constitution (for a permanent

115. 1286ᵃ2–4.

generalship can exist in all of them, for example, in a democracy and an aristocracy, and many put one person in control of managing affairs—there is an office of this sort in Epidamnus, indeed, and to a lesser extent in Opus as well).

But as regards so-called absolute kingship (which is where the king rules everything in accord with his own wish), it seems to some people that it is not even natural for one person from among all the citizens to be in control, when the city consists of similar people; for, in accord with nature, justice and worth must be the same for those who are similar by nature. So if indeed it is harmful to their bodies for unequal people to have equal nourishment or clothing, the same also holds in the case of honors, and similarly, therefore, when equal people have inequality. That is why it is just for them to rule no more than they are ruled, and, therefore, to do so in turn. But this already involves law; for the order is law.

It is more choiceworthy, therefore, to have law rule than any one of the citizens. And, by this same argument, even if to have certain people rule is better, they must be appointed as guardians of the laws and assistants to them; for it is necessary for there to be some offices, although it is not just, they say, for there to be only one—at any rate, not when all are similar.

As for the things that the law seems unable to determine, they could not be known by a human being either. Rather, the law, having designedly educated the rulers for these eventualities, hands over the rest to be judged and managed by the ruler in accord with their most just consideration. Further, it allows itself to be rectified in any way that seems, on being put to the test, to be better than the existing laws.

The one who bids the law to rule, then, would seem to be bidding the god and the understanding alone to rule, while the one who bids a human being to do so adds on a wild beast as well; for appetite is a thing of that sort, and spirit distorts [the judgment of] rulers even when they are the best men. That is why law is understanding without desire.

And the comparison with the crafts, that it is bad to give medical treatment in accord with what is written down and more choiceworthy to rely on those who possess craft knowledge instead, would seem to invoke a false paradigm. For doctors never do anything contrary to [medical] reason because of friendship, but earn their pay by healing the sick. Those who hold political office, on the other hand, are accustomed to doing many things out of spite or gratitude. In fact, if people suspected their doctors of being persuaded by their enemies to do away with them because of a bribe, they would seek treatment derived from what is written down instead. Moreover, doctors themselves call in other doctors to treat them when they are sick, and
1287b1 coaches call in other coaches when they are exercising, on the supposition that they are unable to judge truly because they are judging about their own cases and under the influence of feelings. So it is clear that in seeking what is just they are seeking the mean; for the law is the mean.

Further, laws that are in accord with habits have more control and deal with things that have more control than do written laws, so that even if a human ruler is safer than written laws, he is not safer than those that are in accord with habit.

Moreover, it is certainly not easy for a single ruler to oversee many things. Therefore, there will need to be numerous officials appointed under him. So what difference is there between having them there right from the start and having one person appoint them in this way? Further, as was also said previously,[116] if it is indeed just for the excellent man to rule because he is better, well, two good ones are, at any rate, better than one. Hence the saying "When two go together . . . ," and Agamemnon's prayer, "May ten such counselors be mine."[117]

Even as things stand, however, the judgment of officials, such as judges, has control of some matters, those that the law cannot determine, since about those matters that it can determine, no one disputes that the law itself would rule and judge best. But since some matters can be covered by the laws, while others cannot, the latter cause people to raise and investigate the puzzle as to whether it is more choiceworthy for the best law to rule or the best man; for to legislate about matters that call for deliberation is impossible. The counterargument, therefore, is not that it is not necessary for a human being to judge matters of this sort, but that there should be not only one judge, but rather many.

For each official judges well if he has been well educated by the law. And it would presumably seem strange if someone, when judging with one pair of eyes, one pair of ears, and doing actions with one pair of feet and hands, could see better than many people with many pairs; for, even as things stand, monarchs provide themselves with many eyes, ears, hands, and feet; for they make into co-rulers those who are friendly to their rule and to themselves. If they are not friendly in this way, they will not do things in accord with the monarch's deliberate choice. But if they are friends of his and of his rule—well, a friend is someone equal and similar, so if he thinks they should rule, he must likewise think that those who are equal and similar to him should rule.

The arguments of those who dispute against kingship, then, are pretty much these.

3.17
Constitutions Suited to Different Peoples

But presumably these arguments hold in the case of some people, but do not hold in the case of others. For what is by nature both just and advantageous is one thing in the case of rule by a master, another in the case of kingship, and another in the case of rule by a politician. In the case of tyrannical rule, however, or of the other constitutions that are deviations, nothing is just or naturally advantageous; for they come about contrary to nature. But from what has been said, it is evident, at any rate, that in a case where people are similar and equal, it is neither advantageous nor just **1288ᵃ1**

116. 1286ᵇ3–5.
117. Homer, *Iliad* 2.372, 10.224.

for one person to be in control of all, regardless of whether there are no laws, and the king himself is law, or whether there are laws, or whether he and the laws are good, or he and the laws are not good, or even—except in a certain way—whether he is their superior in virtue. What that way is must now be stated—although it has in a way already been stated too.[118]

First, it must be determined what is suited to kingship, what to aristocracy, and what to polity. Suited to kingship, then, is a multitude of the sort that naturally yields a stock that is superior in the virtue appropriate to political leadership. Suited to aristocracy is a multitude that naturally yields a multitude[119] capable of being ruled, with the rule appropriate to free people, by those who are suited to leadership by their possession of the virtue required for the rule of a politician. And suited to polity is a multitude in which there naturally arises a multitude useful for war,[120] which is capable of ruling and being ruled, under a law that distributes the offices to the rich in accord with worth.

Whenever there happens to arise, then, either a whole family, or even some one individual from among the others, who is so superior that his virtue exceeds that of all the others, then it is just for this family to have the kingship and to control everything, and for this one individual to be king. For, as was said previously, this is not only in accord with the justice usually put forward by those who put in place polities, aristocracies, oligarchies, or again democracies (for they all claim to be worthy of rule in accord with superiority in something, though not superiority in the same sort of thing), but also in accord with what was said previously.[121] For it is surely not appropriate to kill or exile or ostracize an individual of this sort, nor to claim that he deserves to be ruled in turn; for it is not natural for the part to exceed the whole, but this is what has happened to the one who is at this extreme. So the only remaining option is to obey such a person and for him to have control not by turns but unconditionally.

Kingship, then, and its differences, and whether it is advantageous for cities or not, and if so, for which and in what way, may be determined in this way.

3.18
The Best Constitution

We say that there are three correct constitutions, and that of these the best must be the one managed by the best people. This is the sort of constitution in which there happens to be either one particular person or a whole family or a multitude that is superior in virtue to all the rest, and where the latter are capable of being ruled and

118. 1284[a]3–[b]35.
119. Reading πλῆθος.
120. Reading πλῆθος πολεμικὸν.
121. 1284[a]3–[b]34.

the former of ruling with a view to the most choiceworthy way of living. And in our first accounts[122] it was proved that the virtue of a man must be identical to that of a citizen of the best city. Hence it is evident that in the same way, and through the same things, as a man becomes excellent, one might set up a city that is ruled by an aristocracy or by a king, so that the education and habits that make a man excellent are pretty much the same as those that make him a political or kingly ruler. **1288^b1**

Since these matters have been determined, we must attempt to discuss the best constitution, the way it naturally arises and how it is put in place. {It is necessary, then, for anyone who is going [to do this] to make the appropriate investigation . . .}[123]

BOOK 4[124]

4.1
The Science of Politics

Among all the crafts and sciences that are not partly developed but that, having become complete, deal with some one kind, it belongs to a single one to get a theoretical grasp on what is fitting in the case of each kind. For example, what sort of training is fitting for what sort of body, what sort is best (for the best is necessarily fitting for the sort of body that is by nature most noble and most nobly equipped), and what one sort is fitting for most bodies (for this too is a work of athletic training). Further, if someone has an appetite neither for the [physical] state nor for the scientific knowledge appropriate for those involved in competition, it belongs no less to coaches and athletic trainers to provide this capacity too. And we see something similar occurring with regard to medicine, shipbuilding, clothing manufacture, and every other craft.

So it is clear that it belongs to the same science to get a theoretical grasp on what the best constitution is and what it would have to be like to be most of all in accord with our prayers, provided that no external impediments stand in its way.

Also, which constitution is fitting for which cities; for achieving the best constitution is presumably impossible for many of them, and so neither the unconditionally best constitution nor the one that is best in the underlying conditions should be neglected by the good legislator and true politician.

122. 3.4–5.

123. This incomplete sentence appears in a slightly different form as part of the opening sentence of Book 7.

124. The end of 3.18 prepares us for a discussion of the best constitution. Moreover, the opening of 4.2 suggests that such a discussion has already taken place, while Aristotle's own best constitution is not formally discussed until Books 7–8. For this reason some editors place these immediately following Book 3.

Further, the constitution based on a hypothesis; for it must be able to study how any given constitution might come into existence from the start, and in what way, once in existence, it might be preserved for the longest time. I mean, for example, when some city happens to be governed neither by the best constitution (not even having the necessary resources for it) nor by the best one possible in the existing circumstances, but by a worse one.

Besides all these things, the science should know which constitution is most fitting for all cities. And so most of those who have expressed views about constitutions, even if what they say is correct in other respects, certainly fail to give useful advice. For one should not get a theoretical grasp only on the best constitution, but also on the one that is possible, and similarly on the one that is easier and more attainable for all cities.

As things stand, however, some inquire only about the constitution that is highest and requires a lot of resources, while others, though they discuss a more commonly attainable constitution, do away with the actually existing constitutions and praise the Spartan or some other. But what must be done is to describe the sort of order that people will be easily persuaded to accept and be able to set in motion,[125] given what they already have, as it is no less work to reform a constitution than to establish one from the start, just as[126] it is no less work to unlearn something than to learn it at the start.

That is why, in addition to what has just been mentioned, a politician should also be able to help existing constitutions, as was also said previously.[127] But this is impossible if he does not know how many forms of constitutions there are. As things stand, however, some people think that there is just one sort of democracy and one of oligarchy. But this is not true. So one must not overlook the differences in each of the constitutions, how many they are and in how many ways they can be combined.

And it is [the work] of this same practical wisdom to see both which laws are best and which are fitting for each of the constitutions. For laws should be set up, and all do set them up, by looking to the constitutions and not the constitutions by looking to the laws. For a constitution is for cities the order of their offices, how they are distributed, what element is in control in the constitution, and what the end of each community is. But the separate laws, which are among the things that make clear what the constitution is, are those that the officials must rule by and guard against those who transgress. And so it is clear that a knowledge of the differences in each constitution and of their number[128] is also necessary for setting up laws; for the same laws cannot be advantageous to all oligarchies nor to all democracies—if indeed there are several sorts of them, and not only one sort of democracy or of oligarchy.

4.2
Deviant Constitutions and the Tasks of Book 4

In the initial methodical inquiry concerning constitutions, we distinguished[129] three correct ones (kingship, aristocracy, polity) and three deviations from them (tyranny from kingship, oligarchy from aristocracy, and democracy from polity). Aristocracy and kingship were also spoken about (for getting a theoretical grasp on the best constitution is the same as discussing these names; for each of them wishes to be set up in accord with virtue furnished with resources). Further, how aristocracy and kingship differ from each other, and when a constitution should be considered a kingship, was determined previously.[130] It remains to deal with the constitution that is called by the name shared in common by all constitutions,[131] and also with the others—oligarchy, democracy, and tyranny.

It is also evident which of these deviations is worst and which second worst. For the deviation from the first and most divine constitution must of necessity be the worst. But the kingship must either be in name only and not in fact or it must be due to the great superiority of the person ruling as king. So tyranny, because it is **1289b1** the worst, is furthest removed from being a constitution, oligarchy is second worst (for aristocracy is very far removed from this constitution), and democracy the most moderate.

An earlier thinker[132] has already expressed this same view, though he did not look to the same thing as us. For he judged that when all these constitutions are decent (for example, when an oligarchy is good, and also the others), democracy is the worst of them, but that when they are bad, it is the best. But we say that these constitutions are wholly in error, and that it is not correct to speak of one sort of oligarchy as better than another, but as less bad.

But making a judgment about this sort of issue may be set aside for the present. Instead, we must determine: First, how many differences there are in constitutions—if indeed there are several forms of democracy and oligarchy.

Next, which constitution is most attainable, and which most choiceworthy after the best constitution.

And if there is some other constitution that is ruled in the best way and is correctly composed, and at the same time fitting for most cities, what it is.

Next, which of the other constitutions is more choiceworthy for which people (for maybe democracy is more necessary than oligarchy for some, while for others the reverse holds).

129. 3.7.
130. 3.7, 3.17.
131. I.e., "polity (*politeia*)."
132. Plato, *Statesman* 302e–303b.

After these things, we must determine in what way someone who wishes to do so should put in place these constitutions—I mean, each form of democracy and again of oligarchy.

Finally, when we have gone as far as we can to give a concise account of each of these issues, we must attempt to go through the ways in which constitutions are destroyed and those in which they are preserved, both in general and in the case of each one separately, and through what causes these most naturally come about.

4.3
Why There Are Several Constitutions

The cause of there being several constitutions is that in every city the number of the parts is greater than one. For, in the first place, we see that all cities are composed of households, and next again that within this multitude there have to be some people who are rich, some who are poor, and some who are in the middle, and that of the rich and of the poor, the first lot possess hoplite weapons, while the second lot are without hoplite weapons. We also see that the people are part farming, part trading, and part unrefined. And among the notables there are differences both in their wealth and in the extent of their property—for example, in the breeding of horses (for this is not easy for those without wealth to do; that is why, indeed, there were oligarchies among those cities in ancient times whose power lay in their cavalry, and who used horses in wars with their neighbors—for example, the Eretrians, the Chalcidians, the Magnesians on the river Maeander, and many of the others in Asia). Further, in addition to differences in accord with wealth, there are differences in accord with breeding, in accord with virtue, and in accord with everything else of the sort that was
1290a1 said to be part of a city in our discussion of aristocracy;[133] for there we distinguished the number of parts that are necessary to any city; for sometimes all of these parts share in the constitution, sometimes fewer, sometimes more.

It is evident, therefore, that there must be several constitutions that differ in form from each other; for their parts themselves also differ in form. For a constitution in fact is an ordering of the offices, and all constitutions distribute these either in accord with the capacity of the participants, or in accord with some sort of equality common to them (I mean, for example, the capacity of the poor, or that of the rich, or some equality common to both). There must, therefore, be as many constitutions as there are orders that are in accord with the sorts of superiority and the differences of the parts.

But there seem to be two in particular, since just as in the case of the winds some are said to be northern, others southern, and the others deviations from these, so there seem to be two constitutions, democracy and oligarchy. For aristocracy is

133. Probably a reference to 1283a14–26, although the issue is also discussed in 7.7–9.

regarded as a sort of oligarchy, on the supposition that it is a sort of rule by the few, while a so-called polity is regarded as a sort of democracy, just as the west wind is regarded as northerly, and the east as southerly.[134] And something similar holds in the case of harmonies, so some people say; for there as well two forms are posited, the Dorian and the Phrygian, and the other modes are called either "Doric" or "Phrygic."

People are particularly accustomed, then, to think of constitutions in this way. But it is truer and better to distinguish them as we have, and say that two constitutions (or one) are correctly composed, and that the others are deviations from them, some from the well-mixed "harmony," and others from the best constitution, the more tightly controlled ones and those that are more like the rule of a master being more oligarchic, and the unrestrained and soft ones, democratic.

4.4
Democracy and Oligarchy

One should not regard democracy, in the way some people[135] are accustomed to do now, as simply being where the majority is in control (for both in oligarchies and everywhere else, the larger part is in control), nor an oligarchy as where the few control the constitution. For if the inhabitants totaled thirteen hundred, and a thousand were rich and gave no share in the honors of office to the three hundred poor, although these were free people and equal to the rich in all other respects, no one would say that they were democratically governed. Similarly, if the poor were few, but stronger than the rich, who were a majority, no one would call a constitution of this sort an "oligarchy" if the others, though rich, did not share in the offices. Therefore, one must rather say that a democracy is when the free are in control, and an oligarchy when the rich are in control. But it happens that the former are many **$1290^{b}1$** and the latter few; for many are free but few are rich. For otherwise there would be an oligarchy even if offices were distributed in accord with height (as is said to happen in Ethiopia) or in accord with noble stature; for people of noble stature and tall people are both few in number.

Yet it is not enough to define these constitutions by these things alone. Rather, since the parts both of democracy and of oligarchy are several, it must be grasped further that it is not a democracy if a few free people rule over a majority who are not free, as, for example, in Apollonia on the Ionian Gulf and in Thera (for in each of these cities the offices were held by those who were outstanding for their good breeding and had first taken possession of the colonies, although they were few among many), and that it is not a democracy[136] either if the rich rule because they are a majority, as was formerly the case in Colophon, where the majority possessed large

134. *Mete*. $364^{a}18–27$.
135. Plato, *Statesman* 291d.
136. Reading δῆμος.

properties before the war against the Lydians occurred.[137] Rather, it is a democracy when the free and poor, who are a majority, have the control of office, and an oligarchy when the rich and wellborn, who are few, do.

It has been stated, then, that there are several constitutions, and what the cause of this is. But let us now say why there are more than the ones mentioned, which ones they are, and due to what cause, taking as our starting-point what was stated previously.[138] For we agreed that no city has only one part but several.

If we wanted to grasp the forms of animal, we would first determine what precisely it is that every animal must have—for example, some of the perceptual organs, something capable of working on and absorbing nourishment, such as a mouth and a stomach, and in addition to these, parts by which each of them moves. If, then, there were only this many parts, but there were differences in them (I mean, for example, if there were several kinds of mouths, stomachs, and perceptual organs, and further, parts for movement too), then the number of ways of combining these will necessarily produce several kinds of animals (for the same animal cannot have many different sorts of mouth, nor of ears either). So, when all the possible ways of coupling them have been grasped, they will produce forms of animal, and as many forms of animal as there are combinations of the necessary parts. It is the same way with the constitutions mentioned. For cities in fact are composed not of one but of many parts, as has often been said.[139]

One of these parts is the multitude concerned with nourishment, the ones called "farmers." A second is the one called "unrefined." This is the one concerned with the crafts a city cannot be managed without—and of these, some are present of necessity, while others contribute to luxury or noble living. A third is the trading part (by which I mean the one concerned with selling and buying, retail trade and commerce). A fourth is that of hired laborers. A fifth is the kind that goes to war for the city, which is no less necessary than the others, if the inhabitants are not to become the slaves of any aggressor. For presumably it is impossible for any city that is by nature slavish to deserve to be called a "city"; for a city is self-sufficient, while a slavish thing is not self-sufficient.

That is why what is said in the *Republic*,[140] though sophisticated, is not adequate. For Socrates says that a city is composed of four most necessary parts, and these, he says, are a weaver, a farmer, a shoemaker, and a builder. Then, on the supposition that these are not self-sufficient, he adds a blacksmith, people to look after the necessary livestock, and further, both someone engaged in retail trade and someone engaged in commerce. All these become the full complement of his first city—as if every city were composed for the sake of providing the necessities, not rather for the sake of what is noble, and had equal need of both shoemakers and farmers. Nor does he

138. 1289b27.
139. 1274b38–40, 1283a14–17, 1289b27–28, 1290b23–24.
140. 369d–371e.

assign it a part that goes to war for the city until, its territory being expanded and encroaching on that of their neighbors, they become involved in war.

Yet even in these communities of four (or however many) parts, there must be the one making assignments and rendering judgment about what is just. So, if indeed one should regard soul as more a part of an animal than body, then, in the case of cities too, things of the following sort are to be counted as parts rather than those directed to the satisfaction of necessary needs: the part concerned with war, the part that participates in administering judicial justice, and in addition to these the part that deliberates, deliberation being precisely a work of political comprehension. (It makes no difference to the argument whether these works belong to separate people or the same ones; for in fact it often happens that the same people both serve as hoplites and do the farming. So, if indeed both the former and the latter are to be regarded as parts of the city, it is certainly evident that the hoplite element must be a part of the city.)

Seventh is the part that performs public service by means of its property, the one we call "the rich."

Eighth is the part that renders public service, that is, holds the various offices, if indeed without officials a city cannot exist. There must, then, be some people who are able to rule and render public service for the city either continuously or in turn.

There remains the one we happened to distinguish just now, the part that deliberates and renders judgment about the claims of people involved in disputes. If indeed these things must take place in cities, then, and do so in a way that is noble and just, there must also be some people who share in the virtue of politicians.[141] **1291b1**

As for the other capacities, many hold that they can belong to the same people—for example, that it is possible for the same people to be the ones who go to war for the city and to be farmers and craftsmen, and to be both deliberators and judges besides. And everyone claims to possess the relevant virtue too, and thinks he is capable of ruling in most of the offices. But for the same people to be both rich and poor is impossible. That is why these in particular, the rich and the poor, seem to be parts of a city. Further, because the former are for the most part few in number and the latter many, it appears that of the parts of a city these two are contraries. So constitutions are put in place in accord with the sorts of superiority belonging to these, and there seem to be two constitutions, democracy and oligarchy.

That there are a number of constitutions, and what the causes of this are, was stated previously.[142] But that there are also several forms of democracy and of oligarchy, we say. This is in fact evident from what has been said. For there are several forms both of the people and of the so-called notables. For example, of the people, one form is the farmers and another that concerned with the crafts, another is the part involved in trade, which is engaged in buying and selling, another the part concerned with

141. Reading πολιτικῶν.
142. 1289b27–28.

the sea—of which part is navy, part is engaged in the craft of wealth acquisition, part in ferrying passengers, and part in fishing. (For in many places a particular one of these amounts to a large mob of people—for example, fishermen in Tarentum and Byzantium, navy men in Athens, traders in Aegina and Chios, and ferrymen in Tenedos.) In addition to these, there is the part involved in manual labor and that has little property, so that it is not able to be at leisure. Further, the part consisting of those who are free but not of citizen parentage on both sides, and whatever other similar form of multitude there may be. Among the notables, there are ones distinguished by wealth, good breeding, virtue, education, and the other characteristics that are said [of things] in accord with the same sort of difference as these.

The first sort of democracy, then, is the one that is said to be above all in accord with equality. For the law in a democracy of this sort says that there is equality when the poor enjoy no more superiority than the rich, and when neither is in control but both are similar. For if indeed freedom exists above all in a democracy, as some people suppose,[143] and equality too, then this would be particularly the case when everyone shares, as much as possible, in the constitution in a similar way. But since the people are a majority, and the belief of the majority is in control, this constitution must be a democracy. This, then, is one form of democracy.

Another is where offices are filled on the basis of property assessments, but these are low, and where anyone who acquires the assessed amount may share [in the constitution], while anyone who loses it may not.

1292a1 Another form of democracy is where all the uncontested citizens share, and the law rules.

Another form of democracy is where everyone shares in office merely by being a citizen, and the law rules.

Another form of democracy is the same in other respects, but the multitude has control, not the law. This arises when decrees are in control instead of laws; and this happens because of popular leaders. For in cities under democracies that are in accord with law, popular leaders do not arise, but rather it is the best of the citizens who take the front seats. Where the laws are not in control, however, there popular leaders arise. For the people become a monarch, one monarch composed of many people; for the many are in control not as individuals but all together.

When Homer says "to have many rulers is not good,"[144] it is not clear whether he means this sort of rule, or the sort where there are a number of individual rulers. In any case, a people of this sort, because it is a monarchy, seeks to exercise monarchic rule, because of not being ruled by the law, and becomes a master. As a result flatterers are held in esteem and a democracy of this sort is the analog of tyranny among the monarchies. That is why indeed their characters are the same, in that both act like masters toward the better people, the decrees of the one are like the edicts of the

143. Plato, *Republic* 557a–c, 562b–563d.
144. *Iliad* 2.204.

other, and a popular leader and a flatterer are the same or analogous. And each of these exercises great power with each, flatterers with tyrants, popular leaders with peoples of this sort. And it is these popular leaders who, by bringing everything before the people, are responsible for decrees being in control rather than the laws; for they become great because the people are in control of everything, and also because they are in control of the belief of the people; for the majority are persuaded by them. Further, those who make accusations against officials say that the people should judge. The suggestion is gladly accepted by the people, with the result that all the offices are destroyed.

But it might seem reasonable to object that this sort of democracy is not a constitution at all, on the grounds that where the laws do not rule there is no constitution. For the law should rule everything,[145] while in the case of particulars the officials and the constitution should render judgment.[146] So if indeed democracy is one of the constitutions, it is evident that this state of affairs, in which everything is managed by decree, is not even a democracy in the strict sense; for no decree can possibly be universal.

The forms of democracy, then, should be distinguished in this way.

4.5
Forms of Oligarchy

Among the various forms of oligarchy, one is where offices are filled on the basis of such a high property assessment that the poor do not share in the constitution, even though they are a majority, but where anyone who does acquire the assessed amount may share in it.

Another is where the offices are filled on the basis of a large assessment, and the officials themselves elect those who will fill any vacancy. If they elect from among all of these, it seems more aristocratic, if from some specified group, oligarchic.

Another form of oligarchy is where a son succeeds his father.

A fourth is where what was just mentioned occurs, and not the law but the officials rule. This is the counterpart among the oligarchies of tyranny among the monarchies, and of the democracy we spoke of last among the democracies; and an oligarchy of this sort they call a "dynasty."

There are, then, these many forms of oligarchy and democracy. But one must not overlook the fact that in many places it has happened that though the constitution that is in accord with the law is not democratic, because of custom and direction they are governed democratically. Similarly, it is the reverse in other places—the constitution that is in accord with the laws is more democratic but, because of custom

145. Rejecting the addition of τῶν καθόλου.
146. Reading τὴν πολιτείαν κρίνειν.

and direction, they are governed in a more oligarchic way. This happens especially after there have been constitutional changes; for the change is not immediate, but they are content at first to get more than the others in small ways. So the laws that existed before remain in effect, but it is those who have changed the constitution who exercise the power.

4.6
Forms of Democracy and Oligarchy

It is evident from what has been said that there are this many forms of democracy and oligarchy. For either all of the mentioned parts of the people must share in the constitution, or some must and others not

When, then, the part that farms and that owns a moderate amount of property has control of the constitution, it is governed in accord with laws (for they have enough to live on as long as they keep working, but they cannot afford to be at leisure, so they put the law in charge and hold only such assemblies as are necessary). As for the other part, it is open to them to share when they have acquired the property assessment defined by the laws. That is why it is open to all those who have acquired it to share; for, generally speaking, it is oligarchic when it is not open for all to share—but, then, for it to be open to them to be at leisure is impossible in the absence of revenues.[147] This, then, is one form of democracy and these are the causes of it.

Another form arises because of the following distinction; for it may be possible for everyone of uncontested family descent to share, but for only those who have the leisure to actually do so. That is why, indeed, in this sort of democracy the laws rule, because there is no revenue.

A third form is when all who are free may share in the constitution, but, due to the cause just mentioned, they do not share, so that the law necessarily rules in this sort too.

1293a1 A fourth form of democracy was the last to arise in cities. For because of cities having become much larger than the original ones and having abundant sources of revenue, everyone shares in the constitution, because of the superiority of the multitude. And all do share and govern, because even the poor are able to be at leisure, since they get paid. A multitude of this sort is especially at leisure; for care of their own property does not impede them at all. But it does impede the rich, so that they often do not take part in the assembly or serve on juries. That is why the constitution comes to be controlled by the multitude of poor citizens, instead of by the laws.

The forms of democracy, then, are such and so many because of these necessities. And here are those of oligarchy:

147. Reading τὸ . . . οὐσῶν.

When a larger number of people own property, though not an excessive amount, this is the first form of oligarchy; for anyone who acquires the amount may share, and because of the multitude of people sharing in the governing body, law is necessarily in control, not human beings; for the more removed they are from monarchy, having neither so much property that they can be at leisure without worrying nor so little that they need to be supported by the city, the more they necessarily think that the law deserves to rule them, not themselves.

But if those who own property are fewer and their properties greater than those mentioned before, the second sort of oligarchy arises; for, being stronger, they claim that they deserve to get more. That is why they themselves elect from among the rest of the citizens those who are to enter the governing body. But as they are not yet strong enough to rule without law, they pass a law to this effect.

But if they tighten it by becoming fewer and owning larger properties, the third stage of oligarchy is reached, where they keep the offices in their own hands, but do so in accord with a law requiring deceased members to be succeeded by their sons.

But when they now tighten it excessively by their property holdings and the number of their friends, a dynasty of this sort comes close to being a monarchy, and human beings are in control, not the law. This is the fourth form of oligarchy, a counterpart of the final one of democracy.

4.7
Forms of Aristocracy

There are also two constitutions besides democracy and oligarchy, one of which is mentioned by everyone and is said to be one of the four forms of constitutions. The four they mention are monarchy, oligarchy, democracy, and, fourth, so-called aristocracy. There is a fifth, however, which is referred to by the name shared by all constitutions, the one called *politeia* ("polity"). But because it does not occur often, it gets overlooked by those who try to enumerate the forms of constitutions, and, like Plato,[148] list only the four in their discussion of constitutions. **1293b1**

It is correct, then, to call the constitution we went through in our first accounts[149] an "aristocracy" (for the one consisting of those who are unconditionally best in accord with virtue, and not those who are good men relative to a hypothesis, is the only constitution that it is just to call an "aristocracy"; for only in it is the same person unconditionally a good man and a good citizen, while those who are good citizens in the others are so relative to their constitutions).

Nonetheless, there are some constitutions that are called "aristocracies" that exhibit differences both in relation to oligarchically governed constitutions and in

148. *Republic* 8–9.
149. 1276b34–1277a1, 1278a17–21, 1278b1–5, 1286b3–7, 1288a37–b2.

relation to a so-called polity. For wherever officials are elected not only on the basis of wealth but also on the basis of merit, the constitution itself differs from both of these and is called "aristocratic." For even in those constitutions where virtue is not a concern of the community, there are still some who are held in high repute and believed to be decent.

Wherever, then, a constitution looks to wealth, virtue, and the people (as it does in Carthage[150]) it is aristocratic, as also are those, like the Spartan constitution, which look to only two, virtue and the people, and where there is a mixture of these two things, democracy and virtue.[151] There are, then, these two forms of aristocracy besides the first, which is the best constitution; and there is also a third, those that lean more than so-called polity toward oligarchy.

4.8
Polity (1)

It remains for us to speak about so-called polity and about tyranny. We have ordered things in this way, even though neither polity nor the aristocracies just mentioned are deviations, because in truth they all fall short of the most correct constitution, and so are counted among the deviations, and these deviations that we mentioned at the start of our discussions[152] are deviations from them [that is, from polity and aristocracy]. On the other hand, it is reasonable to treat tyranny last, because it is least of all a constitution, and our methodical inquiry is concerned with constitutions.

The cause, then, of our ordering things in this way has been stated; we must now explain about polity. For its capacity should be more evident since we have determined matters concerning oligarchy and democracy. For polity, simply speaking, is a mixture of oligarchy and democracy. But it is customary to call those mixtures that lean toward democracy "polities," and to call "aristocracies" those that lean more toward oligarchy, because education and good breeding more commonly accompany those who are richer.

Further, the rich seem to possess already the things for the sake of which unjust people do injustice, which is why the rich are called both "noble and good" and "notable." Since, then, aristocracies wish to give superiority to the best of the citizens, oligarchies too are said to consist primarily of noble and good men. And it seems to be impossible for a city to be in good legislative order if it is not governed aristocratically, but rather by wicked people, and equally impossible for one that is not in good legislative order to be governed aristocratically. But good legislative order is not having the well laid-down laws that are not obeyed. That is why one must take one sort of good legislative order to be when the laws that are laid down are obeyed,

150. 1273a21–b1
151. 1270b15–17, b25, 1271b2–3.
152. 1289a26–b5, also 1279b4–6.

and another to be when the laws that are in fact obeyed are well laid down (for there is also obedience to badly laid-down laws). The latter can come about in two ways; for people may either obey the best laws possible for them, or the unconditionally best ones.

Aristocracy seems above all to exist when offices are distributed in accord with virtue (for virtue is the defining mark of aristocracy, wealth of oligarchy, and freedom of democracy). But [control] by the belief of the majority is found in all of them; for in oligarchy, aristocracy, and in democracies, the belief of the major part of those who share in the constitution is what is in control.

In most cities the form of constitution is badly named; for the mixture aims only at the rich and the poor, at wealth and freedom; for among pretty much the majority of people the rich seem to occupy the place of noble and good men. But since there are three grounds for claiming equality in the constitution, freedom, wealth, and virtue (for the fourth, which they call "good breeding," is a consequence of two of the others; for good breeding is a combination of old money and virtue), it is evident that the mixture of the two, the rich and the poor, must be called a "polity," while a mixture of the three should most of all the others must be called an "aristocracy," except for the true and first one.

That there are other forms of constitutions besides monarchy, democracy, and oligarchy, then, and what they are, has been stated, also how aristocracies differ among themselves, and polities from aristocracy, and that they are not far apart from each other is evident.

4.9
Polity (2)

Besides democracy and oligarchy, we should—in continuity with what was said[153]—now discuss in what way a so-called polity arises, and how it should be put in place. And at the same time it will be clear what things define democracy and oligarchy; for one must get hold of the division of these things, and then make a composite out of them, taking, as it were, a token from each.

There are three defining marks of this composition and mixture: One is to take the legislation of both constitutions. For example, in the case of the administration of justice, oligarchies impose a fine on the rich if they do not serve on juries, but provide no payment for the poor, while democracies pay the poor but do not fine the rich. Common to both constitutions, and a mean between them, is doing both. That is why this is characteristic of a polity, for it is a mixture of both. This, then, is one way to couple them. **1294b1**

153. 1293b22–30.

Another is to take the mean between the orders characteristic of each. For example, in democracies membership in the assembly is either not based on a property assessment at all or on an altogether small one, while in oligarchies it is based on a large property assessment. Common here is doing neither, but rather the assessment that is in a mean between the two of them.

A third is to take things from both orders, some from oligarchic law and others from democratic law. I mean, for example, that it seems to be democratic for officials to be chosen by lot, oligarchic by election; democratic not on the basis of a property assessment, oligarchic on such a basis. It is aristocratic, therefore, and characteristic of a polity, to take one element from one and another from the other—from oligarchy, by making the officials elected, from democracy, by doing so not on the basis of a property assessment.

This, then, is the way to mix them. But the defining mark of a good mixture of democracy and oligarchy is when it is possible to say of the same constitution that it is both a democracy and an oligarchy. For it is clear that speakers speak of it in this way because the mixture is a good one. The mean too is like this, for each of the extremes is evident in it, which is precisely how things are in the case of the Spartan constitution.

For many people attempt to speak of it as a democracy, because it has many democratic elements in its order. In the first place, for example, there is the way sons are brought up (for those of the rich are brought up like those of the poor, and are educated in the way that the sons of the poor could be too). Similarly, at the next age, when they have become men, it is the same way (for it is not entirely clear who is rich and who is poor). The nourishment at the communal messes is the same for everyone, and the rich wear clothes that any poor person could also provide for himself. Further, of the two most important offices, the people elect candidates to one and share in the other (for they elect the senators and share in the overseership).

Other people, however, call the Spartan constitution an "oligarchy" because of its having many oligarchic elements. For example, all the officials are elected and none chosen by lot, a few have control to impose death and exile, and there are also many other elements of this sort. In a constitution that is well mixed, by contrast, both elements should seem to be present, and also neither, and it should be preserved because of itself and not because of external factors, and because of itself not because a majority wishes it (for that could happen in a wicked constitution too), but because none of the parts of the city as a whole would even wish for another constitution.

In what way a polity should be put in place, and likewise those constitutions that are termed aristocracies, has now been stated.

4.10
Forms of Tyranny

It remains for us to speak about tyranny, not because there is much argument about it, but so that it can take its place in our methodical inquiry, since we assign to it too a place among the constitutions. **1295a1**

We discussed kingship in our first accounts,[154] where we made an investigation into whether what is most of all called a "kingship" is disadvantageous for cities or advantageous, who should be appointed "king," from where, and in what way. And we distinguished two forms of tyranny while we were making our investigation of kingship, because their power in a way also overlaps with kingship, because both of these sorts of rule are in accord with law (for among some barbarian peoples they choose autocratic monarchs, and in former times among the ancient Greeks there were people who became monarchs in this way, the ones called "dictators"). There are certain differences between these. But both were kingly, because they were in accord with law and involved monarchical rule over voluntary subjects, and both were tyrannical, because the monarchs ruled like masters in accord with their own judgment.

There is a third form of tyranny, which is the very one that seems most of all to be a tyranny, because it is a counterpart of absolute kingship. And any monarchy is necessarily a tyranny of this sort if the monarch rules in a non-accountable way over people who are his equals or betters, with a view to his own advantage, not that of the ruled. That is precisely why it is involuntary; for no free person voluntarily puts up with rule of this sort.

The forms of tyranny are these and this many, then, due to the causes that were mentioned.

4.11
The Middle Class (1)

What is the best constitution, and what is the best life for most cities and most human beings, comparing it neither to a virtue that is beyond the reach of private individuals, nor to an education that requires natural gifts and resources that depend on luck, nor to the constitution that is in accord with our prayers, but to a life that most people can share and a constitution in which most cities can share? For the constitutions called "aristocracies," which we spoke about just now, either fall outside the reach of most cities or border on so-called polities—which is why the two must be spoken about as one.

154. 3.14–17.

But now the judgment about all these matters depends on the same elements. For if what was said in the *Ethics*[155] is correct, and a happy life is the unimpeded life that is in accord with virtue, and virtue is a mean [or middle] state, then it is necessary for the middle life to be best, the one that admits of being aimed at by each sort of person. These same defining marks must also define the virtue and vice of both a city and a constitution; for the constitution is a sort of life of a city.

1295b1 In all cities, then, there are three things that are parts of the city: the very rich, the very poor, and third those who are in the middle between these. Therefore, since it is agreed that the moderate and the middle is best, it is evident that possessing a middling amount of the goods of luck is also best of all. For that makes it easiest to obey reason, while whatever is hyper noble, hyper strong, hyper well-bred or hyper rich, or the contraries of these, hyper poor, hyper weak, or exceedingly without honor, makes it difficult to obey reason; for the first lot tend more toward committing wanton aggression and major vice, while the second lot tend too much to become doers of evil and petty wickedness. And injustices are caused in the one case by wanton aggression and in the other by evildoing. Further, those in the middle are least inclined either to avoid rule or to be eager to rule, both of which things are harmful to cities.

In addition, those who are superior in the goods of luck (strength, wealth, friends, and other things of that sort) neither wish to be ruled nor know how to be ruled. And this characteristic they acquire right from the start at home while they are still children; for because of their luxurious living they are not accustomed to being ruled even in school. Those, on the other hand, who are excessively deprived of goods of this sort are too humble. So the latter do not have the scientific knowledge of how to rule, but only how to be ruled in the way slaves are ruled, while the former do not have it of how to be ruled in any way, but only how to rule with the rule of a master.

What comes into being, then, is a city consisting of slaves and masters, but not of free people, the one group envious, the other contemptuous—which is the furthest thing from political friendship and political community; for community is fitted to friendship; for enemies do not wish to share even a road in common. But a city tends, at any rate, to consist as much as possible of people who are equal and similar, and this especially holds of those in the middle. So it is necessary for this city—the one that is composed of those we say a city is by nature composed of—to be governed in the best way.

Also, of all the citizens, those in the middle are the ones that preserve themselves most in cities. For they neither desire other people's property, as the poor do, nor do other people desire theirs, as the poor desire that of the rich. And because they are neither plotted against nor plot, they pass their time free from danger. That is why Phocylides did well to pray: "Many things are best for those in the middle. In the middle is where I want to be in a city."[156]

155. E.g., *NE* 1101a14–16.
156. Fr. 10 Diehl.

It is clear, therefore, that the political community that is due to those in the middle is best too, and that cities can be well governed where the middle class is numerous and stronger—especially if it is stronger than both of the others, or, failing that, than one of them; for it will tip the balance when added to either and prevent opposing excesses from arising. That is why it is the height of good luck if those in the governing body own a middling and adequate amount of property, because when some people own an excessive amount and the rest own nothing, either extreme democracy arises or unmixed oligarchy or—as a result of both excesses—tyranny; for in fact tyranny arises from the most vigorous sort of democracy and from [unmixed] oligarchy, but much less often from middle constitutions or those close to them. We will state the cause of this later on when we speak about constitutional changes.[157]

It is evident that the middle constitution is best, then; for it alone is free from factional conflict; for where there are many people in the middle, factions and disagreements least occur among the citizens. And large cities are freer from factional conflict due to the same cause, that the middle class is numerous. In small cities, on the other hand, it is easy to divide all the citizens into two, so that no middle class is left and pretty much everyone is either poor or rich. And democracies are more stable and longer lasting than oligarchies because of those in the middle (for they are more numerous in democracies than oligarchies and share in office more), since when, without these, the poor are predominant in number, failure occurs and things are quickly ruined. It should be regarded as a sign of this that the best legislators have come from the middle citizens; for Solon was one of these, as is clear from his poems, as were Lycurgus (for he was not a king), Charondas, and pretty much most of the others.

It is also evident from these considerations why most constitutions are either democratic or oligarchic. For because the middle class in them is often small, whichever of the others is superior—whether the property owners or the people—distances itself from the middle class and conducts the constitution to suit itself, so that either a democracy comes about or an oligarchy.

In addition to this, because of the factions and fights that occur between the people and the rich, whenever one side or the other happens to be stronger than its opponents, they put in place neither a communal constitution nor an equal one, but take their superiority in the constitution as a reward of their victory and make in the one case a democracy and in the other an oligarchy.

Further, those who achieved leadership in Greece[158] have looked to their own constitutions and put in place either democracies or oligarchies in cities, targeting not the advantage of the cities but their own, so that, because of this, the middle constitution has either never come about or has done so rarely and in few places; for

157. 1308ᵃ20–24, 1310ᵇ3–7, 1312ᵇ34–38.
158. Athens and Sparta.

one man alone,[159] among those who have previously held positions of leadership, has ever allowed himself to be persuaded to introduce this sort of order, and it has now become customary for those in cities not even to wish for equality, but either to seek rule or to put up with being dominated.

What the best constitution is, then, and why it is so, is evident from these considerations. As for the other constitutions (for there are, we say, several sorts of democracies and of oligarchies), which of them is to be counted as first, which as second, and so on in the very same way, in accord with whether it is better or worse, is not difficult to see now that the best has been determined. For the one nearest to this is of necessity always better and one further from the middle constitution worse—provided one is not judging relative to a hypothesis. I say "relative to a hypothesis," because it often happens that, while one constitution is more choiceworthy, nothing prevents a different one from being more advantageous for some [cities].

4.12
The Middle Class (2)

What constitution is advantageous for what [city], and what sort of constitution for what sort of city, is the next thing to go through after what has been said. First, though, a general point must be grasped about all of them, that the part of a city that wishes the constitution to endure must be stronger than the part that does not. But every city is made up of both quality and quantity. By "quality" I mean freedom, wealth, education, and good breeding; by "quantity" I mean superiority in numbers. But it is possible that the quality belongs to one of the parts of which a city is composed, while the quantity belongs to another. For example, the ill-bred may be more numerous than the wellborn or the poor more numerous than the rich, but yet the one may not be as superior in quantity as it is inferior in quality. That is why these have to be judged in relation to each other.

Where the multitude of poor people is superior in the proportion mentioned, it is natural for a democracy to exist, with each form of democracy corresponding to the superiority of each [form of] the people. For example, if the multitude of farmers is predominant, it will be the first sort of democracy, if the unrefined ones and wage earners are, the last sort, and similarly for the others in between these. But where the multitude of those who are rich and notable is more superior in quality than it is inferior in quantity, there an oligarchy [is natural], with each sort of oligarchy corresponding in the same way to the superiority of the multitude of oligarchs.

The legislator, however, should always add on those in the middle in his constitution; for if he is setting up oligarchic laws, he should aim at those in the middle, and if democratic ones, he must draw in those in the middle by these laws. And where

159. Identity unclear.

the multitude of those in the middle predominates either over both of the extremes together, or even only over one of them, it is possible to have a constitution that is steadfast. For there is no fear that the rich and the poor will ever conspire together against these; for neither will ever want to serve as slaves to the other, while if they look for a constitution that is more communal, they will find none other than this one. For they would not put up with ruling in turn, because they distrust each other. Everywhere an arbitrator is most trusted, and the middling person is an arbitrator.

The better mixed a constitution is, the more steadfast it is. But many of those who wish to produce aristocratic constitutions make the mistake not only of granting more to the rich, but also of deceiving the people. For sooner or later, false goods necessarily give rise to a true evil; for the attempts of the rich to get more destroy the constitution much more than those of the people do.

4.13
Subtle Devices Used in Constitutions

The subtleties devised in constitutions as pretexts to deceive the people are five in number, and concern the assembly, the offices, the courts, the possession of weapons, and athletic training. As regards the assembly: allowing all citizens to attend assemblies, but imposing a fine on the rich for not attending, either only on them or a much heavier one on them. As regards offices: not allowing those with an assessed amount of property to be excused under oath, but allowing the poor to be excused. As regards the courts: fining the rich for not serving on juries, but allowing the poor not to do so, or else imposing a large fine on the former and a small one on the latter—as in the laws of Charondas.[160] In some places, everyone who has registered may attend the assembly and serve on juries, but once they have registered, if they do not attend or serve, heavy fines are imposed on them. The aim is to get people to avoid registering because of the fine, and not to serve or attend because of not being registered. They legislate in the same way about possessing weapons and athletic training. For the poor are permitted not to possess weapons, but the rich are fined if they do not, and if they do not train, there is no fine for the former, but the latter are fined. That way the rich will share because of the fine, while the poor, not being in danger of it, will not share.

These subtle devices of legislation are oligarchic. In democracies, by contrast, there are subtleties devised that are contrary to these. For while the poor are paid to attend the assembly and serve on juries, the rich are not fined at all [for failing to]. So it is evident that if one wishes to have a just mixture, one must combine elements from both sides, and pay the poor while fining the rich; for in this way everyone would share, while in the other way the constitution comes to be in the hands of one side only.

160. $1274^{b}5$–8.

1297b1 A polity should, however, be composed only of those who possess weapons. But it is impossible to define the size of the relevant property assessment unconditionally, and say that it must be so-and-so much. We should instead look for what sort of amount[161] is the largest that would let those who share in the constitution outnumber those who do not, and fix on that. For the poor are willing to keep quiet even when they do not share in office, provided no one treats them with wanton aggression or takes away any of their property—but this is not easy to do; for those who do share in the governing body are not always refined people. And people are in the habit of shirking in time of war if they do not receive provisions and are poor—although if nourishment is provided, they wish to fight.

In some places, the polity consists not only of those who are serving as hoplites but also of those who have so served in the past. In Malia, the constitution consisted of both, although the officials were elected from among the active soldiers. Also, the first constitution that came about among the Greeks after the kingships consisted of the warriors. At the start, it consisted of the cavalrymen (for strength and superiority in war lay in them; for without orderly formations the hoplite element is useless, and experiences in such things and orderly formations did not exist among the ancients, so that their strength lay in their cavalry). But as cities grew larger, and those with hoplite weapons became a stronger force, more people shared in the constitution. That is why what we now call "polities" used to be called "democracies." The ancient constitutions, on the other hand, were oligarchic and kingly, and reasonably so. For because of their small population they did not have much of a middle class, and so the people, because they were inferior in number and in organization, put up with being ruled.

What the causes are, then, of there being several constitutions, and why there are others besides those spoken about (for democracy is not one in number, and likewise neither are the others), and further, what their differences are, and due to what cause they arise, and, in addition to this, which constitution, speaking for the majority of cases, is best, and which among the others fits which sort of city, have now been stated.

4.14
The Deliberative Element in a Constitution

Let us again, in connection with what comes next, discuss constitutions in common and each one separately, taking the starting-point that is appropriate to these issues. There are, then, three parts in all constitutions by reference to which an excellent legislator must get a theoretical grasp on what is advantageous for each constitution. When these parts are in good condition, the constitution is necessarily in good

161. Reading ποῖον.

condition, and constitutions differ from each other by differing in each of these parts. One of the three parts is the one that deliberates about communal affairs; the second concerns the offices, that is to say, which offices there should be, with control of what things, and in what way officials should be chosen; and the third is the one that judges suits. **1298ᵃ1**

The deliberative part has control concerning war and peace and the making and breaking of alliances, concerning laws, and concerning death, exile, and the confiscation of property, and concerning the election and inspection of officials. And it is necessary that either all these sorts of judgments be assigned to all the citizens; or all to some of them (to some single office, for example, or to several, or some to some and others to others); or some to all and some to some.

For all to deliberate about all issues is characteristic of a democracy; for this is the sort of equality the people seek. But there are several ways of having all of them do so. One way is by turns rather than all together, as in the constitution of Telecles of Miletus. And there are other constitutions in which deliberation is carried out by boards of officials meeting jointly, and all enter office by turn from the tribes and from the smallest parts of the city, until all have been gone through, and they all meet together only to consider legislation, and matters pertaining to the constitution, and to listen to official announcements. Another way is where they all meet, but only for the choosing of officials, for legislation, matters of war and peace, and for inspections, while other matters are deliberated on by the officials assigned to deal with the particular area in question, these being chosen from all the citizens either by election or by lot. Another way is for the citizens to meet together about offices and inspections, and to deliberate about war and alliances, and for other matters to be dealt with by offices which as far as possible are filled by election, these being the ones where it is necessary to have people ruling who have scientific knowledge. A fourth way is for all to meet and deliberate about all matters, while the officials make no judgments, but only prepare issues for judgment. This is the way in which the final democracy[162] is managed as things stand, the one we say is analogous to a dynastic oligarchy or a tyrannical monarchy. All these ways, then, are democratic.

But for certain people to deliberate about all matters is oligarchic. But here too there are several differences. For when they are chosen on the basis of more moderate property assessments, and there are more of them because of the moderateness of the assessments, and where they do not attempt to make changes that the law forbids, but rather follow it, and where everyone who has the assessed amount may share—a constitution of this sort is certainly an oligarchy, but because of its moderateness, one with the character of a polity. When not everyone shares in deliberation but only those elected, and when, as before, they rule in accord with law, it is oligarchic. When those who have control of deliberation elect themselves, and when son succeeds father, and they have control of the laws, this order is necessarily most oligarchic. **1298ᵇ1**

162. 1292ᵃ4–37.

But, when some have control of some matters—for example, when all have it over war and peace and inspections, while officials, who are elected and not chosen by lot, have it in the other areas, it is an aristocracy or[163] a polity. But if it happens that elected officials have control in some areas, while officials chosen by lot (either unconditionally or from a pre-selected group) have it in others, or if elected officials and officials chosen by lot share control, some of these are features of an aristocratic constitution and others of polity itself.

This is the way, then, that the deliberative part is distinguished in the various constitutions, and each constitution administers matters in accord with the determinations that were mentioned.

In the sort of democracy that now seems most of all to be a democracy (I mean the sort in which the people have control even over the laws), it is advantageous from the point of view of improving deliberation to do precisely the same thing as is done in oligarchies in regard to the courts (for they assign a fine for those people they want to have on juries to ensure that they serve as judges, while democrats pay the poor). Absolutely the same should be done in the case of assemblies too (for they will deliberate better if all deliberate together, the people with the notables, and the latter with the multitude). It is advantageous too if those who do the deliberating are elected or chosen by lot in equal numbers from these parts. And even if the democrats among the citizens are greatly superior in numbers, it is advantageous either not to provide pay for all of them, but only for a number commensurable with the number of notables, or to exclude the excess by lot.

In oligarchies, on the other hand, it is advantageous either to choose some additional people from the multitude or to establish a board of officials (like the so-called preliminary councilors or law-guardians that exist in some constitutions), and then [have the assembly] transact only the business that these have considered first (for, in this way, the people will share in deliberation, but will not be able to abolish anything concerning the constitution). Further, it is advantageous to have the people vote on decrees that are either the same as those brought before them [by the board], or on nothing contrary to them, or else to let all give advice and have only officials deliberate. Also, one should do the opposite of what happens in polities. For one should make the multitude have control when vetoing decrees but not when approving them; in the latter case, they must be referred back to the officials instead. For in polities they do the reverse; for the few have control when vetoing decrees but not when approving them, decrees of the latter sort always being referred back to the majority instead.

Concerning the deliberative part, then, and the part that has control of the constitution, let matters be determined in this way.

163. Reading ἢ.

4.15
Offices

Next after these things is the division of the offices. For this part of a constitution too has many differences: how many offices there are and with control of what things; and with regard to time—how long each office is to last (for some make it six months, others less, some make it a year, others a longer period), and whether the offices should be held permanently or for a long time, or neither of these, but instead the same people may hold office several times, or the same person not even twice but only once; further, as regards the appointment of officials—from whom they should come, by whom chosen, and in what way. Concerning all these one should be able to distinguish how many modes there can be, and then fit the sorts of offices to the sorts of constitutions for which they are advantageous.

But even that much is not easy, to determine what are to be called "offices"; for a political community needs many sorts of supervisors, which is why not everyone who is chosen by vote or by lot can be regarded as an official. In the first place, for example, there are the priests (for a priesthood must be counted as something other than and beyond the political offices). Further, patrons of the theater and heralds are elected, as are ambassadors. But some sorts of supervision are political, either concerned with all the citizens involved in a certain action (as a general supervises those who are serving as soldiers), or some part of them (as the supervisor of women or the supervisor of children). Some are related to household management (for grain rationers are often elected), while others belong to assistants (and to these, if they have the resources, they assign slaves).

Simply speaking, however, those that must most of all be called "offices" are those responsible for deliberating about certain matters, for judging, and for prescribing [what is to be done], and above all the latter; for issuing prescriptions is more characteristic of ruling. But this makes (one might almost say) no difference as regards use (for as yet no judgment has been handed down to anyone disputing over the name), although there is some further study for thought to do on it.

What sorts of offices, and how many, are necessary for the existence of a city, and what sorts, though not necessary, are yet useful for an excellent constitution, are puzzles one might raise with regard to every constitution, but especially with regard to small cities.[164] For in large cities one can and should assign a single office to a single work (for because there are many citizens, there are many people to take up office, so that some offices are held again only after a long interval and others are held only once, also each work is better performed when its supervision is engaged in one thing rather than being engaged in many things). In small cities, on the other hand, many offices have to be co-assigned to a few people (for underpopulation makes it **$1299^{b}1$** hard to have many people in office; for who will succeed them in their turn?). But

164. Listed in 6.8.

sometimes small cities need the same offices and laws as large ones, except that the latter need the same ones often, while the former need them only at long intervals. That is why nothing prevents their assigning many sorts of supervision [to the same officials] at the same time (for they will not impede each other), and why, because of underpopulation, they must make their boards of officials like spit-lamps.

If, then, we can say how many offices it is necessary for every city to have, and how many are not ones it is necessary for it to have but that it should have, it will be easier, in the light of this, to determine which offices it is fitting to combine into a single office. But it is also fitting not to overlook the question of which matters should be supervised by numerous local offices, and which a single office should everywhere have control of. For example, in the case of good order whether a market manager should have control of this in the marketplace, and another official in another place, or the same one everywhere; and whether offices should be distinguished by the thing or by the people [they deal with]—I mean, for example, whether there should be a single office for good order, or one for children and another for women.

And with regard to the constitutions too, whether the kind of offices also differs in each constitution, or not at all. For example, whether in a democracy, an oligarchy, an aristocracy, and a monarchy, the same offices have control, even though they are not filled from equal or even similar people, but from different sorts in different constitutions (for example, from the well educated in aristocracies, from the rich in oligarchies, and from the free in democracies), or whether certain offices exist that are, for their part, in accord with these differences, with sometimes the same offices and sometimes different ones being advantageous (for it is fitting for the same offices to be large in some places and small in others).

Nonetheless, some offices are indeed special [to certain constitutions]—for example, that of the preliminary councilors; for it is non-democratic. A council, by contrast, is democratic; for there must be some body of this sort to take care of preliminary deliberation on behalf of the people, so they can do their work. It is oligarchic, though, if the councilors are few in number. But the preliminary councilors are necessarily few in number, so that their office is oligarchic. Where both these offices exist, however, the preliminary councilors are put in place as a check on the councilors; for a councilor is democratic, a preliminary councilor, oligarchic. But the power of the council is also destroyed in those sorts of democracies in which it
1300a1 is the people themselves who come together and transact all business. This happens when there is wealth of the sort that provides pay to those who attend the assembly; for they then have the leisure to meet often and judge everything themselves. But the supervisor of women, the supervisor of children, and any other office that has control of this sort of supervision are aristocratic, not democratic (for how can one prevent the women of the poor from going out?) or oligarchic (for the women of oligarchs live luxuriously).

Concerning these issues let this much be determined for now, but concerning the appointment of officials, we must attempt to go through things from the start.

Differences here lie in three defining marks, the combination of which necessarily yields all the modes. Among these three, the first is who appoints the officials, second, from whom, and, lastly, in what way. And of each of these three there are three different sorts. Either all the citizens appoint or some do; and they appoint either from all or from certain determinate groups (determined by a property assessment, for example, or by breeding, or by virtue, or by some other feature of that sort—as in Megara where they appointed from those who returned from exile together and fought together against the people); and they appoint either by election or by lot; and, again, these may be coupled—I mean that all may appoint to some offices and some to others, some offices may be appointed from all and others from some, and some may be appointed by lot and others by election.

In the case of each of these differences, there will be four[165] modes. Either all appoint from all by election or all appoint from all by lot; or all appoint from some by election; or all appoint from some by lot (and, if from all, either by sections—by tribe, for example, or by deme or clan, until all the citizens have been gone through—or from all on every occasion); or partly in the first way and partly in the second. Again, if only some appoint, they may do so either from all by election or from all by lot; or from some by election or from some by lot; or partly in the first way and partly in the second—I mean, partly from all by election and partly by lot, and partly from some by election and partly by lot. This gives rise to twelve modes that are separate from the two couplings.

Among these ways of appointing, three are democratic, when all appoint from all by election, by lot, or by both (that is, for some offices by election and for some by lot). But when not all appoint at the same time, but do so from all or from some, whether by election, lot, or both, or from all for some offices and from some for others, whether by election, lot, or both (by "both" I mean some by lot and others by election)—it is characteristic of a polity. When some appoint from all, whether by election, lot, or both (for some offices by lot, for others by election), it is oligarchic—although it is more oligarchic to do so by both. But when some offices are appointed from all and others from some or when some are appointed by election and some by lot, this is characteristic of an aristocratically governed constitution. When some **1300b1** appoint from some by election, it is oligarchic, also when some appoint from some by lot (even if this does not actually occur), and when some appoint from some in both ways. But when some appoint from all, and when all appoint from some by election, it is aristocratic.

These, then, are the number of modes of appointing to offices, and this is the way they are divided in accord with the constitutions. Which are advantageous for which constitutions, and how appointments are to be made, will become evident once we determine the powers of the offices, and which these are. By the "power" of an office I mean, for example, control of revenues or control of defense—for the form of power

165. Reading τέσσαρες.

that is like the one belonging to a generalship is different from that belonging to control of marketplace contracts.

4.16
The Judicial Element

Among the three parts,[166] it remains to speak about the judicial. And the modes of these [offices] must be grasped in accord with the same hypothesis. There is a difference between courts that lies in three defining marks: from whom; about what; and in what way. "From whom": I mean whether they are appointed from all or from some. "About what": how many forms of courts there are. "In what way": whether by lot or election.

First, then, let us determine how many forms of courts there are. They are eight in number. One is the court of inspection of officials. Another is concerned with cases in which someone does something unjust in some matter concerning the community does something unjust. Another is concerned with matters that bear on the constitution. A fourth is concerned with officials and private individuals in disputes about fines. A fifth is concerned with private transactions of some magnitude. Besides these there is a court that is concerned with homicide and one that is concerned with aliens.

The forms of homicide court, whether having the same juries or not, are that concerned with premeditated homicide, that concerned with involuntary homicide, that concerned with cases where the fact is admitted but the justice of it disputed, and a fourth concerned with charges brought against those who have been exiled for homicide after their return (the court of Phreatus[167] in Athens is said to be an example), but cases of this sort are rare at any time even in large cities. The aliens' court has a part for aliens disputing with aliens and a part for aliens disputing with citizens.

Further, besides all these, there is a court that is concerned with petty transactions: those involving one drachma, five drachmas, or a little more (for judgment must be given in cases of this sort too, but it should not fall to a multitude of judges to give it).

But let us set aside these courts, as well as the homicide and aliens' courts, and speak about the political ones, which, when not well managed, give rise to disagreements and constitutional changes. Of necessity, either all judge all the cases just now distinguished, and are appointed either by lot or by election; or all judge all of them and some are appointed by lot and some by election; or, although dealing with the same cases, some judges may be appointed by lot and some by election. These modes, then, are four in number.

1301a1

There are as many too when appointment is from only some of the citizens. For here again either the juries are appointed from some by election and judge all cases;

166. 1297b36–1298a3.
167. *Ath*. 57.3.

or they are appointed from some by lot and judge all cases; or some may be appointed by lot and some by election; or some courts dealing with the same cases may be composed of both allotted and elected members. These modes, as we said, are the counterparts of the ones we mentioned previously. Further, these same ones may be conjoined—I mean, for example, some may be appointed from all, others from some, and others from both (as, for example, if the same court had juries appointed partly from all and partly from some); and the appointment may be either by lot or by election or by both.

How many modes the courts admit of, then, has now been stated. Among these, the first, those which are appointed from all and judge all cases, are democratic. The second, those which are appointed from some and judge all cases, are oligarchic. The third, those which are partly appointed from all and partly from some, are aristocratic or characteristic of a polity.

BOOK 5

5.1
Changing and Preserving Constitutions

Pretty much all the other issues, then, that we deliberately decided on have been spoken about. And after what has been said, what must next be investigated are the sources of change in constitutions, how many they are and of what sort; what things destroy each constitution; from what sort into what sort they mostly change; further, what things preserve constitutions in general and each constitution in particular; and, finally, the means by which each constitution is best preserved.

One should first take as a starting-point that many constitutions have come into existence because, though everyone agrees about justice and proportional equality, they are in error about it, as was also said previously.[168] For democracy arose from those who are equal in some respect, thinking themselves to be unconditionally equal (for, because they are equally free, they think they are unconditionally equal). Oligarchy, on the other hand, arose from those who are unequal in some respect, taking themselves to be wholly unequal (for, because they are unequal in property, they take themselves to be unconditionally unequal). And so the former claim to be worthy of an equal share of everything, on the grounds that they are all equal, while the latter, because they are unequal, seek to get more (for a bigger share is an unequal one). All these constitutions, then, have a certain sort of justice, although unconditionally they are mistaken. And it is due to this cause that, when one or other of them does not share in the constitution in accord with the supposition [about justice] they

168. 1280ᵃ7–25, 1282ᵇ14–23.

happen to have, they engage in faction. But those who would most have justice on their side in engaging in faction, though the least likely to do so, are those who are outstanding in virtue; for they alone are the ones it is most reasonable to regard as unconditionally unequal. There are also certain people, those who are superior in family, who suppose that they are not worthy of merely equal things, because they are unequal in this way; for people are believed to be noble when they have ancestral virtue and wealth.

These, then, are (one might almost say) the starting-points and springs of factions—the sources from which people engage in faction. That is also why the changes are twofold. For sometimes people engage in faction against the constitution in order to change from the one that is in place to one of another sort—for example, from democracy to oligarchy, or from oligarchy to democracy, or from these to polity or aristocracy, or from the latter to the former. Sometimes, though, they engage in faction not against the constitution that is in place (for example, an oligarchy or a monarchy), which they deliberately choose to keep the same, but wish it to be in their hands. Further, it may be a question of more or less—for example, where there is an oligarchy, the aim may be to make it more oligarchically ruled or less so; where there is a democracy, to make it more democratically ruled or less so; and similarly, in the case of the remaining constitutions, the aim may be to tighten or loosen them. Further, the aim may be to change a certain part of the constitution—for example, to put in place or abolish a certain office, as some say Lysander tried to abolish the kingship in Sparta, and King Pausanias the overseership. In Epidamnus too the constitution was changed with regard to one part (for a council replaced the tribal rulers, though it is still the case that only those members of the governing body who hold office are obliged to attend the public assembly when election to office is taking place—the single [supreme] official was also an oligarchic feature of this constitution).

For faction is everywhere due to inequality, when unequals do not receive what is proportional (for a permanent kingship is unequal if it exists among equals); for people generally engage in faction in pursuit of equality. But equality is twofold, numerical equality and equality in accord with worth. By "numerical equality" I mean being the same and equal in number or size; by "equality in accord with worth," what is the same and equal in ratio. For example, in number, three exceeds two and two exceeds one equally, but in ratio, four exceeds two and two exceeds one equally; for two and one are equal parts of four and two; for both are halves.

But, though people agree that what is unconditionally just is what is in accord with worth, they still disagree, as was said previously,[169] since some regard themselves as wholly equal if they are equal in a certain respect, while others claim to be worthy of inequality in everything if they are unequal in a certain respect. That is also why two constitutions mostly arise: democracy and oligarchy; for good breeding and virtue are found in few people, while these things [freedom (democracy) and wealth

169. 1301a25–28.

(oligarchy)] are more widespread; for no city has a hundred good and well-bred men, **1302ᵃ1**
but there are rich ones in many places.[170]

For a constitution to be ordered simply and entirely in accord with either sort of equality, however, is bad. This is evident from what actually happens; for no constitution of this sort is steadfast. The cause of this is that it is impossible, when the first 5
thing—the starting-point—is in error, for the result not to be in the end something bad. That is why numerical equality should be used in some cases, and equality in accord with worth in others.

Nonetheless, democracy is more stable and freer from factional conflict than oligarchy. For in oligarchies, two sorts of faction arise, one among the oligarchs themselves, and another again against the people. In democracies, on the other hand, the 10
only faction is against the oligarchic element, since no faction worth mentioning arises among the people themselves against themselves. Further, a constitution based on those in the middle is closer to a democracy than to an oligarchy, and this one is the most stable constitution of these sorts. 15

5.2
Principal Starting-Points of Political Change

Since we are investigating the sources from which both factions and changes arise in constitutions, their starting-points and causes must first be grasped in universal terms. There are, then, pretty much three in number, each of which must first be defined in outline by itself. For one should grasp the disposition of people who 20
engage in faction; for the sake of what they do so; and, third, what the starting-points are of political disturbances and factions among people.

Of people's being in some way disposed to change [their constitution], then, what is most of all to be counted as the universal cause is the one we have in fact already mentioned.[171] For those who pursue equality engage in faction when they believe that they get less, even though they are the equals of those who get more, while 25
those who pursue inequality (that is to say, superiority) do so when they believe that, though they are unequal, they are not getting more, but rather the same or less (but it is possible, sometimes to desire these things justly, sometimes unjustly); for those who are inferior engage in faction in order to be equal, while those who are equal do so in order to be superior. The disposition of those who engage in faction has now 30
been stated.

The things about which people engage in faction are profit, honor, and the contraries of these. For people also engage in faction in cities to avoid dishonor and fines, either for themselves or for their friends.

170. Rejecting the addition of καὶ ἄποροι.
171. 1301ᵃ33–35, 1301ᵇ35–39.

The causes and starting-points of the changes—the sources that dispose people to feel in the way described about the issues mentioned—happen in one way to be seven in number and in another more. Two of them are the same as those just mentioned, but not in the same way; for people are also stirred up against each other by profit and honor not simply in order to get them for themselves, which is what was said previously, but because they see others, some justly and some unjustly, getting more of these. Other causes are wanton aggression, fear, superiority, contempt, and disproportional growth. Still others, although operating in another way, are intrigue, contempt, small differences, and dissimilarity.

5.3
Particular Starting-Points of Political Change (1)

Among these, the capacity that wanton aggression and profit have and how they are causes are pretty much evident; for it is when officials are wantonly aggressive and want to get more that people engage in faction both against each other and against the constitutions that gave the officials control. And their getting more is sometimes at the expense of private, sometimes at the expense of communal, funds.

It is also clear what honor has the capacity to do and how it is a cause of faction; for people engage in faction both when they are dishonored themselves and when they see others being honored. These things occur unjustly when people are honored or dishonored contrary to their worth, justly, when in accord with their worth.

Faction arises because of superiority when someone (an individual or a group of individuals) is greater in power than is in accord with the city and the power of the governing body; for when there are people like that a monarchy or a dynasty usually arises. That is why some places, such as Argos and Athens, have a practice of ostracism. And yet it is better to see to it from the start that no people with so great a superiority arise than to supply a remedy after having allowed it to happen.

People engage in faction because of fear both when they have committed injustice and are afraid of punishment and when they think they are about to suffer injustice and wish to take preemptive action before they suffer injustice. The latter occurred in Rhodes[172] when the notables united against the people because of the suits being brought against them.

People also engage in faction and attack each other because of contempt. For example, this occurs in oligarchies when those who do not share in the constitution are a majority (for they consider themselves the stronger party), and in democracies, when the rich are contemptuous of the disorder and anarchy. For example, the democracy in Thebes was destroyed because they were governed in a bad way after the battle of Oenophyta, as was the democracy of the Megarians when they were defeated

172. Presumably the event referred to at 1302b32–33 and 1304b27–31.

because of disorder and anarchy, and [it was the same story] in Syracuse, before the tyranny of Gelon, and in Rhodes prior to the revolt.[173]

Constitutional changes also occur because of disproportional growth. For a body is composed of parts, and these must grow in proportion if symmetry is to be maintained, and if it is not, the body will be destroyed—as, for example, when a foot is four cubits[174] long and the rest of the body two spans,[175] or, if the disproportional growth is not only quantitative but also qualitative, its shape might change to that of another animal.[176] So, similarly, a city too is composed of parts, one of which often grows without being noticed—for example, the multitude of the poor in democracies or polities. **1303[a]1** This sometimes also happens because of luck. At Tarentum, for example, a democracy arose from a polity when many notables were killed by the Iapygians shortly after the Persian Wars.[177] In Argos too, after the men of the seventh were killed by the Spartan Cleomenes,[178] the notables were compelled to admit some of their subject peoples to citizenship. And in Athens, when they had bad luck fighting on land, the notables were reduced in number, because at the time of the war against Sparta[179] service in the army was based on the citizen register. This sort of change also occurs in democracies, although to a lesser extent; for when the rich become more numerous or their properties increase in size, democracies change into oligarchies or dynasties.

But constitutions also change without the occurrence of faction, both because of intrigue, as happened in Heraea (for they replaced election with selection by lot because of this, because those who intrigued were getting elected), and also because of neglect, when people who are not friendly to the constitution are allowed to occupy the offices with supreme control. Thus the oligarchy in Oreus was overthrown when Heracleodorus became one of the officials and established a polity, or rather a democracy, from the oligarchy.[180]

Further, constitutions change because of a small difference. I mean by "small" that often a great change in the laws occurs unnoticed when something small is overlooked. In Ambracia, for example, the property assessment was small, but in the end people with no property came to hold office, the assumption being that the small is very close to, or no different from, none.

Not belonging to the same race also tends to cause faction, until people join together; for just as a city does not arise from any random multitude, neither does it arise in a random period of time. That is why most of those who have admitted

179. The Peloponnesian War (431–404 BC).
180. In 377 BC.

co-colonists or late-colonists have experienced factional conflict. The Achaeans co-colonized Sybaris with the Troezenians, but later, when the Achaeans became more numerous, they expelled the Troezenians (this was the cause of the curse that fell on the Sybarites).[181] In Thurii too, Sybarites came into conflict with their co-colonists (for when they claimed to be worthy of a larger share on the grounds that the territory was theirs, they were expelled). In Byzantium too the late-colonists were discovered plotting against the original colonists and were expelled because of a battle. The Antissaeans expelled by combat the Chian exiles they had admitted. The Zanclaeans were themselves expelled by the Samians they had admitted.[182] The Apolloniates on the Black Sea engaged in faction after admitting late-colonists.[183] The Syracusans, after the period of the tyrants,[184] when they granted citizenship to foreigners and **1303b1** mercenaries, engaged in faction and broke into battle. The Amphipolitans admitted late-colonists from Chalcis and were almost all expelled by them.

{In oligarchies, as was said previously,[185] the many engage in faction on the grounds that they are treated unjustly because they do not share equally, in spite of being equal. In democracies, the notables do so because they do share equally, in spite of not being equal.}[186]

Cities sometimes also engage in faction because of their location, when the condition of their territory is not naturally well suited for there being one city. In Clazomenae, for example, the inhabitants of Chytrus[187] came into conflict with those on the island, as did the inhabitants of Colophon and those of Notium. At Athens too the people are not all alike, but those in Piraeus are more democratic than those in the city proper.

For just as in war, where crossing even small ditches breaks up the phalanx, so too every difference seems to produce disagreement. The greatest disagreement is presumably between virtue and vice; next that between wealth and poverty; and so on for the others, including the one just discussed, with each one greater than the next.

5.4
Particular Starting-Points of Political Change (2)

Factions arise, then, not about small things, but out of small things—it is about important things that people engage in faction. Even small factions become especially strong, however, when they arise among those in control—as happened, for example,

181. The precise nature of the curse is unknown, but driving out fellow colonists would have been viewed as an act of great sacrilege.

in Syracuse in ancient times. For the constitution was changed because two young men in office engaged in faction over a love affair. For, while the first was away, the second, who was his comrade, seduced his boyfriend. The first, enraged at him, retaliated by inducing the second's wife to commit adultery. For this reason they drew the governing body into their disagreement and split everyone into factions. That is precisely why one should be circumspect when such things are starting, and dissolve the factions of leaders and powerful men; for the error arises in the starting-point, and the starting-point is said to be half the whole, so that even a small error in it is comparable to [all] the errors made at the later stages.

Factions among the notables generally make the whole city share in the "enjoyment," as happened in Hestiaea, for example, after the Persian Wars when two brothers quarreled about the division of their inheritance; for the poorer one, claiming that his brother had not declared the true value of the property or of the treasure their father had found, enlisted the aid of the people, and the other, who had much property, enlisted the aid of the rich. In Delphi, a quarrel arising because of a marriage alliance was the starting-point of all the subsequent factions; for the bridegroom came to fetch the bride, but some accident occurred that he interpreted as a bad omen, and he left **1304ª1** without her. Her family, on the grounds that they had been treated with wanton aggression, planted some sacred objects on him while he was sacrificing and then killed him as a temple robber. In Mytilene too a faction concerning heiresses was the starting-point of many evils and, in particular, of the war with the Athenians, in which Paches captured their city. For a rich citizen named Timophanes left behind two daughters, and when Dexander, who wanted to obtain them for his own sons, had his suit rejected, he started a faction and incited the Athenians, whose agent he was, to interfere. Among the Phocians, a conflict arose over an heiress, involving Mnaseas the father of Mnason and Euthycrates the father of Onomarchus, which conflict was the starting-point of the Sacred war for the Phocians.[188] And in Epidamnus the constitution was changed because of matters having to do with a marriage;[189] for a man had betrothed his daughter, and the father of the one to whom he had betrothed her, becoming one of the officials, imposed a fine on him, whereupon the first allied himself with all those who were outside the constitution on the grounds that he had been insulted.

Constitutions also change to oligarchy, democracy, and polity as a result of some office or part of the city acquiring high repute or increasing in size. For example, the council of the Areopagus, which was held in high repute in the Persian Wars, was believed to have made the Athenian constitution tighter.[190] And, in return, the seafaring mob—having been the cause of the victory at Salamis,[191] and, as a result of this, of the [Athenian] hegemony due to their power at sea—made the democracy stronger. In Argos, the notables, having acquired prestige in connection with the battle against

188. 355–347 BC.

190. *Ath*. 41.2.
191. 480 BC.

the Spartans at Mantinea,[192] undertook to overthrow the democracy. In Syracuse, the people, having been the cause of victory in the war against the Athenians, changed the constitution from a polity to a democracy.[193] And in Chalcis, the people, together with the notables, overthrew the tyrant Phoxus, and then immediately took control of the constitution. Similarly, in Ambracia, the people joined with the opponents of Periander to expel him and afterward took the constitution into their own hands.[194] Generally speaking, then, this should not be overlooked, that the people who come to be responsible for a city's power—whether private individuals, officials, tribes, or, in general, a part or multitude of any sort whatever—stir up faction; for either those who envy them for being honored start a faction, or they themselves, because of their superiority, are unwilling to remain on equal terms.

Constitutions also undergo change when parts of a city that are believed to be opposed to each other, such as the rich and the people, become equal to each other, **1304b1** and there is an altogether small middle class; for if either of the parts becomes greatly superior, the remaining one will be unwilling to risk going up against the manifestly stronger one. That is why those who are superior in virtue do not produce (one might almost say) any faction; for they are few against many.

Universally, then, in all constitutions, the starting-points and causes of factions and changes have this mode of operation. But people change constitutions sometimes through force, sometimes through deceit. When it is through force, they use compulsion either right from the start or later on. In fact, deceit is also twofold. For sometimes, after having used deceit at first, they change the constitution while the others accept it voluntarily, and then later keep hold of it by force, when the others accept it involuntarily—for example, the Four Hundred deceived the Athenian people by telling them that the king of Persia would provide money for the war against the Spartans, and, having deceived them, tried to keep the constitution in their own hands.[195] At other times, they persuade them from the start, and later on again, due to their being persuaded, rule them with their voluntary consent.

Putting it simply, then, changes occur in all constitutions on the basis of what has been stated.

5.5
Political Change in Democracies

Taking apart each form of constitution separately, we should, on the basis of what has been stated, get a theoretical grasp on what happens to it.

192. 418 BC.
193. 413 BC.
194. In c. 580 BC. Further details at 1311a39–b1.
195. *Ath*. 32.3.

Democracies undergo change mostly because of the wanton behavior of popular leaders; for sometimes they bring malicious suits against owners of substantial private property, causing them to join forces (for a common fear brings together even the bitterest enemies), and sometimes publicly setting the multitude on them. One may see this sort of thing happening in many cases. In Cos the democracy was overthrown when wicked popular leaders arose (for the notables united [against them]). In Rhodes[196] too the popular leaders provided pay [to the people], preventing the naval officials from getting what they were owed, and so the latter, because of the suits brought against them, were then compelled to join together and overthrow the democracy. In Heraclea too, right after the colony was settled, the democracy was overthrown because of its popular leaders; for the notables were treated unjustly by them and went into exile, but later on the exiles grouped together, returned home, and overthrew the democracy. And the democracy in Megara[197] was overthrown in much the same way; for the popular leaders expelled many of the notables in order to have wealth to confiscate, until they made the exiles numerous. The exiles then returned, defeated the people in battle, and put in place an oligarchy. The same thing happened to the democracy in Cyme, which was overthrown by Thrasymachus. And **1305ᵃ1** if one got a theoretical grasp on them, one would see in the case of other cities as well that changes occur in pretty much this way. For popular leaders, in order to gratify the people, sometimes treat the notables unjustly, by redistributing their properties or their profits by means of public services, and cause them to join together, and sometimes they bring slanderous accusations in order to be able to confiscate the property of the rich.

In ancient times, whenever the same person was both a popular leader and a general, democracies changed to tyranny; for pretty much most ancient tyrants arose from popular leaders. The cause of this happening then but not now is that then popular leaders used to come from the ranks of those who held the office of general (for no one was as yet skilled at public speaking). Now, however, with the development of rhetoric, those who are capable public speakers become popular leaders. But because of their inexperience in military matters, they do not try to make an attack on anyone, although a few cases of this sort may have occurred somewhere.

Tyrannies also arose more frequently in former times than they do now because important offices were in the hands of certain individuals, as in Miletus, where a tyranny[198] arose out of the presidency, because the president had control of many important matters. Further, because cities were not large then and the people lived on their farms and were unleisured, being engaged in their works, so whenever the champions of the people became skilled warriors they attempted to impose a tyranny. They all did this after gaining the people's trust, and this trust was due to their hatred

196. 1302ᵇ23–24.
197. 1302ᵇ31.
198. Perhaps that of Thrasybulus.

of the rich. For example, in Athens Pisistratus[199] [was thought to deserve to be tyrant] because he engaged in faction against the plains-dwellers, and in Megara, Theagenes, because he slaughtered the rich men's cattle when he caught them grazing by the river. And Dionysius[200] was thought worthy of the tyranny for prosecuting Daphnaeus and the rich—because of his hostility, he was trusted as someone who believes in democracy.

Democracies also change from ancestral democracies into democracies of the most recent sort; for when officials are elected, but not on the basis of property assessments, and the people do the electing, those eager for office, by acting the part of popular leaders for them, bring matters to this point, that the people have control even over the laws. A remedy, so that this does not occur, or occurs less often, is to have the tribes, and not the people as a whole, nominate the officials.

Pretty much all the changes in democracies, then, happen due to these causes.

5.6
Political Change in Oligarchies

Oligarchies mostly undergo change in two ways that are most evident. One is when they treat the multitude unjustly; for in this situation anyone proves to be an adequate champion, especially when he comes from the oligarchy itself, like Lygdamis in Naxos, who actually became tyrant of the Naxians later on. As for faction that **1305b1** takes its starting-point from others, it also admits of differences. For sometimes the overthrow comes from the rich themselves, although not from the ones in office, when those enjoying the honors of office are altogether few. This occurred in Massalia, Istrus, Heraclea, and other cities; for those who did not share in office agitated until first elder brothers and later in turn the younger ones were admitted (for in some cities, a father and son, and in others, an elder and younger brother, may not hold office at the same time). And there in Massalia the oligarchy became more like a polity, while the one in Istrus ended in a democracy, and the one in Heraclea went from a small number to six hundred. In Cnidus too the oligarchy changed when the notables were engaged in faction among themselves because so few shared in office and because, as was stated, if a father shared, his son could not do so, nor, if there were several brothers, could any do so except the eldest; for while the notables were engaged in faction, the people seized the opportunity, picked one of the notables as their champion, attacked, and were victorious, for what is engaged in faction is weak. And in Erythrae in ancient times, during the oligarchy of the Basilids, even though those with control of the constitution supervised things well, the people nonetheless resented being ruled by a few and changed the constitution.

199. *Ath*. 13–14.
200. I.e., Dionysius I.

Oligarchies also undergo change from within themselves through the rivalry of those engaged in acting the part of popular leaders. This popular leadership is twofold. One exists among the oligarchs themselves; for a popular leader can arise even when they are very few. For example, among the Thirty in Athens Charicles and his followers became powerful by acting the part of popular leaders for the Thirty, and likewise in the time of the Four Hundred with Phrynichus[201] and his followers. [Or it may take place] when the oligarchs act the part of popular leaders for the mob. For example, in Larissa the civic guards acted the part of popular leaders for the mob because it elected them. And it is the same in all oligarchies where those who elect to office are not those from whom the officials are drawn, but offices are filled either from those with high property assessments or those who belong to certain political clubs, while the electors are either those who possess hoplite weapons or—precisely as happened in Abydus—the people. It also happens wherever juries are not drawn from the governing body—for by acting the part of popular leaders in order to influence judicial decisions, the oligarchs change the constitution, which is precisely what occurred in Heraclea on the Black Sea.[202] Further, it occurs when some draw the oligarchy into fewer hands; for those who want equality are compelled to bring in the people to assist them.

Changes in oligarchy also occur when some of the oligarchs spend away their private resources on loose living; for in fact such people seek to stir up change, and either aim at tyranny themselves or establish someone else as tyrant, as Hipparinus did for Dionysius in Syracuse. In Amphipolis, a man named Cleotimus brought in late-colonists from among the Chalcidians and, after they arrived, made them start factional conflict against the rich. In Aegina, the man who conducted the transaction with Chares tried to change the constitution due to this sort of cause. Sometimes such people try to make changes straightaway, while sometimes they steal public funds. In the latter case either they themselves or those who are opposed to their stealing engage in faction against the oligarchs, which is precisely what happened in Apollonia on the Black Sea.[203] An oligarchy that is in concord, however, is not prone to destruction from within itself. A sign of this is the constitution in Pharsalus; for though the oligarchs are few in number, they have control over many because they treat each other well.

Oligarchies are also overthrown when they produce another oligarchy within the oligarchy. This happens when, though the entire governing body consists of only a few people, not all of these few share in the most important offices, which is precisely what happened at one time in Elis; for though the constitution was in the hands of a few, altogether few of them became senators, because the senators, who numbered

201. *Ath*. 32.2.
202. 1304ᵇ31–34.
203. 1303ᵃ36–38.

only ninety, held permanent office, and because their election was characteristic of a dynasty and similar to the one regarding the senators in Sparta.[204]

Change in oligarchies occurs both in wartime and in peacetime. It occurs in wartime when the oligarchs are compelled, because of their distrust of the people, to employ mercenaries (for the man placed in command of them often becomes a tyrant, like Timophanes in Corinth). And if several men are placed in command, they often set up a dynasty for themselves. Sometimes fear of these consequences leads the oligarchs to give a share of the constitution to the multitude, because they are compelled to make use of the people. In peacetime, because of their distrust of each other, the oligarchs put the guarding of the city in the hands of mercenaries and a neutral official, who sometimes gains control of both sides. This is precisely what happened in Larissa at the time of the rule of Simus the Aleuad, and in Abydus at the time of the political clubs, one of which was that of Iphiades.

Factions also arise when some members of an oligarchy are rejected by others in connection with marriages and suits and are driven to engage in faction—for example, the cases mentioned previously in which marriage was the cause.[205] And Diagoras overthrew the oligarchy of the cavalrymen in Eretria because he was treated unjustly in connection with marriage. The factions in Heraclea and Thebes arose because of a judgment in court, when Eurytion (in Heraclea)[206] and Archias (in Thebes) were justly but factiously punished for adultery by the courts; for their enemies loved
1306b1 rivalry to the point that they had them bound in the pillory in the marketplace.[207]

Many have also been overthrown by those in the constitution who became disgusted because the oligarchies were too much like the rule of a master, like the one in Cnidus and the one in Chios.[208]

But changes also occur because of mischance both in so-called polities and in oligarchies, where eligibility for the council, the courts, and the other offices is based on a property assessment. For often the first assessment is set to suit existing circumstances, so that only a few will share in the oligarchy and only those in the middle class in the polity. But when peace or some other sort of good luck leads to prosperity, properties come to be assessed at many times their original value, so that all the citizens share in all the offices. Sometimes the change occurs gradually, little by little, and is unnoticed, while sometimes it happens more quickly.

Oligarchies change and engage in faction, then, due to these sorts of causes. In general, both democracies and oligarchies sometimes change not into the opposing constitutions but into others of the same kind—for example, from democracies and oligarchies based on law into those with [complete] control, and vice versa.

5.7
Political Change in Aristocracies

In aristocracies factions arise in some cases because few people share in the honors [of office], which is precisely what was said to change oligarchies as well, because aristocracy too is in a way oligarchy (for the rulers are few in both, although not because of the same thing). At any rate, that is why an aristocracy too is thought to be an oligarchy. This necessarily happens above all when there is a group of people who presume themselves equal in virtue to the ruling few—for example, the so-called Sons of the Maidens at Sparta (for they were descended from the Equals), who, when discovered in a conspiracy, were sent off to colonize Tarentum. Or it happens when powerful men, who are inferior to no one in virtue, are dishonored by others who are held in greater honor, as Lysander was by the kings. Or it happens when someone of manly courage does not share in office, like Cinadon, who instigated the rebellion against the Spartiates in the reign of Agesilaus.[209] Or, again, factions arise when some people are very poor and others very rich, as happens especially in wartime. This also happened in Sparta at the time of the Messenian War[210] (this is clear from the poem of Tyrtaeus called "Good Legislative Order"[211]); for those who were hard-pressed because of the war demanded a redistribution of the land. Or, again, when there is **1307[a]1** a powerful man capable of becoming yet more powerful, who engages in faction in order to become sole ruler—just as Pausanias (who was general during the Persian Wars) seems to have done in Sparta, and Hanno in Carthage.

Polities and aristocracies are mostly overthrown, however, because of a deviation from what is just within the constitution itself. For the starting-point of overthrow in a polity is that democracy and oligarchy are not mixed well, and in an aristocracy, of these two and virtue as well, but especially of the two. I mean by "the two," democracy and oligarchy. For it is these that polities and most so-called aristocracies try to mix. For aristocracies differ from what are called "polities" in this respect, and that is why the former of them are less and the latter more stable; for those constitutions that lean more toward oligarchy get called "aristocracies," while those that lean more toward democracy get called "polities." That is why, indeed, the latter sort are more secure than the former; for the majority are the stronger party and are more content with an equal share, while if those living in riches are granted superiority by the constitution, they try to be wantonly aggressive and get more for themselves.

In general, whichever direction a constitution leans toward is the direction in which it changes when either party grows in power—for example, polity into democracy and aristocracy into oligarchy. Or they are changed into their contraries—for example, aristocracy into democracy (for the poorer people, on the supposition that

209. I.e., Agesilaus II.
210. I.e., the Second Messenian War (685–668 BC).
211. Frs. 7–9 Diehl.

they are being unjustly treated, pull it around to its contrary), and polity into oligarchy (for what is alone steadfast is equality in accord with worth and the having of what is one's own). The change mentioned occurred at Thurii. For, because the property assessment for holding office was rather high, a shift was made to a smaller one and to a larger number of offices. But because the notables illegally acquired all the land (for the constitution was still too oligarchic, and they were able to get more as a result). {. . .}[212] But the people, who had received military training during the war, became stronger than the garrison troops, until those who had more of the land [illegally] gave it up.

Further, because all aristocratic constitutions are oligarchic in character, the notables in them especially tend to get more—for example, even in Sparta properties keep passing into fewer and fewer hands. Also, the notables are allowed to do as they please and make marriage alliances with whomever they please. That is why indeed the city of the Locrians was destroyed, because of a marriage alliance with the tyrant Dionysius, something that would not have occurred in a democracy, nor in a well-mixed aristocracy.

Most of all, however, aristocracies are apt to change unnoticed by being overturned little by little, which is precisely what was said previously[213] about all constitutions universally, that even a small difference may cause them to change; for once one thing relating to the constitution is abandoned, after this people can more easily change something that is in a small degree larger, until they change the entire order. This also happened in the case of the constitution of Thurii. For the law allowed the same man to be general only after a five-year interval. But when some of the young men showed military ability and were held in high repute by the multitude of garrison troops, they came to have contempt for the men who were in charge of affairs, and thought that they themselves could easily prevail. Hence they first undertook to abrogate this law, so as to make it possible for the same men to serve as generals continuously, since they saw that the people would vote for them with enthusiasm. The officials in charge of such matters, the so-called councilors, were at first inclined to oppose this. But they let themselves be persuaded, because they thought that once this law was changed, the rest of the constitution would be left intact. Later, however, when they wished to prevent other things from being changed, they were no longer able to do anything more, but the entire order characteristic of the constitution was changed into a dynasty ruled by those men who had begun the process of stirring up change.

All constitutions are subject to change (sometimes from within, sometimes from outside), however, when there is a contrary constitution either nearby or far away but powerful. This is precisely what happened in the time of the Athenian and Spartan empires; for everywhere the Athenians overthrew oligarchies, the Spartans democracies.

212. Some editors mark a lacuna in the text at this point.
213. 1303a20–25.

Where changes and factions in constitutions come from, then, has been pretty much stated.

5.8
How to Preserve Constitutions (1)

We have next to speak about the preservation of constitutions, both in general and about each separately. It is clear, in the first place, that if indeed we know what things destroy a constitution, we also know what things preserve it; for contraries are productive of contrary things, and destruction is contrary to preservation. In well-mixed constitutions, then, just as care should above all be taken to ensure that no one breaks the law in other ways, small [violations] should be especially guarded against; for illegality creeps in unnoticed, in just the way that property gets used up by frequent small expenditures. The expense goes unnoticed because it does not occur all at once; for thought is led to reason fallaciously by them, as in the sophistical argument, "If each is small, so too are all." In one way this is true; in another false; for the whole and the totality of parts is not small, but it is composed of small parts. One thing to guard against, then, is destruction that has a starting-point of this sort.

Next, one must not put one's trust in the subtle devices put together for the sake of deceiving the multitude, for they are refuted by the facts (which sort of subtle constitutional devices we mean was stated previously).[214]

Next, one should notice that not only some aristocracies but also some oligarchies survive, not because their constitutions are secure, but because those in office treat well both those outside the constitution and those in the governing body. They treat well those who do not share in the constitution by not being unjust toward them, and by bringing their leading men into it. And they treat well those who love honor by not being unjust to them in terms of dishonor, or to the many in terms of profit. As for themselves, the ones who do share—they treat each other in a democratic manner. For what democrats seek to extend to the multitude—equality—is not only just but also advantageous for those who are similar. That is why, if the governing body is large, many democratic legislative measures prove advantageous—for example, having offices be tenable for six months, in order that all those who are similar may share in them; for those who are similar are already a sort of people, which is why popular leaders often arise even among them, as was said previously.[215] Further, [with such legislative measures] oligarchies and aristocracies are less likely to fall into dynasties; for officials who rule for a short time cannot so easily do evil as those who rule for a long time, since this is what causes tyrannies to arise in oligarchies and democracies; for either the most important men in the two constitutions aim at tyranny (popular

214. $1297^{a}14$–$^{b}1$.
215. $1305^{b}24$–27.

leaders in democracies, dynasts in oligarchies), or those who hold the most important offices do so, when they hold them for a long time.

Constitutions are preserved not only because of being far away from the factors that destroy them, but sometimes even by being nearby; for fear makes people keep a firmer grip on the constitution. So those who are concerned about their constitution should manufacture fears—so that the citizens defend the constitution, and, like sentries on night duty, never relax their guard—and make what is faraway seem close at hand.

Further, one should try also to guard against the rivalries and factions of the notables, both by means of the laws as well as to prevent those who are not involved in the rivalry from getting caught up in it themselves, since to recognize an evil right from the start of its emerging takes no random person, but rather a man of politics.

As regards change from an oligarchy or a polity because of property assessments, if it occurs while the assessments remain the same but money becomes more plentiful, it is advantageous to investigate the total communal assessment in comparison with that of the past—in those cities with an annual assessment with that of last year's, in larger cities with that of three or five years ago. **1308b1** If the total is many times greater or many times less than it was when the rates qualifying someone to share in the constitution were put in place, it is advantageous to have a law that tightens or loosens the assessment—tightening it in proportion to the increase if the total has excessively increased, loosening it or making it less if the total has decreased. For when oligarchies and polities do not do this, the result is that, if the total has decreased, an oligarchy arises from the latter and a dynasty from the former, and, if it has increased, a democracy arises from a polity and either a polity or a democracy from an oligarchy.

It is something common in democracy, oligarchy, monarchy, and every constitution not to allow anyone to grow too great or out of all due proportion, but to try to give small honors over a long period of time rather than large ones quickly (for people are corrupted by major honors, and not every man can handle good luck). Failing that, constitutions should at least try not to take away all at once honors that have been awarded all at once, but to do so gradually. Also, they should above all try to regulate matters by means of the laws, so as to ensure that no one arises who is greatly superior in power of friends or wealth. Failing this, they should make their banishments be banishments to foreign parts.

But since people also attempt to stir up change because of their private lives, an office should be set up to keep an eye on those whose ways of living are disadvantageous to the constitution, whether to the democracy in a democracy, to the oligarchy in an oligarchy, or similarly for each of the other constitutions.

Due to the same causes one must also guard against the city's flourishing only in regard to one of its parts. A remedy for this is always to place actions and offices in the hands of opposing parts—I mean that the decent are opposite to the multitude, and the poor to the rich. Another remedy is to try to mix together the multitude of

the poor and that of the rich or to increase the middle class (for this dissolves factions caused by inequality).

But the most important thing in every constitution is for it to have the laws and the management of other matters ordered in such a way that it is not possible for the offices to make a profit. One should pay particular heed to this in oligarchies. For the many do not so much resent being excluded from office, and are even glad to be given the leisure to attend to their private affairs, but they do resent it when they think that officials are stealing public funds. At any rate, they are then pained both at not sharing in office and at not sharing in the profits. Indeed, the only way it is possible for democracy and aristocracy to co-exist is if someone were to establish this [law and management]. For it would then be possible for both the notables and the multitude to have what they wish for. For allowing everyone **1309a1** to hold office is democratic, but having the notables actually be in the offices is aristocratic. And this is what will happen on the condition that it is impossible to profit from office; for the poor will not want to hold office, because there is no profit in it, but will prefer to attend to their private affairs, while the rich will be able to hold it, because they need no additional support from public funds. The result will be that the poor will become rich through spending their time on their works, while the notables will not be ruled by random people. To prevent public funds being stolen, then, the handing over of the money should take place in the presence of all the citizens, and copies of the accounts should be deposited with each clan, company, and tribe. And to ensure that people will hold office without seeking profit there should be a law that assigns honors to officials who are well reputed.

In democracies, the rich should be treated with restraint—not only by not having their property redistributed, but by not having their profits redistributed either (as happens unnoticed in some constitutions). It is also better to prevent the rich, even if they wish to do so, from taking on expensive but useless public services, such as paying for choruses, for superintendence at torch races, and other things of the same sort.

In an oligarchy, on the other hand, one should take great care of the poor, and distribute the offices to them that yield some gain. And if one of the rich treats them with wanton aggression, his punishment should be greater than if he does this to his own lot. Also, inheritances should not be passed in accord with a bequest but in accord with family, and the same person should not receive more than one inheritance. In this way, property holdings would be more equitable, and more of the poor could join the ranks of the rich. It is advantageous, both in democracy and in oligarchy, to give either equality or precedence in all other matters to those who share least in the constitution—the rich in a democracy and the poor in an oligarchy. But the offices that have control of the constitution should be kept solely or largely in the hands of those who are from the constitution.

5.9
How to Preserve Constitutions (2)

Those who are to hold the controlling offices must possess three qualities: first, friendship toward the constitution that is in place; next, great capacity for the works of the office; third, virtue and justice of the sort that in each constitution is with a view to the constitution (for if what is just is not the same in all constitutions, there must be differences in justice as well).

But there is a puzzle, when all these qualities are not found in the same person, about how the choice is to be made—for example, if one man knows generalship but is wicked and no friend to the constitution, while another is just and friendly to it, how should the choice be made? It seems that one should look to two things: which of these qualities does everyone share in more and which less? That is why, in the case of the office of general, one should look to experience more than to virtue (for everyone shares in generalship less, but in decency more). In the case of guardianship or stewardship, on the other hand, the contrary holds (for these require more virtue than most possess, while the scientific knowledge they require is common to all).

One might raise this puzzle: If someone has the capacity for office as well as friendship toward the constitution, why does he need virtue? For even the first two will produce what is advantageous. Or is it possible for someone who possesses these two qualities to lack self-control, so that just as these people fail to serve their own interests well, even though they have the knowledge and are friendly to themselves, so nothing prevents them from being the same way in the case of the community?

Simply speaking, whatever features in laws we say are advantageous to constitutions all preserve those constitutions, as does the most important element, often mentioned,[216] of keeping watch that the multitude wishing for the constitution is stronger than the one that does not wish for it.

In addition to all these features, one thing must not be overlooked, which is in fact overlooked by the deviant constitutions, the mean; for many of the features that are believed to be democratic destroy democracies, and many that are believed to be oligarchic destroy oligarchies. Those who think that this[217] is the one and only virtue pull the constitution toward the extreme. They are ignorant of the fact that just as a nose that deviates from the most noble straightness toward being hooked or snub can nonetheless still be noble and please the eye, if it is tightened still more toward the extreme, the part will first be thrown out of due proportion, and in the end will appear not to be a nose at all, because it has too much of one and too little of the other of these contraries, and it is the same way with the other parts [of the body] as well. This, then, can also happen in the case of the constitutions. For it is also possible for an oligarchy or a democracy to be adequate even though it has diverged from the

216. It is actually mentioned only once, at 1296b14–16.

217. I.e., virtue as conceived by democracy, on the one hand, and by oligarchy, on the other.

best order. But if someone tightens either of them more, he will first make the constitution worse, and in the end make it not a constitution at all. That is why legislators and politicians should not be ignorant about which democratic features preserve a democracy and which destroy it, or which oligarchic features preserve or destroy an oligarchy. For neither of these constitutions can exist and endure without rich people and the multitude, but when a leveling of property occurs, the resulting constitution is necessarily of a different sort, so that by destroying these by laws carried to excess, they destroy their constitutions. **1310ᵃ1**

An error is made in both democracies and oligarchies. In democracies popular leaders err wherever the multitude have control of the laws (for they always divide the city in two by fighting with the rich, yet they should do the contrary, and always be regarded as spokesmen for the rich). In oligarchies, the oligarchs should be regarded as spokesmen for the people, and should take oaths that are the contrary of the ones they take now; for in some oligarchies, they now swear, "and I will be hostile to the people and will plan whatever wrongs I can against them," while they should hold and act the part of holding the contrary view, and declare in their oaths, "I will not wrong the people."

But the most important of all the ways that have been mentioned for making a constitution endure, which as things stand everyone neglects, is for citizens to be educated in a way that looks to their constitutions. For the most beneficial laws, even when ratified by all who are engaged in politics, are of no benefit if people are not habituated and educated in the constitution—democratically if the laws are democratic and oligarchically if they are oligarchic. For if indeed lack of self-control exists at the level of a single individual, it also exists at the level of a city.

But to have been educated in a way that looks to the constitution does not mean this: doing whatever pleases the oligarchs or those who wish for a democracy. Rather, it means doing the things that will enable the former to govern oligarchically and the latter to govern themselves democratically. In present-day oligarchies, however, the sons of the rulers live in luxury, while the sons of the poor are hardened by exercise and toil, so that they are more inclined to stir up change and better able to do so. In those democracies, on the other hand, that are held to be especially democratic, the very contrary of what is advantageous has been put in place. The cause of this is that they define freedom incorrectly. For there are two things by which democracy is believed to be defined, by the majority being in control and by freedom; for the just is believed to consist in equality, and what the multitude believes to be equal is believed to be in control, and freedom is believed to be doing whatever one wishes. So in democracies of this sort everyone lives as he wishes, and "for what he craves," as Euripides says.[218] This is base; for living with a view to the constitution should be considered not slavery but preservation.

218. Fr. 891 Nauck.

The sources of change and destruction in constitutions, then, and the features because of which they are preserved and endure, are simply speaking just about this many.

5.10
Changing and Preserving Monarchies

It remains also to go through monarchy, both the sources of its destruction and
40 the features because of which it is naturally preserved. What happens in the case of kingships and tyrannies is pretty much the same as what was said to happen in the
1310b1 constitutions [mentioned]. For kingship is in accord with aristocracy, and tyranny is a combination of the last-most oligarchy and the last-most democracy. That is why, indeed, tyranny is also the most harmful to those it rules, inasmuch as it is composed
5 of two evils and involves the deviations and errors of both these constitutions.

The coming to be of each of these sorts of monarchy lies from the start in contrary sources; for kingship arose to provide help for the decent against the people, and a
10 king is appointed from among the decent men on the basis of a superiority in virtue, or in the actions that spring from virtue, or in accord with a superiority in a family of this sort. A tyrant, on the other hand, is appointed from the people (that is to say, the multitude) to oppose the notables, so that the people may suffer no injustice from them. This is evident from what has happened. For pretty much (one might
15 almost say) all tyrants have come into being from popular leaders, who came to be trusted by slandering the notables. For some tyrannies were put in place in this way in cities that had already grown large, while other earlier ones arose from kings who deviated from ancestral customs and sought to rule more as a master does. Others
20 were put in place by people elected to the offices that have supreme control (for in ancient times, the people appointed "doers of the people's business" and "sacred ambassadors"[219] to serve for long periods of time). Still others arose in oligarchies that gave a single elected official control of the most important offices. For in all these ways it was easy for such people to prevail, if only they wished, because of the power
25 they already possessed through the kingship or through other offices of honor. Thus Pheidon of Argos and others became tyrants while there was already a kingship; the Ionian tyrants and Phalaris as a result of their high office; and Panaetius in Leontini,
30 Cypselus in Corinth, Pisistratus in Athens, Dionysius in Syracuse, and likewise others, from popular leadership.

As we said,[220] then, kingship is an order that is in accord with aristocracy. For it is in accord with worth, whether this is individual virtue or that of family, or in accord with benefactions, or these together with capacity. For all those who obtained

219. Sent to attend sacred games and to consult oracles on behalf of their city.
220. 1310b2–3.

this office either had benefited, or had the capacity to benefit, their cities or nations. Some, like Codrus, saved their people from enslavement in war; others, like Cyrus, set them free; others settled or acquired territory, like the kings of the Spartans, Macedonians, and Molossians.

A king wishes to be a guardian, in order that property owners suffer no injustice and the people no wanton aggression. But tyranny, as has often been said, looks to no **1311ᵃ1** common [advantage] except for the sake of private benefit. And the aim characteristic of tyranny is the pleasant, while the aim characteristic of kingship is the noble. That is also why it is characteristic of a tyrant to want to get more wealth, and of a king to get more of the things pertaining to honor. Also, a king's bodyguard consists of citizens, while a tyrant's consists of foreigners.

It is evident, then, that tyranny has the evils both of democracy and of oligarchy. From oligarchy comes its taking wealth to be its end (for, in fact, only in this way can the tyrant possibly maintain his bodyguard and his luxury), and its mistrust of the multitude. That is why, in fact, tyrants deprive them of weapons, and why mistreating the mob, driving them out of the city proper, and dispersing them is common to both constitutions, to oligarchy as well as to tyranny. From democracy on the other hand comes its making war on the notables, its destroying them by both covert and overt means, and its exiling of them as rivals in the craft [of ruling] and impediments to its rule. For it is from the notables that conspiracies arise, since some of them wish themselves to rule, and others not to be enslaved. Hence too the advice that Periander gave to Thrasybulus when he cut down the tallest ears of wheat, that it is always necessary to do away with the citizens who exhibit a superiority.[221]

As has pretty much been said, then, one should consider the starting-points of change both in the constitutions [mentioned] and in monarchies to be the same; for it is because of injustice, because of fear, and because of contempt that many of those who are ruled attack monarchies—in the case of injustice, it is mostly because of wanton aggression, but sometimes too because of the deprivation of private property. The ends sought are also the same there as in tyrannies and kingships; for monarchs possess greatness in wealth and in honors of office, which everyone desires.

Some attacks are directed against the body of the rulers, others against the office. Those caused by wanton aggression are directed against the body. And though wanton aggression is of many sorts, each of them is a cause of anger; and most angry people attack for the sake of revenge, not for the sake of attaining superiority. For example, the attack on the Pisistratids took place because they abused Harmodius' sister and showed contempt for Harmodius himself (for Harmodius attacked because of his sister, and Aristogeiton because of Harmodius). People plotted against Periander, tyrant of Ambracia, because once while drinking with his boyfriend, Periander asked whether he was pregnant by him yet. Philip was attacked by Pausanias because **1311ᵇ1** he allowed him to be treated with wanton aggression by Attalus and his coterie.

221. 1284ᵃ26–33.

Amyntas the Little was attacked by Derdas because he boasted of having deflowered him. The same is true of the attack on Evagoras of Cyprus by a eunuch; he felt he was treated with wanton aggression because Evagoras' son had taken away his wife and killed the king.

Many attacks have also occurred because of the shameful treatment of the bodies of others by certain monarchs. The attack on Archelaus [II] by Crataeas is an example; for Crataeas always felt burdened by the sexual favors [he required], so that even a lesser pretext would have been enough, or perhaps he did it because Archelaus did not give him one of his daughters in marriage, though he had agreed to do so. (Instead, when hard-pressed in the war against Sirras and Arrabaeus, he gave his elder daughter to the king of Elimeia and the younger one to his own son Amyntas, thinking that this would be likely to prevent Amyntas from quarreling with his son by Cleopatra.) In any case, the starting-point of Crataeas' estrangement was that he felt burdened by his sexual intercourse with Archelaus. And Hellanocrates of Larissa joined him in the attack for the same reason. For because Archelaus deflowered him and then persistently refused to return him to his home as promised, he thought that the king's intercourse with him was due to wanton aggression rather than to sexual appetite. Python and Heracleides of Aenus, on the other hand, killed Cotys to avenge their father, while Adamas revolted on the grounds of wanton aggression, because he had been castrated by Cotys when he was a boy.

Many people too, angered because their bodies have been tormented by blows, have killed or tried to kill, on the grounds of being treated with wanton aggression, even those who held office or were associated with kingly dynasties. For example, when the Penthilids of Mytilene went around beating people with clubs, Megacles and his friends attacked and killed them.[222] Later, Smerdes killed Penthilus because he had beaten him and dragged him away from his wife. Decamnichus became leader of the revolt against Archelaus,[223] being the first to incite his adversaries—the cause of his anger was that Archelaus had handed him over to the poet Euripides for flogging (Euripides was enraged by a remark made about his bad breath). Many others have been killed or plotted against due to causes such as these.

Similar attacks also occur because of fear; for this, as we saw,[224] is a cause of change in monarchies and constitutions too. For example, Artapanes killed Xerxes, fearing a charge in connection with the murder of Darius, because he hanged him without being ordered to do so by Xerxes, thinking that Xerxes, not remembering on account of his dining, would pardon him.

Other attacks are because of contempt, as when someone saw Sardanapalus carding wool with the women, if what the storytellers say is true (though if this is not true of him, it might well be true of someone else). And Dion attacked Dionysius

222. Sometime before 650 BC.
223. In 399 BC.
224. 1311a25.

the Younger because of contempt, when he saw that the citizens shared his feelings, and that Dionysius himself was always drunk.[225] Even some friends make an attack because of contempt; for because they are trusted, they feel contempt, thinking that they will not be discovered. And those who think they have the power to take over the rule attack because of contempt in a way; for because of their power, and the contempt for danger that their power gives them, they readily make their attempt. Thus generals attack monarchs. For example, Cyrus attacked Astyages because of contempt both for his mode of life and for his power, because his power had declined and, as for himself, he was living in luxury. And Seuthes the Thracian attacked Amadocus while he was his general.

Others attack monarchs from several of these motives—for example, both because of contempt and because of profit—as Mithridates attacked Ariobarzanes. {Attempts of this sort are made mostly by those of a bold nature, who are assigned to military office by monarchs; courage possessed of power is boldness. And it is because of both of these that people attack, thinking that they will easily prevail.}[226]

With those who attack because of love of honor, however, the cause operates in another way that is beyond those previously discussed. For, although some attack tyrants because they see great profit and high office in store for themselves, this is not why someone whose attack is motivated by love of honor deliberately chooses to take the risk. It is rather that, while the former attack due to the causes mentioned, the latter, just as they would undertake any other extraordinary action through which people become famous and notable in the eyes of others, in the same way attack monarchs because they wish to gain not a monarchy but a reputation. But then those who are impelled by this sort of cause are, to be sure, very few in number; for it presupposes giving no thought to their own preservation should the action not succeed. They must follow, then, the supposition of Dion, which is not easy for most people to do; for accompanied by a few followers he marched against Dionysius, saying that whatever point he was able to reach, he would be satisfied to have shared that much in the action, and that if, for example, he were killed just after having set foot on land, that death would be a noble one for him.

One way that a tyranny is destroyed, just as each of the other constitutions is as well, is from the outside, if there happens to be a stronger constitution contrary to it (for the wish to destroy a tyranny will clearly be present, because of the contrariety between the deliberate choices of the two constitutions, and because all people do what they wish when they have the power). The constitutions that are contrary—in the way "potter is to potter," as Hesiod says[227]—are democracy (for the ultimate democracy is in fact a tyranny) and kingship or aristocracy, because of the contrariety between these constitutions. That is why the Spartans overthrew a large number of

225. The story is continued at 1312^{a}33–39.

226. This sentence should perhaps follow the word "drunk" at 1312^{a}6.

227. *Works and Days* 25.

tyrannies,[228] as did the Syracusans during the time when they were governed in a good way.[229]

Another way a tyranny is destroyed is from within itself, when those sharing in it engage in faction, as happened in the tyranny of those around Gelon and, in our own time, in the tyranny of those around Dionysius. The tyranny of Gelon was destroyed when Thrasybulus, the brother of Hiero, acting the part of popular leader for Gelon's son, impelled him toward pleasures, in order that he himself might rule. The family joined together to destroy not the entire tyranny, but Thrasybulus. But those who joined with them seized the opportunity and expelled all of them. Dion, who was related by marriage to Dionysius, marched against him, won over the people, and expelled him, but was himself killed afterward.

There are two causes due to which people mostly attack tyrannies, hatred and contempt. But though one of these—hatred—always attaches to tyrants, it is from contempt that many of their overthrows come about. A sign of this is that (one might almost say) most of those who won the office of tyrant held on to it, while all their successors lose it straightaway. For living lives of indulgence, they readily became contemptible and gave others ample opportunity to attack them. And anger should also be taken as a part of hatred; for in a way it gives rise to the same sorts of actions. Often, in fact, it is more conducive to action than hatred, for angry people attack more vehemently because feeling does not make use of rational calculation. It happens that people are particularly led by their spirited feelings because of wanton aggression—which was the cause of the overthrow of the tyranny of the Pisistratids as well as of many others. But hatred employs rational calculation more than anger does; for anger involves pain, so that it is not easy to rationally calculate, while hatred does not involve pain.

To speak summarily, the causes that we said destroy unmixed or ultimate oligarchies and ultimate democracies must also be counted as destroying tyranny; for these in fact are divided tyrannies.

Kingship is destroyed least by outside factors, which is also why it is long-lasting. The sources of its destruction in most cases come from within itself. It is destroyed in two ways: in one, when those who share in the kingship engage in faction, and
1313a1 in another way when the kings try to manage affairs in a more tyrannical fashion, claiming that they deserve to have control in too many areas and contrary to the law. Kingships no longer arise now, but if any do happen to occur, they tend more to be tyrannical monarchies. This is because kingship is rule with the voluntary consent of the ruled and has control of more important matters. But now there are numerous men of equal quality and none so superior as to measure up to the magnitude and worth of the office of king. So because of this people do not voluntarily put up with

228. Including, among many others, one in Athens.
229. I.e., while they had an aristocracy (466–413 BC).

this sort of rule. And if someone comes to rule through force or deceit, this already seems to be tyranny.

In the case of hereditary kingships, there is something besides the factors already mentioned that should be held to be a cause of their destruction, that many hereditary kings easily become objects of contempt and (even though they do not possess tyrannical power but honorable kingly office) commit wanton aggression. For their overthrow was easy. For when the ones ruled do not wish it there will straightaway not be a king, but there will be a tyrant, even when they do not wish it.

Monarchies are destroyed, then, due to these and other such causes.

5.11
Preserving Kingships and Tyrannies

It is clear that monarchies are, simply speaking, preserved by the contrary causes, and kingships in particular by drawing them toward greater moderation. For the fewer areas over which kings have control, the longer must their whole office endure; for they themselves become less like masters, more equal in their characters, and less envied by those they rule. That is why, in fact, the kingship of the Molossians lasted a long time, and that of the Spartans as well. In the latter case it was because the office was divided into two parts from the start, and again because Theopompus, besides moderating it in other ways, in addition put in place the office of the overseers. By diminishing the power of the kingship he increased it in terms of duration, so that in a way he made it greater, not lesser. Just this, in fact, is precisely what they say he replied to his wife when she asked him whether he was not ashamed to hand over a lesser kingship to his sons than the one he had inherited from his father: "Certainly not," he said, "for I am handing over one that will be longer lasting."

Tyrannies are preserved in two entirely contrary ways. One of them is traditional and is the way most tyrants exercise their rule. Many of these are said to have been established by Periander of Corinth, but many of this sort may also be seen in the Persian way of ruling. These include both the one mentioned some time ago[230] as tending to preserve tyranny (to the extent that it can be), cutting down the superior men and doing away with the self-confident ones. Also, not allowing communal messes, political clubs, education, and other things of that sort. Guarding against **1313b1** everything that tends to engender two things, self-confidence and mutual trust. Not allowing places of leisure and other leisurely gatherings, and doing everything to ensure that all people are as ignorant of each other as possible (for knowledge tends to produce mutual trust). Also, requiring those residing in the city to be always in [public] view and to pass their time at the palace gates (for that way the actions they do will be hard to keep secret and they will be habituated to think humble thoughts

230. 1284a26–33, 1311a8–22.

by always doing slavish service). Also, imposing all the other restrictions of a similar nature that are found in Persian and barbarian tyrannies (for they are all capable of producing the same effect).

Another is trying to let nothing done or said by any of his subjects escape notice, but to retain spies, like the so-called women informers of Syracuse, or the eavesdroppers that Hiero sent to every meeting or gathering (for people speak less freely when they fear the presence of such spies, and if they do speak freely, they are less likely to go unnoticed). Another is to slander people to each other, setting friends against friends, the people against the notables, and the rich against the rich themselves.

It is also tyrannical to impoverish the ruled, so that they cannot afford a militia and[231] are so occupied with doing their daily work that they lack the leisure for plotting. The pyramids of Egypt, the Cypselid monuments, the construction of the temple of Olympian Zeus by the Pisistratids, and the works on Samos commissioned by Polycrates are all examples of this (for all these things can produce the same result, lack of leisure and poverty for the ruled). And there is taxation, as in Syracuse, when, during the reign of Dionysius, taxation ate up a person's entire estate in five years. A tyrant also engages in warmongering in order that his subjects will lack leisure and keep being in need of a leader. And while a kingship is preserved by its friends, it is a mark of a tyrant to distrust his friends most of all, on the supposition that while all his subjects wish [to overthrow him], these are above all capable of doing so.

And the things that occur in the ultimate democracy are all characteristic of a tyranny, the dominance of women in matters concerning the household, in order that they may report on the men, and the license of slaves due to the same cause; for slaves and women not only do not plot against tyrants but, if they prosper under them, are necessarily well-disposed toward tyrannies and toward democracies as well; for the people too wish to be a monarch. That is why a flatterer is honored in both constitutions—in democracies, the popular leader (for the popular leader is a flatterer of the people), in tyrannies, those who are obsequious in their dealings with the tyrant, which is precisely the work of flattery. And in fact it is because of this that tyranny is a lover of wickedness. For tyrants in fact delight in being flattered. But no one would do this who had free thoughts. On the contrary, decent people show friendship, or [at least] do nor flatter. Also, the wicked are useful for wicked things, for "nail is driven out by nail," as the proverb goes. Also, it is characteristic of a tyrant not to delight in anyone who is dignified or free (for a tyrant thinks that he alone deserves to be like that, while anyone who is a rival in dignity or in being free deprives tyranny of its superiority and its element of mastership, and so tyrants hate him as a threat to the rule). Also, it is characteristic of a tyrant to have foreigners rather than citizens as dinner guests and companions, on the supposition that the latter are hostile to him, while the former do nothing to oppose him.

231. Reading μήτε.

These and similar things are characteristic of tyranny and preserve its rule, but there is no depravity that it leaves out. And (one might almost say) all of these fall into three forms. For tyranny aims at three things. The first is for the ruled to think small (for a small-souled person would plot against no one). The second is for them to distrust each other (for a tyranny will not be overthrown until some people trust each other). That is also why tyrants make war on decent people, on the supposition that they are harmful to their rule, not only because they refuse as something unworthy to be ruled as by a master, but also because they are trusted both among themselves and among others, and do not inform on each other or on anyone else. The third aim is incapacity to take any actions (for no one tries to do what is impossible, and so no one tries to overthrow a tyranny if he lacks the power). The defining marks of tyranny, then, to which the wishes of tyrants may be led back, are these three; for a person might lead all the things characteristic of tyranny back to these three hypotheses: that its subjects not trust each other, that they have no power, and that they think small.

This, then, is one way in which the preservation of tyrannies comes about. The other involves precautions that are pretty much the contrary of those just discussed. And one may grasp it by considering the destruction of kingships. For just as one way to destroy a kingship is to make its rule more tyrannical, so one way to preserve a tyranny is to make it more like a kingship, provided that one thing only is safeguarded, power, so that the tyrant can rule not only subjects who wish it but also ones who do not wish it. For if he gives this up too, he also gives up being a tyrant. But while this must remain as a hypothesis, as regards the other things, he should do some and seem to do others, acting the part of a king in a noble manner.

First, then, he should seem to take thought for public funds. He should not squander them on gifts that enrage the multitude, as when they take from people who are laboring and toiling in penury, and spend lavishly on courtesans, foreigners, and artists. He should also render an account of funds received and expended, which is precisely what some tyrants in the past have done (for in this way, he will give the impression of managing the city like a household manager, not like a tyrant). And he should not be afraid of running short of funds, since he has control of the city. But—at any rate, for those tyrants who are often away on foreign campaigns—it is more advantageous to follow this policy than to amass a great hoard of wealth and leave it behind; for those who guard the city will be less likely to attack his interests. Tyrants on a foreign campaign have more to fear from such guards, indeed, than from the citizens; for the citizens accompany him, while the guards stay behind. Next, it should appear that taxes and public services are for the purposes of administration, and, should he need them, for use in times of war, and, in general, a tyrant should present himself as a guardian and treasurer of the public funds, not of his own private ones.

Also, he should appear not harsh but dignified, and further, of such sort that those who meet him feel not fear, but rather awe. But this is not easily achieved if

he is contemptible. That is why, even if a tyrant neglects the other virtues, he must cultivate military virtue and make himself a reputation for it.

Further, not only should he himself avoid being seen behaving with wanton aggression toward any of those he rules, whether boys or girls, but neither should any of those around him. Likewise, the women of his household should also be respectful toward other women, as many tyrannies have also been destroyed because of the wanton aggression of women. As regards indulgence in bodily pleasures, he should do the contrary of what certain tyrants do now (for they not only do this as soon as it is dawn, and continue for many days, but they also wish to be seen doing so by others, in order that they may be admired as happy and blessed). Yet above all in such things a tyrant should be moderate, or, failing that, he should at least avoid exhibiting his indulgence to others (for it is not the sober man who is readily attacked or despised, but the drunk one, and not the one who is wide awake, but the one who is drowsy).

Indeed, a tyrant must do the contrary of pretty much all the things mentioned before[232] (for he must establish and adorn the city as if he were a steward, not a tyrant).

Further, a tyrant should always be seen to be outstandingly serious about matters concerning the gods (for people are less afraid of suffering something contrary to the law at the hands of such people, and if they think their ruler is a god-fearing man, and one who takes thought of the gods, they plot against him less, on the supposition that he has even the gods on his side). In appearing to be someone of this sort, however, the tyrant must avoid silliness.

A tyrant should so honor those who prove to be good in any area that they would never expect to be more honored by citizens living under their own laws. And he should bestow such honors himself, but punishments should be left to other officials and to the courts.

It is a precaution common to every sort of monarchy, however, not to make any one person great, but if indeed one, then several (for they will keep an eye on each other). And if it happens to be necessary to make one person great, at least it should not be someone of bold character (for someone with such a character is most ready to attack in connection with every sort of action). And if it seems necessary to remove someone from power, his prerogatives should be taken away gradually, not all at once.

Further, a tyrant should refrain from every sort of wanton aggression, and from two in particular,[233] corporal punishment and the sort directed against the youth. He should take this precaution above all in the case of honor-lovers; for while money-lovers resent contemptuous acts affecting their property, honor-lovers and decent human beings resent those involving dishonor. That is why he should either not treat people in these ways or else be seen to punish like a father, not out of contempt, and to engage in intercourse with young people due to sexual causes, and not as if it were

232. 1313a34–b32.

233. Reading δυοῖν.

a prerogative of his office. In general, he should compensate what are believed to be dishonors with greater honors.

Among those who make attempts to destroy his body, a tyrant should most fear, and take the greatest precautions against, those who by deliberate choice do not care about preserving their lives after destroying his. That is why he should be especially wary of people who think that he has been wantonly aggressive toward them, or toward those they happen to care about; for people who attack out of spirit are careless of themselves, and, as Heraclitus said, "Spirit is a hard enemy to fight, because it pays with soul."[234]

Since cities consist of two parts, poor human beings and rich ones, it is best if both suppose that they are preserved because of the [tyrant's] rule, and that neither is unjustly treated by the other in anything. But whichever of them is the stronger these are the ones he should most attach to his rule, so that, with this support for his affairs, there will be no need for the tyrant to free slaves or confiscate weapons; for either one of the two parts added to his power will be enough to make them stronger than the attackers.

It is superfluous to discuss each particular thing of this sort; for their aim is evident. A tyrant should appear to his subjects not as a tyrant but as a household manager and a kingly man, not as an appropriator [of other people's things] but as a steward. He should also appear to pursue the moderate things of life, not the excessive ones, maintaining close relations with the notables, while acting the part of a popular leader for the many. For as a result, not only will his rule necessarily be nobler and more enviable by ruling over better people, who have not been humbled, and doing so without being hated and feared, but also his rule will be longer lasting, and, in addition, he himself, in his own character, will either be nobly disposed to virtue or else half good, not wicked but half wicked.

5.12[235]
Long-Lasting Tyrannies; Plato on Political Change

And yet the shortest-lasting of all constitutions are oligarchy and tyranny. For the longest-lasting tyranny was that of the sons of Orthagoras and Orthagoras himself in Sicyon.[236] It lasted a hundred years. The cause of this was that they treated their subjects moderately and were slaves to the laws in many areas; and, because Cleisthenes was skilled in warfare, he was not easily despised; and because in many ways, by their acts of concern, they acted like popular leaders. It is said, at any rate, that Cleisthenes

234. B85 DK.

235. Because this chapter omits the tyranny of Dionysius I, which lasted more or less for fifty years, and somewhat intrusively mentions oligarchy (1315b12) in a discussion devoted to monarchy, some scholars have doubted its authenticity.

236. Founded in 670 BC.

gave a crown to the judge who denied him victory in a competition; some even say that the seated figure in the marketplace is a statue of the man who gave the verdict. They say too that Pisistratus once allowed himself to be summoned for trial before the Areopagus.

The second-longest tyranny was that of the Cypselids in Corinth,[237] which lasted seventy-three years and six months; for in fact Cypselus was tyrant for thirty years, Periander for forty and a half, and Psammeticus, the son of Gorgus, for three. The causes of its lasting are also the same; for Cypselus himself was a popular leader and went without a bodyguard throughout his rule, while Periander, though he became tyrannical, was skilled in warfare.

The third-longest was that of the Pisistratids in Athens.[238] But it was not continuous; for Pisistratus, while he was a tyrant, went into exile twice, so that in a period of thirty-three years he was tyrant for seventeen. His sons ruled for eighteen years, so that the tyranny lasted for thirty-five years altogether.

The longest-lasting of the remaining tyrannies was the one associated with Gelon and Hiero at Syracuse.[239] Yet even this did not last long, but needed two more years to last for altogether twenty years. For Gelon was tyrant for seven and died in the eighth; Hiero for ten. Thrasybulus was expelled in his eleventh month. But the majority of tyrannies have all been quite short-lasting.

As regard constitutions and as regards monarchies, then, the sources of their destruction, and also their preservation, have now pretty much all been stated.

1316a1 In the *Republic*[240] things are said by Socrates about [constitutional] changes, but in fact what is said is not correct. For in the case of the first and best constitution he does not discuss the change special to it. For he claims that its cause is that nothing remains as it is, but that everything undergoes a sort of cyclical change, and that the starting-point of this lies in the elements four and three, which "married with five, give two harmonies," whenever, as he says, the number of this figure becomes cubed. His supposition is that nature sometimes produces people who are base and stronger than education. Perhaps he is not wrong in saying this (for there may be some people who are uneducable and cannot become excellent men). But how could this sort of change be any more special to the constitution he says is best than common to all the others and to everything that comes to be? And is it because of time, due to which, as he says, everything changes, that even things that did not start to exist at the same time change at the same time? If something comes to be on the day before the completion of the cycle, for example, does it still change at the same time as everything else?

In addition to this, what causes the best constitution to change into a constitution of the Spartan sort? For all constitutions more often change into their contraries than

237. Founded c. 657 BC.
238. 1305a23–24, 1311a36–39, 1313b23.
239. 1302b31–33, 1303a38–b2, 1312b9–17.
240. 545c–569c.

into the neighboring one. And the same argument also applies to the other changes. For he says that the Spartan constitution changes to an oligarchy, then from oligarchy to a democracy, then from democracy to a tyranny. And yet change may also occur in the contrary direction, for example, from democracy to oligarchy, and this happens even more often than from democracy to monarchy.

Further, as regards tyranny, he does not tell us whether there will or will not be a change, what will cause it to change [if it does], or what sort of constitution it will change into. The cause of this is that he could not easily have said; for it is indeterminate, since, according to him, it should change into the first or best constitution, for in this way the change would be continuous and in a circle. But tyranny also changes into another tyranny, as the constitution at Sicyon changed from the tyranny of Myron to that of Cleisthenes; into oligarchy, like that of Antileon in Chalcis;[241] and also into democracy, like that of Gelon and his family at Syracuse; and into aristocracy, like that of Charilaus in Sparta and the one in Carthage.[242]

Change also occurs from oligarchy to tyranny, as happened in Sicily with pretty much the majority of the ancient oligarchies: in Leontini, to the tyranny of Panaetius; in Gela, to that of Cleander; in Rhegium, to that of Anaxilaus; and similarly in many other cities.

It is also absurd to think that a constitution changes into an oligarchy because the officeholders are money-lovers and wealth-acquirers, and not because those who are far superior in property holdings think it unjust for those who possess no property **1316[b]1** to share equally in the city with those who do possess it. In many oligarchies, in fact, officeholders are not only not allowed to acquire wealth, but there are laws to prevent it. On the other hand, in Carthage, which is governed democratically,[243] the officials do engage in acquiring wealth, and it has not yet undergone change.

It is also absurd to say that an oligarchic city is really two cities, one of the rich and one of the poor. For why is this any more true of it than of the Spartan constitution, or any other constitution where the citizens do not all possess an equal property or are not all similarly good men? And even when no one becomes any poorer than he was, constitutions still undergo change from oligarchy to democracy, if the poor become a majority, or from democracy to oligarchy, if the rich part happens to be stronger than the multitude, and the latter are negligent, while the former turn their thought toward [change].

Although there are in fact many causes of changes, Socrates states but one, that by leading a profligate life, and borrowing excessively and paying interest, they become poor—as if all or most of the citizens were rich at the start. But this is false. Rather, when men of the leading group lose their properties, they stir up change; but when

241. In apparent conflict with 1304[a]29–31.
242. In apparent conflict with 1272[b]24–33.
243. In apparent conflict with 1273[a]6–13, 1293[b]14–16.

some of the others do so, nothing terrible happens. And even when change does occur, it is no more likely to result in a democracy than in some other constitution.

Further, if people have no share in the honors of office or are treated unjustly or with wanton aggression, they engage in faction and change constitutions, even if they have not squandered all their property because it is open to them to do whatever they wish (the cause of which, Socrates says, is too much freedom).

Although there are many sorts of oligarchies and democracies, Socrates discusses their changes as if there were only one of each.

BOOK 6

6.1
Mixed Constitutions and Forms of Democracy

How many different sorts there are of the deliberative and controlling element of the constitution, then, the ways of ordering offices and courts, which sort has been ordered with a view to which sort of constitution, and further, as regards the destruction and preservation of constitutions, from what sources and due to what causes they come about, were stated previously.[244]

But since it turned out that there are several forms of democracy and likewise of the other constitutions, it will be well to investigate whatever remains to be said about these, and to determine the mode that properly belongs, and is advantageous, to each of them. Further, the combinations of all the modes of ordering the things we **1317a1** mentioned must be investigated; for these, when coupled, make constitutions overlap, resulting in oligarchic aristocracies and democratically inclined polities. I mean those couplings[245] that should be investigated, but up to now have not been—for example, where the deliberative part and the part that is concerned with the election of officials are ordered oligarchically, but the part that is concerned with the courts is aristocratic, or where the part that is concerned with the courts and the deliberative part are oligarchic, but the part that is concerned with the election of officials is aristocratic, or where, in some other way, not all the parts properly belonging to the constitution are combined.

Which sort of democracy is fitting for which sort of city, and likewise which sort of oligarchy for which sort of multitude, and which of the remaining constitutions is advantageous for which, were spoken about previously. Nonetheless, since one should make clear not only which sort of constitution is best for a city, but also how it and the other sorts should be established, let us briefly go through this. Let us

244. 4.14–16, 5.1–12.

245. These hybrid constitutions are not discussed in the extant *Politics*.

speak first about democracy; for that will at the same time make evident the opposite constitution, the one that some people call "oligarchy."

To carry out this methodical inquiry, one must grasp all the features that are democratic and that are believed to go along with democracies; for it is as a result of the way these are combined that the various forms of democracy arise, and more than one different sort of each. For there are two causes for there being several democracies. The first is the one mentioned previously,[246] that there are different sorts of people (for there is the farming multitude, the unrefined one, and that manual laboring one, and when the first of these is added to the second, and the third again to both of them, this creates a difference not only with respect to the democracy's being better or worse, but even with respect to its not being the same [sort of democracy]). But the second is the one we are speaking about now. For the features that go along with democracy and are believed to properly belong to this constitution, when they are [differently] combined, make democracies differ; for with one sort a few of these features will go along, with a second more, and with a third all of them. But it will be useful to gain knowledge of each of them, whether for the purpose of establishing whichever of these sorts of democracy one happens to wish for, or for the purpose of rectifications. For those who are putting in place a constitution seek to combine all the features that properly belong to its hypothesis, although they err in doing so, as was stated previously[247] in our discussions of the destructions and preservations of constitutions.

Now let us discuss the axioms and characters [of the various forms of democracy] and what it is they aim at.

6.2
The Hypothesis of Democracy

The hypothesis of the democratic constitution is freedom (for people usually say that only in this constitution do they share in freedom; for all democracies, they say, aim at this). One sort of freedom is ruling and being ruled in turn. For in fact democratic justice is equality in accord with number, not in accord with worth. But if this is what is just, then the multitude must be in control, and whatever seems so to the majority, this must be the end and this must be what is just; for they say that each of the citizens should have an equal share, with the result that in democracies the poor happen to have more control than the rich; for they are the majority, and what seems so to the majority is in control. This, then, is one sign of freedom, which all democrats take as a defining mark of their constitution. Another one is to live as one wishes. For this, they say, is the work of freedom, if indeed that of slavery is not to live as one wishes. This,

246. $1291^{b}14–28$, $1292^{b}22–1293^{a}34$, $1296^{b}24–31$.
247. $1309^{b}18–35$.

then, is the second defining mark of democracy. From it arises the demand not to be ruled, best of all to be ruled by no one, or, failing that, to rule and be ruled in turn. In this way the second goal contributes to freedom in accord with equality.

When these things are presupposed and the starting-point is of this sort the following features are democratic: Having all choose officials from all. Having all rule each and each in turn rule all. Having all offices, or all that do not require experience or craft knowledge, filled by lot. Having no property assessment for the offices or as low a one as possible. Having no office, or few besides military ones, held twice or more than a few times by the same person. Having all offices or as many as possible be short-term. Having all, or[248] bodies chosen from all, judge all cases, or most of them and the ones that are most important and involve the most control, such as those having to do with the inspection of officials, the constitution, or private transactions. Having the assembly control everything or the most important things, but having no office control any or as few as possible. Among the offices, the most democratic is the council, when there is ample pay for no one; for where there is ample pay, even this office is stripped of its power; for when the people are well paid, they take all judgments into their own hands (as was said previously in the methodical inquiry before this one[249]). Having pay provided, preferably for all, for the assembly, courts, and public offices, or, failing that, for service in the offices, courts, council, and the assemblies with full control,[250] or for those offices that require their holders to share a communal mess. Further, since oligarchy is defined by family, wealth, and education, their contraries (lack of breeding, poverty, and lack of refinement) are held to be characteristically democratic. Further, it is democratic to have no office be permanent; **1318a1** and if such an office happens to survive an ancient change of constitution, at any rate, to strip it of its power and make it be filled by lot instead of election.

These, then, are the features common to democracies. And from the justice that is agreed to be democratic, which consists in everyone having equality in accord with number, comes what is believed to be most of all democracy and rule by the people. For equality consists in the poor neither ruling more than the rich nor being alone in control, but in all ruling equally on the basis of equality in accord with number; for in that way they would acknowledge that both equality and freedom are present in the constitution.

6.3
Democratic Equality

The next issue is the puzzle that arises as to how they will achieve this equality. Should they divide the assessed property so that that of five hundred citizens equals that of a thousand others, and then give equal power to the thousand as to the five hundred?

248. Reading ἢ.
249. 1299b38–1300a4.
250. *Ath*. 43.4.

Or is this not the way to set up equality in accord with this? Should they instead divide as before, then take an equal number of citizens from the five hundred as from the thousand and give them control of the elections and the courts? Is this, then, the constitution that is most just in accord with democratic justice? Or is it rather the one in accord with the quantity [of people]? For democrats say that this is just, whatever seems so to the greater number, while oligarchs say that it is whatever seems so to those with the most property; for they say that it is in accord with quantity of property that it should be judged. Both views involve inequality and injustice; for if justice is whatever the few believe it to be, it is tyranny (for if one person has more than the others who are rich, then, in accord with oligarchic justice, he is just in ruling alone). On the other hand, if justice is what the majority in accord with number believe, they will commit injustice by confiscating the property of the rich and few (as was said previously[251]).

What sort of equality there might be, then, that both would agree on must be investigated on the basis of the definitions of justice they both give. For they both say that the belief of the majority of the citizens should be in control. Let this stand, then, though not fully. Rather, since as it happens there are in fact two parts of which a city is composed, the rich and the poor, let whatever is the belief of both, or of a majority of both, have control. But if their beliefs are contrary, let that of the majority (that is, of those whose assessed property is [collectively] greater) prevail. For example, if there are ten rich citizens and twenty poor ones, and contrary beliefs are held by six of the rich and fifteen of the poorer ones, four of the rich having been added to the poor, and five of the poor to the rich, then let whichever group's property assessment is greater when the properties of both the rich and poor on each side are added together have control. But if the amounts happen to be equal, let it be considered a common puzzle, as it is now when the assembly or the court is split; for let it be settled by lot or let something else of that sort be done. **1318**[b]**1**

But even if it is very difficult to discover the truth about equality and justice, still this is easier to attain than to persuade the people who have the power to get more; for the weaker always seek the equal and the just, while the strong give no thought to them.

6.4
Ranking Democracies

Among the four sorts of democracy, the first in order is the best, as was said in the discussions before these.[252] It is also the most ancient of them all. And I call it "first" in the very same way that one might distinguish peoples. For the best people is the

251. 1281[a]14–28.
252. 1291[b]30–1292[a]38, 1292[b]25–1293[a]10.

sort that farms, and so it is also possible to create a democracy where the multitude live by cultivation or by herding. For because they do not have much property, they lack leisure and cannot attend meetings of the assembly frequently. And because they do not have[253] the necessities, they spend their time on their works and do not have an appetite for other people's property. Indeed, working is more pleasant to them than engaging in politics and holding office, where large gains are not to be had from office. For ordinary people seek profit more than honor. A sign of this is that they used to put up with the ancient tyrannies, and continue to put up with oligarchies, so long as no one prevents them from working or takes anything away from them; for some of them quickly become rich, while the others [at least] do not live in poverty. Further, having control of the election and inspection of officials fulfills their need, if they do have any love of honor. In fact, among some peoples, even if the multitude do not share in the election of officials, but electors are chosen from all the citizens by turns, as in Mantinea,[254] still, if they have control of deliberation, they are content. This scheme too should be considered a shape of democracy, as it was once at Mantinea.

That is why, then, in the democracy that was mentioned, it is both advantageous and customary for all the citizens to elect and inspect officials and sit on juries, but for the holders of the most important offices to be elected, and to be from those with a certain amount of assessed property (the higher the office, the higher the assessment), or alternatively for officials not to be elected on the basis of property assessments at all, but of their capacities. People who are governed in this way are necessarily governed well (for the offices will always be in the hands of the best, since the people will wish it and not envy the decent). And to the decent and notable people this ordering is satisfactory, for they will not be ruled by their inferiors, and will rule justly because the others have control of the inspection of officials. For to be dependent, and not to be able to do whatever one believes [to be good], is advantageous; for the license to do whatever one likes leaves one defenseless against the base element that exists in every human being. So the necessary result, which is precisely the one that is most beneficial in constitutions, is that the decent people rule while being kept from error, and the multitude are in no way shortchanged.

It is evident, then, that this is the best of the democracies, and also what cause this is due to, that the people are of a certain sort. And with a view to establishing a farming people, some of the laws laid down in many cities in ancient times are very useful—for example, wholly prohibiting the ownership of more than a certain amount of land, or else more than a certain amount situated between a given place and the city proper or the city. And there used to be legislation in many cities (at any rate in ancient times) forbidding even the sale of the first allotments of land, and also one, said to derive from Oxylus, with a similar sort of effect, forbidding lending

253. Rejecting the seclusion of μὴ.
254. 1304a25–27.

against any portion of each person's land. As things stand, however, one should also attempt rectification by using the law of the Amphytaeans, as it too is useful with a view to what we are speaking about; for they, though numerous but having little land, are nonetheless all engaged in farming; for property assessments are not of whole estates but in accord with such small subdivisions of them that even the poor can exceed the assessment.

After the multitude of farmers, the best people consist of herdsmen, who get their living from livestock; for herding is in many respects much the same as farming, and with a view to military actions, they are above all well prepared in their habits, and they have usable bodies and are able to live in the open. The other multitudes, of which the remaining sorts of democracies are composed, are pretty much all a lot more base than these; for their mode of life is base, and there is no element of virtue involved in the work to which the multitude of unrefined people, tradesmen, and hired laborers put their hand. Further, because they wander around the marketplace and city proper, (one might almost say) this entire kind can easily attend the assembly. Farmers, on the other hand, because they are scattered throughout the countryside, neither meet nor have the same need for this sort of meeting. And where the situation of the territory is such that the countryside is widely separated from the city, it is easy to create a democracy that is good and [like] a polity; for the multitude are compelled to make their settlements out in the countryside areas, so that, even if there is a whole mob that frequents the marketplace, one should simply not hold assemblies in democracies without the multitude from the countryside.

How, then, the best or first democracy should be established has been stated. But how the others should be established is also evident. For they should deviate stepwise [from the best], always excluding a worse multitude.

The ultimate democracy, because everyone has a share, is not one that every city **1319**^{b}**1** can tolerate, nor can it easily endure if its laws and customs are not well composed. (What factors cause the destruction of this and other constitutions have pretty much all been stated previously.[255]) With a view to putting in place this sort of democracy and making the people strong, the leaders usually admit as many as possible to citizenship, and make citizens not only of the legitimate children of citizens but also of the illegitimate ones, and those descended from citizens on only one side (I mean their mother's or their father's); for this entire element more properly belongs to this sort of democracy. This, then, is how popular leaders usually establish a constitution of this sort. Yet they should accept additional citizens only up to the point where the multitude outnumber the notables and those in the middle, and not go beyond this; for when they do overshoot it, they make the constitution more disorderly and provoke the notables to such an extent that they find the democracy hard to endure—which is precisely what was the cause of the faction at Cyrene; for a wicked element gets overlooked when it is small, but as it grows larger it is more before one's eyes.

255. 5.5.

Further, also useful with a view to a democracy of this sort are the establishments that Cleisthenes used in Athens[256] when he wished to increase the power of the democracy, and that those setting up the democracy used at Cyrene. For different and more numerous tribes and clans should be created, private cults should be absorbed into a few public ones, and every subtlety devised to mix everyone together as much as possible and break up their previous associations.

Further, all tyrannical establishments are held to be democratic. I mean, for example, no supervision of slaves (which may really be advantageous to a democracy up to a certain point), or of women or children, and allowing everyone to live as he wishes; for numerous people will support a constitution of this sort; for it is more pleasant for ordinary people to live in a disorderly fashion than in a temperate one.

6.5
Preserving Democracies

For a legislator, however, or for those seeking to set up a constitution of this sort, setting it up is not the most important work nor indeed the only one, but rather its being preserved; for it is not difficult for those who govern themselves in any way whatever to continue for a day or even for two or three days. That is why one should take the things we got a theoretical grasp on previously[257] about the sorts of preservation and destruction characteristic of constitutions, and from these try to establish stability, carefully avoiding the causes of destruction, while setting up the sort of laws, both written and unwritten, that best encompass the features that preserve constitutions. And one should consider a measure to be democratic or oligarchic not if it will make the city as democratically governed or as oligarchically governed as possible, but if it will make it so for the longest time.

Popular leaders nowadays, however, in their efforts to gratify the people, confiscate many properties through the courts. That is why those who care about the constitution should counteract this by passing a law that nothing that belonged to a condemned person should be confiscated and absorbed into communal property, but rather into sacred property; for those doing injustice will be no less deterred (for they will be fined in the same way as before), while the mob will less frequently condemn defendants (for they will not expect to gain anything). Further, public suits should always be made as few as possible by deterring with large penalties those who bring frivolous ones; for people usually bring them against notables, not men of the people. All citizens should be well-disposed toward the constitution or, failing that, they should at least not regard those in control as their enemies.

256. 1275b34–37.
257. Book 5.

Since ultimate democracies are populous and attending the assembly without wages is difficult, this situation is hostile to the notables in places where there happens to be a dearth of revenues (for the wages have to be obtained from taxes, confiscations of property, and bad courts—things that have already overturned many democracies). Where revenues are lacking, then, few assemblies should be held, and courts with many judges should be in session but for only a few days (for this helps reduce the fears of the rich about expense, provided the rich do not receive pay for jury service but only the poor do, and also greatly improves the quality of judgments in suits; for the rich are unwilling to be away from their private affairs for many days, but are willing to be so for brief periods).

Where there are revenues, however, one should not do what popular leaders do nowadays (for they distribute any surplus [to the poor], who no sooner get it than they need the same again; for helping the poor in this way is like pouring water into the proverbial leaking jug). But the true man of the people should see to it that the multitude are not too poor; this is a cause of the democracy being a bad one. Measures must, therefore, be crafted to ensure long-term prosperity. And, since this is also advantageous to the rich, whatever is left over from the revenues should be collected together and distributed in lump sums to the poor, especially if enough can be accumulated for the acquisition of a plot of land, or, failing that, for a start in trade or farming. And if this cannot be done for all, distribution should instead be by turns in accord with tribe or some other part. In the meantime, the rich should be taxed to provide pay for necessary meetings of the assembly, while being released from pointless public services. **1320**[b]**1**

It is by governing in this sort of way that the Carthaginians[258] have made a friend of the people; for by always sending some of them out to their subject cities, they made them rich. But it is also characteristic of notables who are refined and have understanding to divide the poor amongst themselves and give them a start in turning their hand to doing work. It is well too to imitate the policy of the Tarentines. For by giving communal use of their property to the poor they procure the goodwill of the multitude. They also divided all their offices into two, some that are elected and some chosen by lot: by lot, so that the people share; elected, so that they are better governed. But this can also be done by dividing the same office between those people chosen by lot and those elected.

How democracies should be established, then, has now been stated.

6.6
Preserving Oligarchies (1)

It is also pretty much evident from these remarks how oligarchies should be established. For each oligarchy should be put together from its contraries, by analogy with the contrary democracy, as in the case of the most well mixed and first of the

258. 2.11.

oligarchies, which is the one that is very close to so-called polity. Here the property assessments should be divided in two, some being made smaller and some larger, the smaller ones as the threshold for people being eligible for the necessary offices, the larger ones, for the offices with more control. Anyone who acquires a qualifying property should be allowed to share in the constitution, and the assessment should be used to admit a sufficiently large number of the people that those who share in the constitution will be stronger than those who do not share in it, and those who do share should always be drawn from the better part of the people.

The next oligarchy should be established in a similar way, with a slight tightening [of the qualifications for citizenship].

As for the oligarchy that is contrary to the ultimate democracy, which is the most dynastic and tyrannical sort of oligarchy, the worse it is, the more guarding it requires. For just as bodies that are in good health and ships that are in good condition for a voyage, and as regards their sailors, can admit of more errors without being destroyed thereby, while diseased bodies and ships with loose timbers that happen to have bad sailors cannot survive even a small number of errors, so too the worst constitutions need the most guarding.

1321a1 Democracies are generally preserved by populousness (for this is opposed to justice in accord with worth). But it is clear that an oligarchy must, on the contrary, attain its preservation by good order.

6.7
Preserving Oligarchies (2)

Since there are four principal parts of the multitude (farmer, unrefined, tradesman, and hired laborer) and four that are useful in war (cavalry, hoplite, light infantry, and naval), where the territory happens to be fit for cavalry, there conditions are naturally well suited for establishing a strong oligarchy (for the security of the inhabitants is attained because of a force of this sort, and horse-breeding is in the hands of those who own large estates). Where the territory is fit for hoplites, on the other hand, conditions favor the next sort of oligarchy (for hoplites are more often rich than poor).

A force of light infantry and a naval force, however, are altogether democratic. Therefore, as things stand, wherever there are large numbers of these, and there is factional conflict, the oligarchs often get the worst of the contest. As a cure for this, one should adopt the practice of military commanders who couple a fitting contingent of light infantry to their forces of cavalry and hoplites. This is the way the people prevail over the rich during factional conflicts; for light infantry can easily take on cavalry and hoplites. Oligarchs who put in place such a force drawn from these, then, are putting in place a force against themselves. But since there is a difference of age, and some are older and others younger, they should have their own sons taught lightly armed and unarmed combat while they are young, so that when the latter

have been taken out of the ranks of the boys they will themselves be trained doers of these works.

The multitude should be given a share in the governing body, either in the way stated previously, to those who own an assessed amount of property, or, as in Thebes,[259] to those who have kept out of unrefined works for a given period of time, or, as in Massilia,[260] to those who are judged to be worthy of it, whether they come from inside or outside the governing body.

Further, the offices with the most control, which those in the constitution should hold, should also have public services attached to them, in order that the people will voluntarily not share in them, and will sympathize with rulers on the grounds that they pay a heavy price for office. It is also fitting that, on entering office, they should offer magnificent sacrifices and establish something for the community, in order that the people, through sharing in the festivities, and seeing the city adorned here with votive statues and there with buildings, will be glad to see the constitution endure, and as a result the notables too will have memorials of their expenditure. As things stand, however, those connected with oligarchies do not do these things but the contrary ones, because they seek profit no less than honor. That is why it is well to say that they are miniature democracies.

Let how democracies and oligarchies should be put in place, then, be determined this way. **1321**[b]**1**

6.8
Sorts of Office

Following what has been said there is the matter, as was said previously,[261] of correctly dividing what pertains to the offices, how many they are, what they are, and concerned with what. For without the necessary offices a city cannot exist, and without those related to good order and arrangement it cannot be well managed.

Further, in small cities the offices are necessarily fewer, while in larger ones they are more numerous, as was also said previously.[262] The question of which offices it is fitting to combine, then, and which to keep separate should not be overlooked.

The first of the necessary supervisions, then, is the one concerned with the market, over which there should be some office to supervise contracts and good order; for in pretty much all cities it is necessary that people buy and sell with a view to supplying each other's necessary needs. This is also the readiest way to achieve self-sufficiency, which is believed to be what leads people to join together in one constitution.

259. 1278[a]25–26.
260. 1305[b]1–12.
261. 1298[a]1–3, 1300[b]7–12, 1316[b]39–1317[a]10.
262. 1299[a]31–[b]30.

Another sort of supervision, connected to this one and close to it, is the supervision of public and private property within the city proper, so that it may be kept in good order; also, the preservation and rectification of decaying buildings and roads, the supervision of property boundaries, so that disputes do not arise over them, and all other sorts of supervision similar to these. Most people call this sort of office "city management,"[263] though its parts are more than one in number. More populous cities assign different officials to these parts, for example, wall repairers, well supervisors, and harbor guards.

Another office is also necessary and much the same as this one; for it is concerned with the same areas, though it concerns the countryside and matters outside the city proper. In some places its holders are called "country managers," in others "foresters." These, then, are three sorts of supervision of these things. But another is the office by which public revenues are received, guarded, and distributed to each branch of the administration. Its holders are called "receivers" or "treasurers."

Another is the office by which both private contracts and judgments from the courts must be recorded. Judicial indictments and presentations of judicial proceedings[264] must be recorded by these same officials. In some places this office too is divided into several ones; in others a single office has control of all these matters. The officials are called "sacred recorders,"[265] "supervisors," "recorders," and other names close to these.

The next after this, and pretty much the most necessary and the most difficult of the offices, is the one concerned with actions against those who have been convicted in court, and those whose names are posted as public debtors, and with the guarding of their bodies. It is a difficult office because it provokes a lot of hatred. So where it is not possible to make large profits from it, people are either unwilling to hold it, or those who do hold it are unwilling to act in accord with the laws. It is a necessary office, however, because there is no benefit in having judicial proceedings about matters of justice, if they do not achieve their end. So if, when the former do not occur, people cannot live in a community with each other, they cannot do so either when no actions are taken. That is why it is better for this not to be one office but to consist of several people drawn from different courts, and why one should try to divide up the offices connected with posting the list of debtors in a similar way.

Further, it is also better to have [other] officials take some of the actions; in particular, incoming officials should take those imposed by outgoing ones, and, in the case of sitting officials, one should pass sentence and another take the action. For example, the city managers should take the action imposed by the marketplace managers, while other officials take those imposed by the city managers; for the less hatred there is toward those who take the action, the more the actions will achieve their end. To have the same people pass sentence and act on it doubles the hatred, and to have the same people do so in all cases makes them an enemy to everyone.

263. *Ath*. 50.2.
264. *Ath*. 52.2–3.
265. *Ath*. 30.2.

In many places the office that keeps prisoners in custody is different from the one that carries out the sentence, as, for example, in the case of the office of the so-called Eleven in Athens. That is why it is also better to split it up, and to use the same subtle device in its case too. For though it is no less necessary than the previous one, decent people avoid this office most of all, but giving control of it to depraved ones is not safe; for they themselves are more in need of guarding than capable of guarding others. That is why there should not be a single office assigned to guard prisoners, nor the same office continuously. Instead, prisoners should be supervised by different people in turn, chosen from among the young men, in places where there is a regiment of ephebes[266] or guards, or from the other officials.

These offices are to be counted as first, then, as the most necessary. After these there are others that are no less necessary, but ranked more highly; for they require much experience and trustworthiness.

The offices concerned with the defense of the city are of this sort, and any that are ordered to meet its military needs. In both peacetime and wartime alike there should be supervisors to supervise the defense of the gates and walls, and likewise the inspection and marshaling of the citizen troops. In some places there are more offices assigned to all these areas; in others there are fewer (in small cities, for example, a single office is concerned with all of them). Such people are called "generals" or "war-officers." Further, if there are also cavalry, light infantry, archers, or a navy, **1322^{b}1** an office is sometimes put in place for each of them. These are called the office of "admirals," of "cavalry commanders," and of "regimental commanders," while those in charge of the units under these are called the office of "warship commanders," of "company commanders," and of "tribal leaders," and so on for their sub-units. But all of these together are included in a single form: supervision of military matters. This, then, is the way things stand with regard to this office.

But since some if not all of the offices handle large quantities of public property, there must be a different office to receive and examine their accounts, which does not itself handle any other matters. Some call these "inspectors," "accountants," "auditors," or "advocates."

Besides all these offices, there is the one that has most control of everything; for the same office often has control over the implementing as well as the introduction of a measure, or else[267] presides over the multitude where the people have control; for there must be some body to convene the controlling element in the constitution. In some places, these are called "preliminary councilors" (*probouloi*), because they make preliminary deliberations (*probouleuein*) [for the assembly].[268] But where the multitude are in control they are called a "council" instead.

The offices that are political, then, are pretty much this many.

266. *Ath*. 42.3.
267. Reading ἢ.
268. *Ath*. 45.4.

Another form of supervision, however, is that concerned with the gods—for example, priests, supervisors of matters relating to the temples (such as the preservation of existing buildings, the restoration of decaying ones), and all other things that that are ordered in relation to the gods. In some places it happens that a single office supervises all of this—for example, in small cities. But in other places there are many officials who are separate from the priesthood—for example, supervisors of sacrifices, temple guardians, and treasurers of sacred funds. Next after this is the office set aside for all the public sacrifices that the law does not assign to the priests, but which have the honor [of being celebrated] from the communal hearth. These officials are called "archons" by some, "kings" or "presidents" by others.

The necessary sorts of supervision, then, to speak in summary form, are concerned with the following: daimonic affairs, military affairs, revenues and expenditures, the market, the city proper, harbors, and the countryside; further, matters relating to the courts, such as registering transactions, [taking legal] actions, keeping prisoners in custody, receiving accounts, and inspecting and examining officials; and, finally, matters relating to the element that deliberates about public affairs.

Special to cities that enjoy greater leisure and prosperity, on the other hand, and that also pay attention to good order are the offices dealing with the supervision of women, the guardianship of the laws, the supervision of children, control of the gymnasia, and, in addition to these, the supervision of athletic and Dionysiac contests, as well as of any other such public spectacles there may happen to be.[269] Some of these are obviously not democratic—for example, the supervision of women and that of children; for the poor have to employ their women and children as servants, because of their lack of slaves.

There are three offices that cities use to supervise the election of the officials who are in control: law guardians, [preliminary] councilors, and council. The law guardians are aristocratic, the preliminary councilors oligarchic, and the council democratic.

As regards offices, then, pretty much all of them have been spoken about in outline.

BOOK 7

7.1
The Most Choiceworthy Life

Anyone who is going to make an inquiry about the best constitution in the appropriate way must first determine what the most choiceworthy life is. For if this remains unclear, what the best constitution is must also remain unclear; for it is appropriate

269. *Ath*. 56.5, 57.1, 60.1, 60.3.

for those people who govern themselves in the best way to do the best that their circumstances allow—provided nothing contrary to reasonable expectation occurs. That is why there should first be agreement about what the most choiceworthy life is for (one might almost say) everyone, and then determine whether it is the same or distinct for all communally as for each separately.

Considering many things said about the best way of living even in the external accounts to be adequate, then, these must be made use of here as well. For, to tell the truth, as regards one way of dividing them at any rate, no one would dispute that, since there are three groups—external goods, goods in the body, and goods in the soul—all of them must belong to those who are blessed. For no one would say that someone is blessed who has no shred of courage, temperance, justice, or practical wisdom, but is afraid of the flies buzzing around him, stops at nothing, no matter how extreme, when he has an appetite to eat or drink, kills his dearest friends for a pittance, and has thoughts as foolish and deluded as a child's or a madman's.

But while these claims are ones that almost everyone would agree with, people disagree about their quantity and their relative superiority. For they consider any quantity of virtue, however small, to be sufficient, while of wealth, property, power, reputation, and the like they seek unlimited excess. We, however, will say to them that it is easy to achieve conviction on these matters even from the facts themselves, since we see that the virtues are not acquired and safeguarded by means of external goods, but rather it is the other way around, and living happily for human beings, whether it consists in enjoyment or virtue or both, is possessed **$1323^{b}1$** by those who have cultivated their characters and minds excessively, but have been moderate in their acquisition of external goods, rather than by those who have acquired more of the latter than they can possibly use, but are deficient in the former.

But to those who investigate the matter in accord with argument, the point is also easily seen. For external goods have a limit, just like any instrument, and everything useful is useful for something, and their excess must either harm or bring no benefit to their possessors. In the case of each of the goods of the soul, by contrast, the more excessive it is, the more useful it is—if one should assign to these goods too not only nobility but also utility.

In general, it is clear too, we will say, that the best condition of each thing relative to others is in accord with the superiority of those things whose conditions we say they are. So, if indeed the soul is more estimable, both unconditionally and to us, than property and the body, its best condition of each one of them must be proportionally better than that of the others. Further, it is for the sake of the soul that these things are naturally choiceworthy and that every practically wise person should choose them for its sake, not the soul for theirs.

Let us take it as agreed among us, then, that to each person falls just as much happiness as he has virtue, practical wisdom, and action done in accord with them.

As evidence of this, we may use the [primary] god,[270] who is happy and blessedly so, not because of any external goods but because of himself and by being in his nature of a certain quality. That is also why good luck and happiness are necessarily different (for chance or luck is the cause of the goods external to the soul, but no one is just or temperate by luck or because of luck).

The next point, and one depending on the same arguments, is that the happy city too is the one that is best and acts nobly. But it is impossible for those who do not do noble things to act nobly, and there is no noble work, either belonging to a man or to a city, that is separate from virtue and practical wisdom. But the courage, justice, practical wisdom, and temperance of a city have the same capacity and shape as those in which each human being who is said to be courageous, just, practically wise, and temperate should share.

But let these remarks, as far as they go, serve as a preface to our account; for not to touch on these issues is impossible, but neither can we go through all the arguments pertaining to them, for that is work for another leisured discussion.[271] But for now, let this much be assumed, that the best life, both for each separately and for cities collectively, is one involving virtue that is sufficiently furnished with the resources needed to participate in actions that are in accord with virtue. With regard to those who dispute this, we must ignore them in our present methodical inquiry, but investigate their objections later, if anyone happens not to be persuaded by what has been said.

7.2
The Political Life and the Philosophical Life (1)

But whether happiness must be said to be the same thing both for each individual human being and for a city or not the same thing remains to be discussed. But here too the answer is evident. For everyone would agree that they are the same. For those who suppose that living well in the case of an individual lies in wealth will also count blessed a whole city if it is rich. And those who have the highest esteem for the tyrannical life would say that the city that rules the greatest number is happiest. And if someone approves of an individual because of his virtue, he will also say that the more excellent city is the one that is happier.

But already there are two questions that need to be investigated. First, which life is more choiceworthy, the one that involves being active in politics with other people and sharing in the city, or rather the life of an alien, detached from the political community? Further, what constitution and what condition of the city is to be counted as best—regardless of whether sharing in a city is choiceworthy for everyone or for most but not for some? Since [to answer] this question, but not the one about what

270. *Met.* 12.7–10.
271. E.g., that in *NE* and *EE*.

is choiceworthy for each, is a work of political thought and theoretical investigation, and this is the sort of investigation we have deliberately chosen to undertake now, the first is a side issue, while the second is a work of our methodical inquiry.

It is evident that the best constitution is necessarily that order in accord with which anyone might be able to do best and live blessedly. But the very people who agree that the most choiceworthy life is the life that involves virtue are the ones who dispute about whether the political and practical life is choiceworthy or rather the one detached from all external concerns—some sort of contemplative life, for example, which some say is the only life for a philosopher. For it is evident that these two lives are pretty much the ones that the human beings most ambitious for virtue deliberately choose, both in earlier times and at present. The two I mean are the political life and the philosophic one. And it makes no small difference on which side the truth lies; for the person, at any rate, who thinks correctly must order his affairs by looking to the better target—and this applies to each human being and to the constitution communally.

Some people think that ruling as a master over one's neighbors involves one of the greatest injustices, and that political rule, while it involves no injustice, does involve an impediment to the ruler's own joy in life. But others hold beliefs that are almost the contrary; for they think that the practical and political life is the only one for a man; for the actions resulting from each virtue are not more open to private individuals than to those who are active in communal affairs and participate in politics. Some, then, give this reply, but others say that the mode of constitution that rules as **1324b1** a master or a tyrant is the only happy one. Among some peoples, indeed, this is the defining mark of the constitution and the laws—to rule as a master over neighbors.

That is why, although most laws have been laid down in most cases (one might almost say) at random, nonetheless if there is some one thing to which the laws do to some extent look, it is the exercise of power that they all aim at. For example, in Sparta and Crete it is pretty much entirely with a view to wars that education and most of the laws are ordered. Further, among all the [barbarian] nations that have the power to get more this power is esteemed—for example, among the Scythians, Persians, Thracians, and Celts. For in some cases they even have laws that spur them on to this sort of virtue. In Carthage, for example, so it is said, they receive armlets as decorations for each campaign in which they serve. There was once a law in Macedonia too that any man who had not killed an enemy must wear as his belt a rope used to tether a horse to a manger. Among the Scythians, anyone who had not killed an enemy was not permitted to drink from a cup passed around at a certain feast. And among the Iberians, a warlike nation, they plant as many small obelisks around a man's tomb as the number of enemies he has killed. And there are many other things of this sort among other peoples, some sanctioned by the laws, others by customs.

And yet it would presumably seem quite absurd to those wishing to investigate the matter, if the work of a politician is to be able to get a theoretical grasp on how to rule or master his neighbors, whether they wish it or do not wish it. For how could

this be up to a politician or a legislator, when it is not even lawful? And it is unlawful to rule not only justly but also unjustly (although it is in fact possible to exercise power unjustly).

Moreover, this is not what we see in the other sciences either; for it is not the doctor's or the ship captain's work to persuade or otherwise use force against his patients (in the one case) or his passengers (in the other). But many seem to think that mastership is politics, and the very same thing they all deny to be either just or advantageous for themselves, they are not ashamed to practice on others; for they seek just rule among themselves, but toward others they care nothing about justice. It is strange, though, unless it is by nature that one thing is suited to be ruled by a master and another not suited to be ruled by a master. So if indeed things are that way, one must not try to rule as a master over everyone, but only over those who are suited to be ruled by a master, just as one must not hunt human beings for a feast or a sacrifice, but rather what is suited to being hunted for this—and any wild beast that is edible is suited to being hunted.

Moreover, it is possible for a single city to be happy even by itself (that is, one that is governed in a good way), if indeed it is possible for a city to be settled somewhere by itself and employ excellent laws, and whose constitution will not be ordered with a view to war or to controlling its enemies; for it is to be assumed that it has none.

It is clear, therefore, that all military pursuits are to be counted as noble, not as being the highest end of all, but rather as being for the sake of that end. And [the work] of an excellent legislator is to see how a city, a race of human beings, or any other community can come to have a share in good living and in the happiness that it is possible for them. There will be differences, indeed, in some of the laws that are prescribed, and it belongs to legislative science to see, if there are neighboring peoples, what sorts of things must be practiced in relation to what sorts of people and how the appropriate ones are to be used in relation to each.

But this issue—what end the best constitution should aim at—will receive an appropriate investigation later on.[272]

7.3
The Political Life and the Philosophical Life (2)

As regards those who agree that a life that involves virtue is most choiceworthy, but disagree about the use of it, we must say to both sides that they are both in part correct in what they say and in part incorrect. For those on one side reject political offices, since they consider that the life of a free person is different from that of a politician and is also the most choiceworthy one of all, while those on the other side

272. 7.13–15.

consider that the political life is best; for it is impossible for someone who does no action to do well, and doing well in action and happiness are the same.

On the one side we have that the life of a free person is better than that of a master. This is indeed true; for there is certainly nothing dignified about using a slave as a slave; for giving orders about necessities has no share in what is noble. But to consider that every rule is rule of a master is surely incorrect; for there is no less a distance between rule over free people and rule over slaves than between being by nature free and being by nature a slave. Enough has been determined about these in our first accounts.[273]

On the other side, to praise inaction more than action is not correct; for happiness is action, and further, the actions of those who are just and temperate achieve an end of many things that are noble.

And yet perhaps someone might take these determinations to imply that control over everyone is best; for in that way one would control the greatest number of the actions that are noblest. And so someone who has the power to rule should not let rule pass to his neighbor, but rather take it away from him. And a father should take no account of his children, or a child of his father, or in general a friend of his friend, or give any thought to them in comparison to this; for what is best is most choiceworthy, and doing well in action is best.

Perhaps what they say is true, if indeed the most choiceworthy thing there is will belong to those who commit robbery and use force. But presumably it cannot **$1325^{b}1$** belong to them, and this assumption is false. For his actions cannot yet be noble if the agent is not as superior [to those he rules] as a man is to a woman, a father to his children, or a master to his slaves. And so the transgressor can do nothing to later correct so great a previous deviation from virtue. For among those who are similar, the noble and the just thing is to take turns [in ruling and being ruled], for this is equal and similar treatment. But unequal shares for equal people or dissimilar ones for similar people is contrary to nature, and nothing contrary to nature is noble. That is why, when someone else is more excellent in virtue and in his practical capacity to do what is best, it is noble to follow him and it is just to obey him. But he must possess not virtue alone, but also the capacity in accord with which he will be a doer of action.

If the things that have been said are correct, and happiness is to counted as doing well in action, the best life, both for the whole city collectively and for each individual, would be a practical life.[274] Yet it is not necessary, as some suppose, for a practical life to be in relation to other people, nor are those thoughts alone practical that arise for the sake of the consequences of doing an action; much more practical are the acts of contemplation and thought that are their own ends and are engaged in for their own sake; for doing well in action is the end, and so action of a sort is the end too.

273. 1.4–7.

274. I.e., one focused on action.

And we say that, strictly speaking, the ones who above all do actions, even external actions, are the architectonic craftsmen who do them by means of their thoughts.

Moreover, it is not necessary for even those cities to be inactive that are situated by themselves and have deliberately chosen to live that way; for actions can take place even among their parts; for the parts of the city have many communal relations with each other. Similarly, this also holds of any individual human being; for otherwise the [primary] god and the entire cosmos could scarcely be in a noble condition, since they have no external actions beyond the [internal] ones that are proper to them.

It is evident, then, that the same life is necessarily best both for each human being and for cities and human beings collectively.

7.4
The Size of the Best City

Since what has just been said about these matters was by way of a preface, and since we got a theoretical grasp on the other constitutions previously, the starting-point for the remainder of our investigation is first to discuss the sorts of hypotheses there should be concerning the city that is going to be set up so as to be in accord with our prayers. For the best constitution cannot come into existence without commensurable resources. That is why many things should be hypothesized in advance, just as when praying, although none of them should be impossible. I mean, for example, the size of the citizenry and of the territory. For just as other craftsmen—for example, a weaver or a shipbuilder—must also be supplied with matter suitable for doing the work, and the better the matter has been prepared, the nobler what results from their craft must be, so too the proper matter that a politician and legislator are supplied with must be in a suitable condition.

First among the resources belonging to politics is a multitude of human beings, how many there should be of them, and of what quality they should be by nature. And likewise for the territory, how large it should be, and of what sort. Most people think that it is appropriate for a happy city to be a great one, but even if what they think is true, they are ignorant of the quality that makes a city great or small. For they judge a city to be great if the number of its inhabitants is large, while they should look not to number but to capacity. For a city too has a certain work, so that the city that is best able to complete it is the one that must be thought greatest. Similarly, one should say that Hippocrates is greater not as a human being but as a doctor than one who exceeds him in physical size.

Yet even if one should judge the greatness of a city by looking to the multitude, this must not be toward any random multitude (for perhaps of necessity there are a large number of slaves, resident aliens, and foreigners present in cities), but rather to those who are part of it—that is, who form the parts proper to a city, those of which it is composed; for possessing a superior number of these is the sign of a great city. A

city that can send a large number of unrefined people out to war, on the other hand, but only a few hoplites, cannot possibly be great; for a great city and a populous one are not the same.

And this too is, at any rate, evident from the facts, that it is difficult, perhaps impossible, for a city that is overly populous to be in good legislative order. Certainly, among those that seem to be governed in a good way, we see none being lax as regards the number. And this is also clear from trustworthy arguments. For law is a sort of order, and so good legislative order must be a [sort of] good order. But an overly large number cannot share in order; for that would be a work of a divine power, the sort that holds the universe together, since the noble, at any rate, is usually found in number and magnitude.[275] That is why that city is most noble where, together with magnitude, the defining mark that has been mentioned is also found.

But of the magnitude of a city there is a certain measure, just as in the case of everything else—animals, plants, and instruments; for in fact when each of them is neither overly small nor too excessively large, it will have its own capacity, but otherwise will either be wholly deprived of its nature or be in bad condition. For example, a ship that is one span long will not be a ship at all, nor will one of two stades, but, as it approaches a certain size, it will sail badly, in the one case because of its smallness, in the other because of its excessive size. **1326**^{b}**1**

Likewise also in the case of a city, one that is composed of too few people is not self-sufficient (while a city is something self-sufficient), but one that is composed of too many, while it is self-sufficient in the necessities, the way a nation is, is still no city; for it is not easy for it to have a constitution; for who will be the general of its excessively large multitude, and who, unless he has the voice of Stentor, will serve as its crier? That is why, while the first city must be the one composed of a multitude of the sort that is the first multitude large enough to be self-sufficient with a view to living well in accord with a political community, it is also possible for a city that exceeds this one in number to be a greater city, but, as we said, this is not possible indefinitely.

What the defining mark of this excess is can easily be seen from the facts; for a city's actions are either those of the rulers or those of the ruled. And a ruler's work is prescription and judgment. But with a view to judgments in suits and with a view to distributing offices in accord with worth, each citizen must know the other citizens, that is, know what sorts of people they are, since where they do not know this, matters regarding the electing of officials and judgments in suits must go badly. For to act in an offhanded way is unjust in both these proceedings. But this is manifestly precisely what occurs in an overly populous city.

Further, it is easy for resident aliens and foreigners to get a share in the constitution; for it is not difficult for them to escape notice because of the excessive size of the population.

275. *Po.* 1450^{b}34–37.

It is clear, therefore, that the best defining mark for a city is this: it is the greatest excess of multitude with a view to self-sufficiency in living that can be easily surveyed as a whole. Let the size of the city, then, be determined in this way.

7.5
Territory

Much the same also holds in the case of the territory. For, as regards the sort of territory, it is clear that everyone would praise the most self-sufficient (and such a territory must be all-producing; for self-sufficiency is having everything and needing nothing). In quantity or extent it should be large enough to enable the inhabitants to live at leisure in a way that is generous and at the same time temperate. But whether this defining mark is correctly or incorrectly stated is something that must be investigated with greater exactness later on,[276] when we come to make mention of possessions in general, what it is to be well-off as regards property, and how and in what way this is related to its use; for there are many disputes about this subject of investigation because of those who draw us toward either of the two extremes of life, the one lot toward tightfistedness, the other toward luxury.

The form of the territory is not difficult to describe (although on some points one should listen to those experienced in generalship): it must be difficult for enemies to invade and easy for the citizens themselves to get out of.[277] Further, just as the multitude of people should, as we said, be easy to survey as a whole, the same also holds of the territory, since for a territory to be easily surveyed as a whole is for it to be easily defended.

As for the position of the city, if it is to be made in accord with our prayers, it is appropriate for it to be well situated in relation both to the sea and to the surrounding territory. One defining mark was mentioned above: defensive troops must have access to all parts of the territory. The remaining defining mark is that the city should allow easy transportation with a view to the conveyance of collected crops, and materials for the wood market besides, and for doing any other work of this sort the territory happens to have.

7.6
Access to the Sea and Naval Power

As regards communication with the sea, there is much dispute about whether it is beneficial or harmful to cities that are in good legislative order; for it is said that entertaining foreigners as guests who have been brought up under different laws

276. Not in the extant *Politics*.
277. Aristotle seems to mean "easy to get out to." See 1327a6–7.

is detrimental to good legislative order, as is populousness, and that, as a result of their use of the sea for importing and exporting, a multitude of traders comes about, and this is contrary to being governed in a good way. But it is quite clear that, if these things do not come about, then it is better both with a view to safety and to ensuring a ready supply of necessities for a city and its territory to have access to the sea. For in fact with a view to withstanding war more easily people should be readily defensible both on land and sea if they are to preserve themselves. And with a view to inflicting harm on their attackers, if they are unable to do so on both, at least they will be in a better position to do so on one or the other, if they have access to both.

It is also necessary for cities both to import the things that are not available at home and to export those of which they have a surplus; for a city should engage in trade for itself, not for others, while those that open their market to everyone do so for the sake of revenue. But a city that must not be involved in this sort of getting more must not have a trade of this sort either.

Since, even as things stand, we see many territories and cities that have ports or harbors naturally well situated in relation to the city, so that they are neither parts of the same city proper nor too far away from it, but are kept under its control by walls and other similar defenses, it is evident that if any good comes from this sort of communication [with a port or harbor], it will be available to the city, while if there is anything harmful, it can be prevented by means of laws that specify or define the sorts of people that should or should not have dealings with each other.

As far as the naval force is concerned, it is quite clear that it is best to have up to a certain size (for a city should also be formidable on sea, exactly as it should be on land, able to aid not only itself but also some of its neighbors). But as regards the **1327b1** number and size of this force, one must look to the life of the city. For if it is going to live a life of leadership and a political life, it must also have a force of this sort that is commensurable with its actions.

It is not necessary for cities to suffer the populousness associated with a seafaring mob; for they should not be part of the city at all. For the force of marines is free and consists of infantry, and it is what has control and commands the ship. And if the city contains a multitude of subject peoples and farmers, there cannot be any shortage of sailors. We see this happening in certain cities even now—for example, in the city of Heraclea; for it can man many triremes, despite being more modest in number [of citizens] than many other cities.

As regards territory, harbors, cities, the sea, and naval force, then, let matters be determined in this way.

7.7
The Influences of Climate

We spoke previously[278] about what the defining mark is to be for the multitude of citizens. Let us now discuss of what sort they should be as regards their nature.

One may, then, pretty much understand what this is by looking at those Greek cities that are well reputed, and at the way the entire inhabited world is divided into nations. For the nations in cold regions, particularly in Europe, are full of spirit but somewhat deficient in thought and craft knowledge, which is why they remain comparatively free, but are without a political constitution and incapable of ruling their neighbors. Those in Asia, on the other hand, have souls endowed with thought and craft knowledge, but they lack spirit. That is why they remain in subjection and slavery.

The Greek race, however, occupies an intermediate position geographically, and likewise shares in both sets of characteristics. For it is both spirited and possessed of thought. That is why it remains free, governs itself in the best way, and is capable of ruling all, should it acquire one constitution. The same difference is also found among the Greek nations in relation to each other; for some have a nature that is one-sided, while in others both these capacities are well blended. It is evident, therefore, that as regards their nature people must be both spirited and possessed of thought, if they are to be easily led to virtue by the legislator.

For some say[279] that guardians should have precisely this quality, friendliness toward those they know and fierceness toward those they do not, and spirit is what produces friendliness; for it is the capacity of the soul that makes us disposed to love. A sign of this is that one's spirit is roused more against associates and friends than against strangers, when one regards oneself as being treated contemptuously. That is why, when Archilochus was complaining about his friends, it was appropriate for him to say to his spirit: "it is you who are choked with rage against your friends."[280] The element of ruling and the element of being free derive from this capacity in all cases; for spirit is both fitted for rule and indomitable. But it is not correct to claim that guardians are to be harsh to those they do not know; for one must not treat anyone in this way. Nor are great-souled people[281] by nature harsh, except to those behaving unjustly. And besides they feel this more toward intimates, precisely as was said previously, if they regard themselves as being treated unjustly. And it is reasonable that this should happen; for they suppose that in addition to being harmed they are deprived of the benefit they consider they are

278. 1326a5–b25.
279. Plato, *Republic* 375b–376c.
280. Fr. 78 Diehl.
281. *NE* 4.3.

owed. Hence the sayings: "Wars among brothers are harsh,"[282] and "Those who have loved excessively will hate excessively too."[283]

As regards the citizens, then, their number and of what sort they should be as regards their nature, and further, about the size and sort of the city's territory, pretty much enough has been determined (for one should not seek the same exactness in accounts as in what comes through perception).

7.8
Necessary Parts of the City

Since, as in the case of the other things that are composed in accord with nature, those things without which the whole cannot exist are not parts of the whole composite, clearly the things that are necessary for the existence of a city must not be counted as parts of it either, and likewise for any other community from which something one in kind is composed (for communities should have some one thing that is common and the same for all the members, whether they share in it equally or unequally)—for example, nourishment, an expanse of territory, or something else of this sort.

But whenever one thing is for the sake of another and the other is that for whose sake it is, they have nothing in common except that one produces and the other gets produced. I mean, for example, the relationship of every instrument and craftsman to the work produced; for there is nothing that is common to the house and the builder, but rather the builder's craft knowledge is for the sake of the house. That is why, though cities need property, property constitutes no part of a city—although among the parts of property are many animate things. But a city is a community of similar people, and exists for the sake of a life that is the best possible.

Since the best thing is happiness, however, and it is some sort of activation or complete use of virtue,[284] and since, as it happens, some people are able to share in happiness, while others are able to do so only to a small degree or not at all, it is clear that this is a cause of there being many forms of city and many different constitutions; for by pursuing this in different ways and by different means each group of people produces different ways of life and different constitutions. **1328b1**

But one must also investigate the question of how many of these things there are that a city cannot exist without; for in fact what we are calling the "parts" of a city would of necessity be included among them. So one must first grasp the number of works there are; for this will make the answer clear. First, there should be a supply of nourishment. Second, crafts (for living needs many instruments). Third, weapons (for the members of the community must also have weapons of their own, both in order to rule, since there are people who disobey, and in order to deal with outsiders

282. Euripides, Fr. 975 Nauck.
283. 854 Fr. 67b Nauck (author unknown).
284. *NE* 1098a15–20.

who attempt to do injustice). Further, a ready supply of wealth, both for their needs among themselves and for military needs. Fifth, but of primary importance, the supervision of religious matters, which is called a "priesthood." Sixth, and most necessary of all, judgment about what is advantageous and just in their relations with each other.

These, then, are the works needed in (one might almost say) every city (for a city is not just any random multitude, but one that is self-sufficient with a view to living, as we say, and if any of these works is lacking, a community cannot be unconditionally self-sufficient). It is necessary, therefore, for a city to be set up in accord with doing these sorts of work. There must, therefore, be a multitude of farmers to provide the nourishment; and craftsmen; and a fighting element; and a rich element; and priests; and judges of what is necessary and advantageous.

7.9
Offices and Who Should Hold Them

Having determined these matters, it remains to investigate whether all these works must be shared by all (for it is possible for all the same people to be farmers and craftsmen and deliberators and judges), or whether distinct people must be assigned to each of the works mentioned, or whether, of necessity, some of these are specialized, while others are common. It is not the same in every constitution. For it is possible, as we said,[285] for everyone to share in all, or for not everyone to share in all, but certain people in certain ones. For these things also make constitutions distinct; for in democracies everyone shares in everything, while in oligarchies it is the contrary.

Since we are investigating the best constitution, however, the one in accord with which a city would be most happy, and happiness cannot exist separate from virtue, as was said previously,[286] it manifestly follows that in a city governed in the best way, possessing men who are unconditionally—not relative to a hypothesis—just, the citizens should not live either an unrefined or a trading life (for lives of these sorts are ignoble and entirely contrary to virtue). Nor should those who are going to be
1329a1 citizens be farmers (for leisure is needed both for the development of virtue and for political actions).

But since the best city contains both a military part and one that deliberates about what is advantageous and renders judgment about what is just, and since it is evident that these are most of all parts of the city, must these works also be counted as distinct,[287] or must both be assigned to the same people? [The answer to] this is evident too, because in one way the works must be assigned to the same people and in another way to distinct ones. For insofar as the prime time for each of the two

285. 1328b24–28.
286. 1323b29–36, 1328a37–b2.
287. Rejecting the addition of ἑτέροις.

works is different, in that one requires practical wisdom and the other strength, they must be assigned to different people. On the other hand, insofar as it is impossible for those capable of using and resisting force to tolerate being always ruled, to that extent they must be assigned to the same people. For those who control the weapons also control whether a constitution will endure or not.

The only course remaining, therefore, is for the constitution to assign both works to the same people, but not at the same time. Instead, just as it is natural for strength to be found among younger men and practical wisdom among older ones, so it is advantageous and just to assign the works to each group in this way; for this division is in accord with worth.

Moreover, the property too should be in their hands. For it is necessary for the citizens to be well supplied with resources, and these people are the citizens. For the unrefined element does not share in the city, nor does any other kind that is not a craftsman of virtue. This is clear from our hypothesis; for happiness necessarily involves virtue, and a city must not be called "happy" by looking at just a part of it, but by looking at all the citizens. It is also evident that the property should be theirs, if indeed the farmers must be slaves, either barbarians or[288] subject peoples.

Among the things enumerated previously,[289] then, only the kind consisting of the priests remains. The order of these is also evident. For no farmer or unrefined person must be appointed as a priest (for it is appropriate for the gods to be honored by citizens). But because the political element is divided into two parts, the military and the deliberative, and because it is appropriate for those who are worn out with age to render service to the gods and find rest, it is to these that priesthoods must be assigned.

The things without which a city cannot be composed, and how many parts of a city there are, have now been stated. For while the farmers, the craftsmen, and the laboring element generally are necessary for the existence of cities, the parts of a city are the military part and the deliberative part. And each of these is separate from the others, some permanently, others by turns.

7.10
The Division of the Territory

It seems to be recognized among those who philosophize about constitutions—and not just nowadays or in recent times—that a city should be divided into separate kinds, and that the military element should be distinct from the farming element. For **1329**[b]**1** it is still this way even now in Egypt, and also in Crete—Sesostris having made such a law for Egypt, so it is said, and Minos for Crete.

288. Rejecting the seclusion of ἢ.
289. 1328[b]2–23.

Communal messes also seem to be an ancient order, having arisen in Crete during the reign of Minos, but those in Italy are much older. For the chroniclers say that one of those who settled there, a certain Italus, became king Oenotria, and that on account of him they changed their name and were called "Italians" instead of "Oenotrians," and the promontory of Europe that lies between the Gulfs of Scylletium and Lametius (which are a half-day's journey apart) was given the name of "Italy." It was Italus, they say, who made the nomadic Oenotrians into farmers, and along with enacting other laws for them, first introduced communal messes. That is why some of those descended from him still make use of communal messes even today, as well as of some of his laws. The ones who lived near Tyrrhenia were the Opicians, who were then (as now) called "Ausonians." The ones living near Iapygia and the Ionian Gulf, in a region called "Siritis," were the Chonians, who were related to the Oenotrians by race. So it was in this region that communal messes were first organized.

The separation of the multitude of citizens according to kind, on the other hand, originated in Egypt; for the kingship of Sesostris extends much further back in time than that of Minos. One should consider, indeed, that pretty much everything else too has been discovered many times—or, rather, an unlimited number of times—in the long course of history.[290] For our needs themselves are likely to teach the necessities, and once they are present, the things that contribute to refinement and abundance reasonably develop. So as regards what pertains to constitutions too, one should think that things hold in the same way.

That all such matters are ancient the facts about Egypt are a sign; for the Egyptians seem to be the most ancient of peoples, yet they[291] possessed laws and political order. That is why one should make adequate use of what has been discovered, but also try to inquire about whatever has been overlooked.

That the territory should belong to those who possess weapons and share in the constitution was stated previously,[292] and why those doing the farming should be distinct from these, and how much territory there must be and of what sort. But the distribution of land, who the farmers should be, and what sort of people they must be, must be spoken about first, since we say[293] that property should neither be held communally, as some have claimed[294]—but it should be communal in its use, as it is among friends—nor yet should any citizen be without nourishment.

As for communal messes, everyone agrees that it is useful for well-established cities to have them (what the cause is of our agreeing with this will be stated later on[295]). All the citizens should share in these, even though it is not easy for the poor to contribute the required amount from their private resources and manage the rest

290. *Met.* 1074b11–12.
291. Rejecting the addition of ἀεὶ ("always").

293. 2.5.
294. 1261a4–8.
295. Not in the extant *Politics*.

of their household as well. Further, expenses relating to the gods should be shared communally by the entire city.

It is necessary, therefore, for the territory to be divided into two parts, one communal and the other belonging to private individuals. And each of these must again be divided in two. One part of the communal land should be used to support public services to the gods, the other for expenditure on the communal messes, while one part of the private land should be located near the frontiers, the other near the city, so that, with two allotments assigned to each citizen, all of them may share in both locations. For this is in accord with justice and equality and also ensures greater concord in the face of wars with neighbors. For wherever things are not this way, some citizens neglect feuds with bordering cities, while others, contrary to what is noble, give too much thought to them. That is why some cities have a law that prohibits those who dwell close to the border from sharing in deliberations about whether to go to war with neighboring peoples, on the supposition that because of their private interest they are incapable of deliberating in a noble way. It is necessary, then, for the land to be divided in this way, due to the causes mentioned.

As for those who do the farming, it is above all necessary—if the matter is to be in accord with our prayers—that they be slaves, who neither belong to the same race nor to spirited ones (for that way they will be useful as regards doing work, and safe as regards not stirring up change). As a second best, they should be barbarian subject peoples, much the same in nature to those just mentioned. Among these, the ones who work on private land should be private to those who possess property, while those who work on the communal land should be communal. The way slaves should be treated, and why it is better to hold out freedom as a reward to all slaves, we will speak about later on.[296]

7.11
Location and Fortifications

That a city should have as much access to the land and to the sea, and likewise to its entire territory, as is possible was stated previously.[297] As regards its own situation, one should pray to be successful in getting a site for it,[298] looking to four things. The first is health, because it is a necessity (for cities that slope toward the east, that is, toward the winds that blow from the direction of the rising sun, are healthier). Second healthiest are those that slope away from the north wind; for they have milder winters.

One of the remaining things to keep in view is that the city should be well situated for political and military actions. With a view to military ones, the city must be easy **$1330^{b}1$**

296. Not in the extant *Politics*.
297. $1327^{a}3–10$, $1327^{a}11–40$.
298. Reading πρὸς αὐτὴν τὴν θέσιν εὔχεσθαι δεῖ κατατυγχάνειν.

for the citizens themselves to get out of but difficult for their enemies to approach and blockade. It must also possess a plentiful water supply of its own, especially springs. But if it does not, a way has been discovered to construct bounteous large receptacles for rainwater to prevent the supply from running short when the citizens are kept away from the countryside by war.

One must give thought to the health of the inhabitants, and this depends on the location being well situated in territory of this sort and facing in this direction, and second, on using healthy water, and making this concern more than a side issue. For the things we use in the greatest quantity and most frequently for our bodies contribute most to health. And the capacity of water and air has a nature of this sort. That is why in all well-thought-out cities, if it happens that all the springs are not equally healthy or if the healthy ones are not abundant, one should distinguish and keep separate those for nourishment and those for other uses.

As regards fortified places, what is advantageous is not the same for all constitutions. For example, an acropolis is oligarchic or monarchical, a level-ground fortification is democratic, and neither of these, but rather a number of strongholds, is aristocratic.

As regards the disposition of private dwellings, the new Hippodamean way[299] of laying them out in straight rows is considered pleasanter and more useful for other actions, but for safety in war the contrary one, which prevailed in ancient times, is more useful; for it makes it difficult for foreign troops to enter and for attackers to find their way around. That is why the best city should share in both of these. This is possible in fact if one establishes it in the way that farmers make "vine clumps"[300] (as some farmers call them), that is, if the city as a whole is not made in straight rows, but only parts and places; for in this way things will be well done regarding both safety and beauty.

As for walls, those people[301] who say that cities that lay claim to virtue should not have them are too archaic in their suppositions about things—and this though they see cities that prided themselves in this way refuted by the facts. It is true that against those who are similar to ourselves and not very superior in numbers it is not noble to seek preservation through fortifying walls. But it can and does happen that the superiority of the attackers is too much for human virtue or for the virtue of a small number of people. So, if one is to preserve oneself and not suffer ill-treatment or wanton aggression, one must think that the safest fortification provided by walls is
1331a1 most appropriate for war—particularly in light of recent discoveries about projectiles and engines for improved precision in sieges. For to think it is required for cities not to build surrounding walls is like seeking to make the territory easy to invade and

299. That designed by Hippodamus of Miletus (2.8).
300. Laid out like the five spots on a die.
301. Plato, *Laws* 778d–779b.

mountainous places removed, and like not building walls around private houses on the grounds that they will make the inhabitants cowardly.

Further, one should not overlook either the fact that it is open to the inhabitants of cities with surrounding walls to treat them in both ways, as having walls or as not having them, while this is not open to the inhabitants of a city without walls. If, then, this is the way things stand, a city must not only have surrounding walls, but must also take care to ensure that they are properly constructed in regard to both the beauty of the city and military needs, as well as others, and, in particular, those brought to light by recent discoveries. For just as attackers are always busily concerned with new ways to get more [of the upper hand], so too, while defenders have already discovered some things, they should seek and devise others; for no one even attempts to attack those who are well prepared from the start.

7.12
Markets, Temples, and Communal Messes

Since the multitude of citizens should be divided in groups for communal messes, and the walls should have guardhouses at intervals, and towers in suitable places, these things clearly suggest that some communal messes should be provided in these guardhouses. That, then, is the way one might arrange these.

As for the buildings assigned to the gods, and the communal messes for officials with the most control, it is appropriate for them to be located both in a fitting place and in the same one—except in the case of temples assigned a separate location by the law or some other prophecy delivered by the Pythian god.[302] And a place like this would be one that is such as to be a conspicuous enough setting for virtue[303] and also better fortified than the neighboring parts of the city.

Below this site, it is fitting to set up a marketplace of the sort they call by that name[304] in Thessaly—the one they call "free." This is one that should be kept clear of all merchandise, and that no unrefined person, farmer, or anyone of that sort may come near unless summoned by the officials. The place would have added appeal if there was also an order of the gymnasia for the older men there; for it is appropriate for this order to be divided into age groups, and to have some of the officials spend their time with the younger men, and have the older men spend time with the officials; for being present in the eyes of the officials is what most engenders true shame, and the sort of fear characteristic of free people.

The marketplace for merchandise, by contrast, should be distinct from this free one, and should have a separate site, conveniently located for collecting together all the things sent in from both land and sea. **1331b1**

302. Apollo.
303. Reading τὴν ἀρετῆς θέσιν.
304. Reading ὀνομάζουσιν.

Since the city's pre-eminent element is divided into priests and officials, it is appropriate too for the order of the communal messes of the priests to be located in the vicinity of the sacred buildings.

As for the boards of officials that are made to supervise contracts, legal accusations, summonses, and other administrative matters of that sort, as well as those that deal with marketplace management and so-called city management, one should establish their seat near the marketplace and in some public meeting place, and the area around the necessary marketplace is of this sort; for the upper marketplace is intended for being at leisure, the lower, for necessary actions.

The order that has just been mentioned must also be imitated[305] in matters pertaining to the countryside; for there too the officials that some call "foresters" and others "country managers" must have messes and guardhouses for the purposes of keeping guard on things. Further, temples must be distributed throughout the territory, some dedicated to gods and others to heroes.

It would be pointless, however, to spend time now in giving an exact account and speaking about things of this sort; for they are not difficult to understand, but difficult to do; for speaking about them is a work of prayer, while having them come about is a work of luck. That is why anything further concerning such matters must now be left aside.

7.13
Happiness and Virtue

The constitution itself, and of which and of what sorts of people the city that is going to be blessedly happy and govern itself in a good way should be composed, must now be spoke about.

There are two things in which well-being consists in all cases: one of these is setting up the target and end of action correctly, the other is discovering the actions that carry us toward it (for it is possible for these either to clash with each other or to be in harmony; for sometimes the target is well set up, but people make an error in what they do to hit it, sometimes they achieve everything that furthers the end, but the end they set up is a base one, and sometimes they make both errors, as in connection with medicine, for example; for sometimes they neither make a correct judgment about what sort of condition a healthy body should be in nor hit upon the things that are productive in furthering the defining mark they set before themselves). But in the crafts and sciences both of these must be mastered, the end and the actions that are toward the end.

It is evident that everyone aims at living well and at happiness. But while it is possible for some to achieve these ends, it is not open to others, either because of

305. Reading μεμιμῆσθαι.

some stroke of luck or because of nature (for living in a noble way also needs certain supplies, although fewer are needed by those in a better condition, more by those in **1332ᵃ1**
a worse one). But others straightaway seek happiness in an incorrect way, although it is possible for them to achieve it.

Since what we are proposing to do is to look at the best constitution, however, and it is the one in accord with which a city will be governed in the best way, and it would be best governed in accord with a constitution that would make it most possible for 5
the city to be happy, it is clear that one should not overlook what happiness is. And we say—and have given this definition in our ethical studies[306] (if anything in those discussions is of benefit)—that it is a complete activation and use of virtue, and this not on the basis of a hypothesis but unconditionally. By "on the basis of a hypothesis" I mean the necessary ones; by "unconditionally" I mean what is nobly [done]. For 10
in the case of just actions, for example, just revenge and punishments spring from virtue, but are necessary, and nobly [done] has [the quality of] necessarily done (for it is a more choiceworthy situation if no man or city needs any such things). By contrast, just actions that aim at honors and prosperity are unconditionally noblest. 15
For the former involve choosing[307] something bad, while the latter are the contrary; for they establish and generate good things.

An excellent man would use poverty, disease, and other sorts of bad luck in a noble way, but blessedness lies in their contraries (for in accord with the definition in our 20
ethical accounts in fact, an excellent man is the sort for whom, because of his virtue, the good things are the unconditionally good ones, so it is clear that his use of them must also be unconditionally excellent and noble). That is why people consider the 25
causes of happiness to be external goods—as if a lyre rather than craft knowledge were taken to be the cause of brilliant and noble lyre playing.

It follows, therefore, from what has been said, that some things must be there to start with, while others must be established by the legislator. That is why we pray for the composition of the city to be successful[308] concerning the things that luck controls (for we take it that luck does control them). 30

The city's being excellent, however, is no longer a work of luck but of scientific knowledge and deliberate choice. But surely a city, at any rate, is excellent by its citizens—those who share in the constitution—being excellent. And in our city all the citizens share in the constitution. This, therefore, must be investigated, how a man becomes excellent. For even if it is possible for all to be excellent [collectively] 35
without each citizen being so individually, the latter is still more choiceworthy; for if each individually is excellent, it follows that all are.

But surely people become good or excellent because of three things. These three are nature, habit, and reason. For in fact one must be born, first of all, a human being, 40

306. Not in the extant ones.
307. Reading αἵρεσίς.
308. Reading διὸ κατατυχεῖν εὐχόμεθα τὴν τῆς πόλεως σύστασιν.

and not one of the other animals. Similarly, one's body and soul must be of a certain quality. But in the case of some qualities, being born with them is of no benefit,
1332b1 because habits make them change; for some qualities, because of their nature, play a double game, going toward the worse or toward the better because of one's habits. But, while the other animals mostly live by nature alone, while to a small extent some also do so by habit, the human being lives by reason as well; for he alone has
5 reason. So these [three] must harmonize with each other. For people do many actions contrary to their habits and their nature because of reason, if they are persuaded that some other way is better.

We determined previously[309] what sort of nature people should have if they are going to be easily handled by the legislator. What is left at this point is a work of
10 education. For some things are learned by habituation and others by listening.

7.14
Rulers and Ruled: Their Education

Since every political community is composed of rulers and ruled, this issue must be investigated, whether distinct people should be rulers and ruled or whether the same
15 ones should be both throughout life; for clearly their education must follow along with these alternatives.

If they differed from each other as much as gods and heroes are believed to differ from human beings—straightaway having a great superiority first in body and then in soul, so that superiority of the rulers in comparison to those ruled was indisputable
20 and evident—it would clearly be altogether better if the same people always ruled and the others were always ruled. But since this is not easy to achieve, and since there are not, as Scylax says there are in India, kings who are so greatly superior to the
25 ruled, it is evident, due to many different causes, that it is necessary for all to share alike in ruling and being ruled in turn. For, in the case of those who are alike, equal is what is the same, and it is difficult for a constitution to endure if it is set up contrary to justice. For along with the ruled there are all those in the surrounding territory
30 who wish to stir up change, and one of the impossible things is that those in the governing body be numerous enough to be stronger than all these.

On the other hand, that the rulers, at any rate, should be different from the ruled is indisputable. Hence the legislator should investigate the question of how this is to be achieved, and how they should share with each other. This was spoken about
35 previously.[310] For nature has provided the distinction[311] by itself making part of the same kind younger and part older, the former fitted to be ruled and the latter to rule; and no one resents being ruled in accord with his age, or considers himself superior,

309. 1327b18–38.
310. 1329a2–17.
311. Reading διαίρεσιν.

especially when he is going to be compensated for his contribution when he reaches the proper age.

It must be affirmed, therefore, that rulers and ruled are in one way the same, in another way distinct. So their education too must be in one way the same, in another way distinct. For if someone is going to rule well, they say, he must first **1333ᵃ1** have been ruled.

But rule, as was said in our first accounts,[312] is either for the sake of the ruler or for the sake of the ruled. Among these, we say that the former is the rule of a master, the latter rule over free people. In some cases the things prescribed differ not with respect to the works they prescribe but with respect to that for the sake of which they are to be done. That is why it is noble even for free young men to perform many of the works that are believed to be appropriate for slaves. For, as regards the noble and the not noble, the difference does not lie so much in the actions themselves as in their ends and what they are for the sake of. Since we say that the virtue of a citizen and a ruler is the same as that of the best man, and that the same man should be ruled first and rule later, the legislator would have to make it his business to determine how and through what practices men become good, and what the end of the best way of living is.

The soul is divided into two parts, one of which has reason intrinsically, while the other does not have it intrinsically, but is capable of listening to it. It is in accord with the virtues of these, we say, that a man is said in a way to be good. As to whether the end lies in one of these more than the other, to those who make the same distinction as the one we mentioned it is not unclear what must be said. For the worse part is always for the sake of the better, and this is as evident in the products of the crafts as it is in those of nature. But the part that has reason is better. And it, in the way that we are accustomed to divide it,[313] is divided into two; for, on the one hand, there is practical reason, and, on the other, theoretical reason. So it is clear that the rational part of the soul must also be divided in the same way. Actions too, we will say, are divided proportionally, and those that belong to the part that is by nature better must be more choiceworthy to anyone who can succeed in doing all [three] or only two of them; for this is always what is most choiceworthy for each individual, the topmost [good] it can attain.

The whole of life too, however, is divided into unleisure and leisure, war and peace, and of things doable in action some are necessary or useful, others noble. And as regards these things, it is necessary to make the same choice as in the case of the parts of the soul and their actions. War must be for the sake of peace, unleisure for the sake of leisure, necessary and useful things for the sake of noble ones.

The politician must legislate, therefore, looking to all these things in a way that is in accord with the parts of the soul and their actions, but more to those that are

312. 1277ᵃ33–ᵇ16, 1278ᵇ30–1279ᵃ21.
313. *NE* 1139ᵃ3–15.

better and those that are ends. And he should legislate in the same way as regards lives and as regards the divisions[314] of actions. For one should be able to be unleisured or to go to war, but more able to sustain peace and leisure, and one should be able to do necessary and useful actions, but noble ones more so. So these are the targets that should be kept in view when educating citizens, both when they are still children and at any other age they need education.

It is evident, however, that those Greeks who are now believed to be governed in the best way, and those legislators who set up their constitutions, neither ordered the various aspects of their constitutions with a view to the best end nor their laws and education with a view to all the virtues, but instead were unrefinedly inclined toward the ones believed to be useful and more conducive to getting more.

Some later writers have expressed the same belief in much the same way as this; for they praise the Spartan constitution and admire the target of its legislator, because he legislated on all matters with a view to conquest and with a view to war. And what they say is easy to refute by argument, and has now been refuted by the facts too. For just as most human beings are eager to rule as masters over many, because this provides them with a ready supply of the goods of luck, so too Thibron manifestly admires the Spartan legislator, as do each of the others who have written about their constitution, because by being trained to dangers, they ruled over many. And yet it is clear—now, at any rate, that their empire is no longer in their hands—that the Spartans are not happy, and that their legislator is not a good one.

Further, this is ridiculous: while keeping to his laws, and there being no impediment to making use of them, they lost their noble way of living. Neither are they correct in their supposition about the sort of rule a legislator should be seen to honor; for rule over free people is nobler and more involves virtue than rule of a master. Further, one should not consider a city happy or praise its legislator because he trained it to exercise power for the purposes of ruling its neighbors; for such things involve great harm. For it is clear that [on the same supposition] any individual citizen who is able must attempt to acquire the power to rule his own city. Yet this is precisely what the Spartans accused their king, Pausanias, of doing, even though he held so high an office.

There is, then, nothing properly political in these sorts of arguments and laws, nor anything beneficial or true. For the same things are best both individually and communally, and it is these that a legislator should produce in the souls of human beings. Military training should not be attended to for the sake of reducing those who are not worthy of it to slavery, but rather, first, in order that the trained ones themselves not be enslaved to others, second, to pursue a position of leadership in order to benefit the ruled, not to be masters of all of them, and, third, to be masters of those who are worthy of being slaves.

314. Reading διαιρέσεις.

That the legislator must give more serious attention to how legislation about matter of war and other matters may be ordered for the sake of leisure and peace, the events testify on behalf of the arguments. For most cities of this sort are preserved while they are at war, but are destroyed once they acquire rule. For they lose their edge, just as iron does, when they remain at peace. But the one responsible is the legislator, who did not educate them to be capable of being at leisure.

7.15
Education and Leisure

Since the end is manifestly the same for human beings both communally and individually, and since it is necessary for there to be the same defining mark for the best man and for the best constitution, it is evident that the virtues for leisure must be present; for, as has often been said,[315] the end of war is peace, and that of unleisure is leisure. But the virtues useful with a view to leisure and passing the time include both those whose work lies in leisure and those whose work lies in unleisure. For many necessities must be present in order for being at leisure to be possible. That is why temperance is appropriate for our city as are courage and resilience; for, as the proverb says, there is no leisure for slaves, and those who are incapable of facing danger courageously are the slaves of their attackers.

Courage and resilience are for unleisure, philosophy for leisure, and temperance and justice are useful during both, and particularly when people remain at peace and are at leisure; for war compels people to be just and temperate, but the enjoyment of good luck and the leisure that accompanies peace make them wantonly aggressive instead. Much justice and temperance are needed,[316] therefore, by those who seem to do best and who enjoy all the things regarded as blessings—people like those, if there are any, as the poets say there are, who live in the Isles of the Blessed; for these above all will need philosophy, temperance, and justice, to the extent that they are at leisure amid an abundance of such goods.

It is evident, then, why a city that is going to be happy and excellent should share in these virtues. For it is shameful to be incapable of making use of good things, but it is even more shameful to be incapable of making use of them in leisure—to appear to be good when being unleisured or when at war, but slavish when at peace and leisure. That is why one must not cultivate virtue as the city of the Spartans does. For the Spartans are not different from the others in this way, in not considering the same things as they do to be the greatest goods for them and for the others, but in **1334b1** considering that these are brought about particularly by means of a certain virtue. But since they take these goods and the enjoyment of them to be greater than that of

315. Most recently at 1333a35–36.
316. Rejecting the addition of μετέχειν.

the virtues {. . .}[317] and that [virtue is choiceworthy?] because of itself is evident from these considerations. What must be theoretically grasped, then, is how and through what means this will come about.

We made a distinction previously,[318] then, to the effect that nature, habit, and reason are needed. And of these, what sort the citizens must be as regards their nature was determined previously.[319] It remains to get a theoretical grasp on whether they are to be educated by means of reason first or by means of habits. For these must harmonize with each other, and the harmony must be the best one; for it is possible for reason to be in error about the best hypothesis, and for us to be led in the same direction because of habits.

This, then, is evident, at any rate. First, just as in other cases, coming to be proceeds from a starting-point, and the end that proceeds from a certain starting-point is starting-point for another end. But reason and understanding are our nature's end, and so it is to further these that the coming to be and the training of our habits should be established. Second, just as soul and body are two, so we see that the soul has two parts as well: the non-rational and the one that has reason. And the states of these are also two in number, one of which is desire and the other understanding. And just as the coming to be of the body is prior to that of the soul, so the non-rational part is prior to the rational. This too is evident; for spirit and wish, and appetite besides, are present in children straight from birth, while rational calculation and understanding are made by nature to arise as they grow. That is why supervision of the body must come first, prior to that of the soul, and then supervision of desire, but supervision of desire must be for the sake of the understanding, and that of the body for the sake of the soul.

7.16
Regulation of Marriage and Procreation

If indeed, then, the legislator should see to it from the start that the bodies of children being reared are to develop in the best possible way, he must first supervise the union of the sexes, that is, when, and between what sorts of people, a marital relationship should be brought about. In legislating for this marital community, he should look both to the people involved and to their time of life, so that they will reach the same stage of life at the same time and there be no dissonance between their capacities, the

317. There seem to be lacunae in the mss. What is missing is probably something like this: But since they consider these goods and the enjoyment of them to be greater goods than the enjoyment (or use) of the virtues, they train only in the sort of virtue that is useful in war, while that they should also train in the sort that is useful in peace and that they should do so because of itself is evident from the foregoing considerations.

318. 1332a35–b8.

319. 1327b18–38.

man still being capable of procreating but the woman not, or the woman capable and the man not (for these things produce conflicts and disagreements among them).

Next, he should also look to the succession of children, for children should not be too far removed in age from their fathers (for the gratitude of children is of no use to more elderly fathers, and the help of such fathers is of no use to their children), neither should they be too close in age (for this leads to many annoyances; for there is less respect in cases of this sort, just as among contemporaries, and the closeness in age is liable to cause disputes over the management of the household).

Further, to return to the point with which we started our discussion, the legislator should look to how the bodies of those who are born are to be in congruence with his wish.

Pretty much all these things come about by supervising one thing. For since it has been determined that men's fertility, to speak of the majority of cases, comes to an end at a maximum age of seventy, and women's at fifty, the starting-point of their sexual union in terms of their ages should be such that it reaches its decline at these times.

The coupling of young people, however, is a bad thing with a view to procreation; for in all animals the young are more likely to bear offspring that are incomplete, and they are more likely to give birth to offspring that are female and small in size, so that the same must occur in human beings as well. The following is a proof of this. In all those cities in which the coupling of young men with young women is the custom, people are incomplete and undersized as regards their bodies.

Further, young women have longer labors, and more of them die in childbirth. That is why some people say that this is the cause of the oracle[320] that was given to the Troezenians, that many were dying because of the marrying off of younger women, not anything relating to the harvesting of the crops.

Further, with regard to temperance, it is advantageous for women to be given in marriage when they are older; for women who have had sex when they were young are believed to be more intemperate. Also, the bodies of males seem to be harmed with respect to their growth, if they have intercourse while their body[321] is still growing; for this growth too takes a definite period of time, after which it is no longer extensive.[322] That is why it is fitting for the women to marry when they are around eighteen years of age, the men when they are thirty-seven, or a little before.[323] For at such an age sexual union will occur when their bodies are in their prime, and, with respect to the cessation of their capacity to procreate, they will also decline together at the appointed times. Further, as to the succession of children, it will occur for them when they are starting their prime, if the birth takes place soon after the marriage, as

320. It allegedly said, "Do not plow the young furrow."
321. Reading σώματος.
322. Rejecting the transposition of ἢ μικρόν ("or is small").
323. Reading ἢ μικρόν <πρότερον>.

can reasonably be expected, while for their fathers it will occur when these are already at the age of their decline, toward the seventieth year.

When copulation should occur, then, has been stated. As for the season, however, one should use the time many people use, since they now correctly set aside the winter as the time to begin this sort of living together as husband and wife. In addition, couples should observe for themselves what is said about procreation by doctors and natural scientists; for doctors have adequately discussed the times that are opportune as regards the body, and natural scientists have discussed the winds, favoring northerly winds over southerly ones.[324]

As to what qualities their bodies should have if they are to be most beneficial to the offspring, it must be spoken about at greater length in our discussion of the supervision of children.[325] It is sufficient to speak of it in outline now. For the [physical] state characteristic of athletes is not useful either with a view to the good state of a citizen or with a view to health or procreation, nor is one that is too reliant on medical treatment and poorly suited to physical exertion. But the state that is in a mean between these two is useful for these purposes. One should, then, have a state that is achieved by physical exertion, but not by violent physical exertion, and that furthers not just one thing, as the state characteristic of athletes does, but rather the actions of free people. And these things should be present in men and women alike.

Even pregnant women must take care of their bodies and not idle or adopt a meager diet. The legislator can easily accomplish this by requiring them to take a walk every day in order to worship the gods whose assigned prerogative is to watch over birth.[326] But with regard to their thought, as opposed to their bodies, it is fitting for them to spend their time more idly; for unborn children manifestly draw resources from their mothers, just as plants do from the earth.

As regards the question of whether to expose offspring or rear them, let there be a law that no disabled one is to be reared, but that offspring not be exposed because of the number of children, if[327] the way the customs are ordered prohibits the exposure of offspring once they are born. The quantity of procreation should be defined, and if some children are conceived by some of those who have intercourse contrary to this, an abortion should be induced before the onset of perception and life; for what is pious and what is not will be determined by perception and life.

Since the starting-point of the age at which men and women must start their copulation has been determined, it must also be determined for how long a time it is fitting for them to render public service by procreating. For the offspring of parents who are too old, like those of parents who are too young, are incomplete in both body and in thought, while those of people who have reached old age are weak. That is why [the length of the time in question should be in accord with the time] when thought

324. *GA* 766b34–767a1, Plato, *Laws* 747d–e.
325. Not in the extant *Politics*.
326. E.g., Artemis and Eileithuia.
327. Reading ἐάν.

is in its prime. In most cases, this occurs—as some of the poets who measure age in periods of seven years have said—around the time of the fiftieth year. So when they have exceeded this age by four or five years they should be released from bringing children into the light of day. If they have intercourse after that, it should be evident that it is for the sake of health, or due to some other cause of this sort.

As for intercourse with another man or another woman, let it be unconditionally not noble to appear to be engaging in it in any way with anyone, when one is a husband[328] and referred to as such. If someone is seen doing anything of this sort during his period of procreation, let him be punished with dishonor appropriate to his error. **1336ᵃ1**

7.17
Education of Children

It should be recognized that the sort of nourishment that children are given once they are born makes a great difference to the strength of their bodies. And it is evident to anyone who investigates the other animals or those nations concerned to cultivate a military disposition that the nourishment that is particularly suited to [children's] bodies has a lot of milk in it but very little wine, because of the diseases [it produces]. Further, it is also advantageous for them to make whatever movements are possible at that age. But to prevent curvature of the limbs, due to softness, there are certain mechanical instruments,[329] which some nations employ even today, to make their bodies straight. It is also advantageous to habituate them to the cold right from the time they are small children; for this is very useful both with a view to health and with a view to military actions. That is why many barbarian nations have the custom of submerging newborn children in a cold river, while many others—for example, the Celts—dress them in light clothing. For in all cases in which it is possible to habituate, it is better to habituate right from the start, but to do so gradually. And because their bodily condition is hot, children are naturally well suited to being trained to bear the cold.

In the first stage of life, then, it is advantageous to adopt this sort of supervision as well as any that are much the same as it. During the following stage, which lasts until five years of age, it is not a good idea to have children engage in any sort of learning or any necessary physical exertion, lest it impede their growth. But they should engage in as much movement as will prevent laziness of the body, and this must be provided for them both through various activities and through play. But the games they play should not be either unfree, or exerting, or undisciplined.

As for the sort of stories and fables that children of this age should listen to, let this be the concern of the officials who are called "child supervisors." For all things of this

328. Rejecting the addition of ἀνὴρ.
329. The precise nature of these is unknown.

sort should pave the way for their later pursuits. That is why many of the games they play should imitate the things they will give serious attention to later on.

Those in the *Laws*[330] who prevent children from screaming and crying are wrong to prohibit things of this sort; for they contribute to growth; for they are in a way an exercise for the body; for holding the breath produces strength in those who are exerting themselves, and this is what happens in children when they exert themselves in screaming.

The child supervisors must investigate the way children pass the time, particularly to ensure that they are as little as possible in the company of slaves. For at this age, and until they are seven years old, it is necessary for them to be reared in their households. So it is quite reasonable to expect that they will pick up an element of unfreedom from what they see and hear even at that early age.

The legislator should in general banish shameful language from the city, as he would any other shameful thing (for by speaking lightly of whatever is shameful one comes closer to doing it too). He should above all banish it from among children, so that they neither say nor hear anything of this sort.

If, however, anyone is found saying or doing something forbidden, and is a free man who is not yet old enough to have been given a seat at the communal messes, he should be punished with loss of honors or with blows, while, if he is older than this, he should be punished with those dishonors usually reserved for the unfree, because he has acted in a manner characteristic of slaves.

Since we are banishing speech about anything of this sort, it is evident that we should also banish looking at pictures or stories that are unseemly. The officials must take care, then, that no statue or picture be an imitation of such actions, except in the precincts of certain gods at whose festivals custom permits even licentious raillery to occur.[331]

In addition to these, the law allows those of a suitable age to pay this sort of honor to the gods on behalf of themselves, their children, and their wives. But there must be legislation[332] that younger people not be spectators either of iambus[333] or of comedy until they have reached the age when it is appropriate for them to recline at the communal table and drink wine, at which time their education will make them entirely unaffected by the harm resulting from such things.

330. 791d–792e.

331. Ritualized obscenity and scurrilous mockery played a role in certain religious festivals honoring Dionysus, Demeter, and other gods.

332. Reading θεατὰς νομοθετητέον.

333. A figure named "Iambe" is mentioned in the *Homeric Hymn to Demeter*, who uses language so abusive that the goddess is overcome by laughter and forgets her sorrows. Iambus is associated especially with scurrilous personal humor of the sort exemplified by the work of Archilochus.

To be sure, our present discussion of this issue has been cursory. Later on we must stop and determine it at greater length,[334] first going through the puzzle of whether [prohibiting the attendance of the young at such performances] should be done or not, and if so how it should be done. But the present was the appropriate time, however, to have made mention of it to the extent necessary. For perhaps the remark of Theodorus, the tragic actor, was not a bad one; for he said that he never allowed anyone else, not even an incompetent actor, to enter a scene before him, because audiences become accustomed to the voice they hear first. The same is true of our relationships with people and things: all we encounter first we like better. That is why everything base must be made alien to the young, especially if it involves depravity or ill will.

When the first five years have passed, children should spend the two years till they are seven observing the lessons they themselves will need to learn. There are then two stages in their education that must be distinguished, from seven years to puberty and from puberty to twenty-one years. For those who divide the stages of life into seven-year periods are not for the most part incorrect. And one should follow the natural division; for every craft and every sort of education wishes to fill in what nature leaves out. **1337ª1**

First, then, it must be investigated whether some order must be produced that is concerned with the children; next, whether it is advantageous for the supervision of them to be made a communal matter or done in some private way (as is also the case in most cities now); and third, what sort of supervision it should be.

BOOK 8

8.1
Education Should Be Communal

No one would dispute that the legislator must be especially concerned with the education of the young; for in fact in cities where this does not occur, its absence is harmful to the constitutions; for education should in fact have a view to each particular constitution; for the character that properly belongs to each constitution usually both safeguards it and puts the constitution in place from the start (for example, the democratic character does so for a democracy, and the oligarchic one for an oligarchy), and a better character is a cause of a better constitution in all cases. Further, in the case of every capacity and craft there are things one must have prior education and prior habituation in, with a view to the sorts of work that each must do. So it is clear that this also holds with a view to the actions of virtue.

334. Not in the extant *Politics*.

But since the end for the whole city is a single end, it is evident that education too must be one and the same for all, and that its supervision must be communal, not private as it is at present, where each individual supervises his own children privately, teaching them whatever private instruction he believes [to be best]. But for communal matters, the training too should be communal.

At the same time, one should in no way think that any citizen belongs to himself alone, but that all of them belong to the city, each being a part of the city. And it is natural for the supervision of each part to look to the supervision of the whole. One might praise the Spartans on account of this; for in fact they pay the most serious attention to their children, and do so communally.

8.2
The Aims of Education

It is evident, then, that there must be legislation concerning education, and that this must be made communal. But what the education is to be and how someone must be educated should not be neglected. For as things stand there is dispute about its works. For not everyone supposes that the young should learn the same things, whether with a view to virtue or with a view to the best life, nor is it evident whether it is more appropriate that it be more with a view to thought or with a view to the character of the soul.

Investigation on the basis of current education results in confusion, since it is not at all clear whether people should be trained in what is useful for life, in what conduces to virtue, or in something out of the ordinary (for all these proposals have acquired some advocates). Also, nothing is agreed about what furthers virtue (for in fact people do not all esteem the same virtue to begin with, so that it is reasonable to expect them also to diverge about the training needed for it).

1337b1

That children should be taught those useful things that are necessary, however, is not at all unclear. But it is evident that they should not be taught all of them, there being a difference between the works of the free and those of the unfree, and that they should share only in such things as do not make those who share in them unrefined. (Any work should be considered unrefined, and so too any craft or branch of learning, if it renders the body, the soul, or the thought of free people useless for the uses and actions of virtue. That is why we call "unrefined" both the sorts of crafts that put the body into worse condition and the sorts of work that are done for wages. For they make thought unleisured and low.)

Even in the case of some of the free sciences, while it is not unfree to share in them up to a point, to overly apply oneself to them with a view to exactness is liable to result in the harms just mentioned. But what one does an action for the sake of, or learns for the sake of, also makes a big difference; for what one does for one's own sake, for the sake of friends, or because of virtue is not unfree, but someone who does

the same thing because of others would in many cases seem to be acting like a hired laborer or a slave.

8.3
Education and Leisure; Music (1)

The sorts of learning that are now laid down as a foundation, as was said previously,[335] tend in two directions. And there are pretty much four that are customarily taught: reading and writing, athletics, music, and fourth, in some cases, drawing. Reading and writing, as well as drawing, are taught because they are useful for life and have many uses, while athletics is taught because it contributes to courage. In the case of music there is immediately a puzzle to go through. For nowadays most people share in it for the sake of pleasure. But those who at the start assigned it a place in education, did so, precisely as has often been said,[336] because nature itself seeks not only the correct use of unleisure but also the capacity to be at leisure in a noble way. For this is the one starting-point of everything else, and so we should speak about it again.[337]

If both are needed, but being at leisure is more choiceworthy than unleisure and is its end, one must inquire about what it is people should spend their leisure doing. For surely they should not spend it in amusing themselves; for then it would be necessary for amusement to be the end of life for us. But if that is impossible, and if amusements are more to be used in periods of unleisure (for someone who exerts himself needs relaxation, and amusement is for the sake of relaxation, while unleisure is accompanied by toil and strain), because of this, those introducing amusement should watch for the opportune time to use it, as if dispensing it as a medicine. For this sort of movement of the soul is a loosening and, because of the pleasure it involves, a relaxation.

Being at leisure itself seems to involve pleasure, happiness, and living blessedly. **1338ᵃ1**
This, though, does not belong to those who are unleisured, but only to those who are at leisure; for the person who is being unleisured is being so for the sake of some end, because he does not possess it, while happiness is an end, and everyone thinks that it is accompanied not by pain but by pleasure. This pleasure is not taken to be the same by everyone, however, but each takes it to be what is in accord with himself and his state [of character], and the best person takes it to be the best pleasure, the one that comes from the noblest things. So it is evident both that certain things should be learned and taught with a view to the leisure spent in passing the time, and that these teachings and these sorts of learning are for their own sake, while those that are with a view to unleisure are necessary and for the sake of things other than themselves.

335. 1337ᵃ39–42.
336. 1271ᵃ41–ᵇ10, 1333ᵃ30–ᵇ5, 1334ᵃ2–ᵇ28.
337. A reference back to 7.13–15.

That is why our predecessors assigned music too a place in education, not on the supposition that it is necessary (for it is nothing of the sort); nor on the supposition that, like reading and writing, it is useful for making money, managing a household, acquiring learning, and for many political actions, or, as drawing seems to be, useful for judging the works of craftsmen more correctly; nor, again, on the supposition that, like athletics, it furthers health and vigor (for we see that neither of these results from music). What remains, then, is that music is for passing the time in leisure—which is manifestly precisely why people introduce it. For they assign it a place in what they think to be a pastime characteristic of free people. That is why Homer puts it this way: "Call the bard alone to the rich banquet," and then he goes on to mention certain others "who call the bard," he says, "that he may bring delight to all."[338] Elsewhere, Odysseus says that the best pastime is when men are enjoying good cheer and "the banqueters seated in due order throughout the hall, give ear to the bard."[339]

It is evident, therefore, that there is a certain sort of education that sons must be given not as something useful or necessary but as something noble and free. But as to whether it is of one sort or several, which these are, and how they should be taught—these are things that must be spoken about later on.[340] But as things stand, we have come this far along the route, that from the ancients we have some testimony based on the educational subjects they laid down as a foundation; for music makes this clear.

Further, it is also clear that children should be taught some of the useful things (such as reading and writing) not only because of their usefulness but also because many other sorts of learning become possible through them. Similarly, they should be taught drawing not in order not to make errors in their private purchases and avoid being cheated when buying or selling products, but rather because it makes them good at contemplating the beauty of bodies. To be inquiring everywhere about usefulness is least of all fitting for those who are great-souled and free.[341]

Since it is evident that education by means of habits must come before education by means of reason, and that education of the body must come before education of thought, it is clear from these that children must be given over to athletic training and coaching; for the first of these produces a certain quality in the state of their bodies and the other in its works.

8.4
Athletic Training

Some of the cities that nowadays seem to most supervise children produce in them a state appropriate for an athlete, damaging the form and the growth of their bodies,

338. *Odyssey* 18.382–385. The first line is not in the poem as we have it.
339. *Odyssey* 9.7–8.
340. Not in the extant *Politics*.
341. Reading ἐλευθέροις.

while the Spartans, though they did not make this error, nonetheless make them beast-like by the physical exertions they impose, on the supposition that this is the most advantageous thing with a view to courage. And yet, as has been said many times,[342] the supervision of children must neither look to just one [virtue] nor to this one above all. But even if this were the one, the Spartans have not succeeded in procuring it either. For neither in other animals nor in [barbarian] nations do we see courage following along with the greatest savagery, but with a tamer, lion-like character.[343] Many of these nations easily stomach killing and cannibalizing people—for example, of those that live around the Black Sea,[344] there are the Achaeans and Heniochi, and there are other nations on the mainland, some similar to those, others worse, that are skilled in raiding, but in courage they have no share.

Further, we know that the Spartans themselves, as long as they persisted in their love of physical exertions, were superior to others, while now in both athletic and military contests they are left behind by others; for they were superior to others not because they gave athletic training to their young people in that way, but because they alone were trained people competing against untrained ones.

So what is noble, not what is beast-like, should play the leading role here; for it is not the wolf or any other wild beast that would compete against noble danger, but rather a good man. And those who throw the young too much into these [physical exertions], and leave them without direction in the necessary things, produce people who are, at any rate, in truth unrefined, since they have made them useful for one political work only, and one at which they are worse, as our argument states, than other people. One should judge the Spartans not on the basis of their earlier works, but of their present ones, for now they have people who compete with them in education, while earlier they had not.

It is agreed, then, that one must make use of athletic training, and how one must make use of it. For until they reach puberty lighter athletic exercises should be given, but a strict diet and physical exertions should be forbidden, in order that nothing impede their growth; for it is no small sign that this can have such an effect that in the Olympic Games one can find only two or three cases in which the same people were victorious both as men and boys, because, when the young are trained, the necessary athletic exercises take away their strength, but when they have spent the three years after puberty on the other sorts of learning, it is fitting for the next period of their lives to be preoccupied both with physical exertions and strict dieting; for one should not exert thought and body at the same time, for each of these sorts of exertion naturally produces a contrary effect: exerting the body impedes thought; exerting thought impedes the body.

8.5
Music (2)

As regards music, although we have also gone through some of the puzzles in our previous account, it will be well to take these up again now and develop them, in order to provide a sort of keynote for the arguments one might state in an exposition of the subject. For it is not easy to determine what the capacity of music is, or what one should share in it for the sake of. Is it for the sake of amusement and relaxation, like sleep and drink? (For these are not intrinsically excellent things, but pleasant ones, and, at the same time, they "put an end to care," as Euripides says.[345] That is also why people class music together with these things and make similar use of all of them, sleep, drink, and music—and also include dancing among these.) Or perhaps one must think instead that music contributes something to virtue, on the supposition that, just as athletic training establishes a certain quality in the body, so music has the capacity to produce a character of a certain quality, by habituating us to be capable of enjoying ourselves correctly? Or does music contribute something to passing the time and to practical wisdom? For in fact this is to be counted as third of the things mentioned.[346]

It is not unclear that the young should not be educated for the sake of amusement (for while they are learning they are not amusing themselves; for learning involves pain). But neither is it fitting to give a pastime to children of that age, at any rate (for the end [as something complete] is not appropriate for anyone who is incomplete).

But perhaps it might seem that what is a serious matter for children is for the sake of the amusement they will have when they have become men and complete. If that were so, however, what must they learn music themselves for the sake of? Why should they not, like the kings of the Persians and the Medes, take part in musical learning and its pleasure through [the performances of] other people? For those who have made this very thing their work and craft will necessarily produce something better than those who devote only as much time to it as is needed for learning. On the other hand, if they have to exert themselves in such things, they would also have to prepare themselves for the business of gourmet cooking. But that is absurd.

There is the same puzzle, however, even if music is capable of making people's characters better; for why must they learn it themselves, rather than, when listening **1339b1** to others, enjoy it in the correct way and be able to judge [its qualities], like the Spartans? For they do not learn it themselves, but are still able, so they say, to judge which melodies are good and which not good.

The same argument also applies if music is to be used with a view to well-being and a free passing of the time: why must they learn it themselves rather than have the

345. *Bacchae* 381 (paraphrased).

346. Amusement is mentioned at 1337b36–1338a1; passing the time at 1334a11–b5; practical wisdom, which involves virtue of character (*NE* 1144b30–32), at 1333a16–30, 1337b22–33.

enjoyment of other people's use of it? For one might investigate the supposition we have about the gods; for Zeus himself does not sing or play the lyre to accompany the poets. On the contrary, we even say that people of this sort are unrefined, and that doing the actions is not for a [true] man, unless he is drunk or amusing himself.

But perhaps these matters must be investigated later on.[347] The first inquiry is whether music is not to be counted as included in education or is to be counted, and in which of the three things puzzled about previously its capacity lies, amusement, education, or passing the time. And it seems reasonable to assign it a place—and it appears to have a share—in all of them. For amusement is for the sake of relaxation, and relaxation is necessarily pleasant (for it is a sort of cure for the pain caused by one's exertions).

Also, it is generally agreed that one's pastime should not only involve what is noble but also what is pleasant (for being happy is composed of both of these). And everyone says that music is among the most pleasant things, both when it is unaccompanied and when it involves singing. At any rate, Musaeus says that "singing is the most pleasant thing for mortals." That is why, indeed, it is reasonably included in social gatherings and pastimes, as having the capacity to delight. And so one might suppose from that too that young people should be educated in music. For those pleasures that are harmless are fitting not only with a view to the end, but also with a view to relaxation. But since it rarely happens that human beings attain the end, while they do frequently relax and make use of amusements (not only because relaxation and amusements lead to other things, but also because of pleasure), it would be useful to allow the young to find rest from time to time in the pleasures coming from music.

What has happened, however, is that human beings make amusements their end; for presumably the end involves a certain pleasure too, although not just a random one, and in their search for it they take amusement to be it, because pleasure has a certain similarity to the end of actions. For the end is not choiceworthy for the sake of anything that will be, and these sorts of pleasures are not choiceworthy for what will be, but because of things that have happened—for example, physical exertions and pains. One might reasonably suppose, then, that it is due to this cause that they seek to achieve happiness by means of these pleasures. But as regards their taking part in music, it is not because of this alone, it seems, but also because it is useful with a view to relaxation.

Yet one must surely investigate whether this effect is not coincidental and music's nature more estimable than one that is in accord with the use just mentioned, and **1340ᵃ1** whether one should not merely share in the common pleasure that comes from music, of which everyone has a perception (for music has a natural pleasure, which is why the use of it is agreeable to people of all ages and characters), but see whether it contributes in some way to character and soul. This would be clear, if we come to be of a certain quality in our characters through music. But that we do come to

347. 8.6.

be of a certain quality is surely evident because of many different things, not least, indeed, because of the melodies of Olympus; for it is generally agreed that they make souls become ecstatic, and ecstasy is a feeling connected to the character of the soul. Further, everyone who listens to imitations comes to have the corresponding feelings, even in separation from the rhythms and melodies of these imitations.

But since music happens to be one of the pleasures, and virtue is concerned with enjoying, loving, and hating in the correct way, it is clear that one should learn and become habituated to nothing so much as correctly judging and enjoying decent characters and noble actions. And in rhythms and melodies there are the greatest likenesses to the true natures of anger and gentleness, and of courage and temperance besides, and of all the contraries of these, and of the other [components of] characters (this is clear from the facts; for we are altered in our souls when we listen to such things). But someone who is habituated to being pained or being pleased in the case of likenesses is close to being the same way in relation to the true things. For example, if someone enjoys contemplating an image of something due to no other cause than its shape, he will himself necessarily enjoy contemplating the very thing whose image he is contemplating.

It happens, however, that in other perceptible objects—for example, in those of touch and taste—no likenesses of [the components of] characters are present, although the objects of sight contain faint ones. For there are a few shapes that do contain such likenesses, and everyone[348] shares in this sort of perception; besides these are not likenesses of [the components of] characters, but rather the shapes and colors that are produced are signs of the components of characters, and these signs refer to the body[349] that is in the grip of the feelings. Nonetheless, insofar as there is a difference also in the contemplation of these, the young should not look at the works of Pauson, but rather those of Polygnotus or any other painter or sculptor able to represent character.

In melodies themselves there are imitations of the [components of] characters. And this is evident; for, to begin with, the nature of the harmonies is divided, so that listeners are put into distinct states and do not have the same way of responding to each of them. Instead, they respond to some—for example, the so-called Mixolydian—in a more mournful and anxious way; to others—for example, the more relaxed ones—they respond with softer thought; they are in a mean and settled state most of all in response to a distinct one, the Dorian (which seems to be the only one of the harmonies that produces this effect); and the Phrygian makes them ecstatic. For these points have been well discussed by those who have philosophized about this sort of education; for the evidence for their accounts comes from the facts themselves. It is the same way too with the rhythms (for some have a character that is

348. Rejecting the addition of οὐ.
349. Reading ἐπὶ τοῦ σώματος.

productive of stability, others one that is productive of movement, and of these some involve movements that are more unrefined, while others involve more free ones).

It is evident from all these considerations, then, that music has the capacity to make the character of our soul be of a certain quality. And if it has the capacity to produce this, it is clear that young people must be introduced to it and educated in it. And instruction in music is fitting to the nature of those at that stage of life; for the young, because of their age, do not voluntarily put up with anything that is unsweetened with pleasure, and music is something naturally sweet. Also there seems to be a certain natural affinity to harmonies and rhythms, which is why many of the wise say that the soul is a harmony,[350] others that it has a harmony.[351]

8.6
Music (3)

The question of whether they themselves should learn to sing and play an instrument or not—which is just the puzzle raised previously[352]—must now be spoken about. It is not unclear, then, that it makes a great difference to the development of certain qualities if someone shares in the works himself; for if people do not share in the works, it is impossible or difficult for them to become excellent judges of their quality. At the same time, children should have something to occupy them, and the rattle of Archytas, which they give to children to keep them from breaking things in the house, should be considered a good invention; for what is young cannot keep still. This, then, is fitting for children in their infancy, and education is a rattle for older children.

It is evident from these considerations that children must be educated in music in such a way that they are capable of sharing in the works. And it is not difficult to determine what is suitable or unsuitable for the different ages, or to solve the puzzle raised by those who say that the pursuit is unrefined. For, first, since it is for the sake of judging that one should participate in the works, because of this they must make use of the works while they are young, while when they are older they must give them up, but be able to judge which melodies are noble and enjoy them in the correct way, due to what they learned while they were young.

As for the criticism raised by some people, that music makes people unrefined, it is not difficult to resolve by investigating the extent to which those being educated in political virtue must participate in [musical] works, and what sorts of melodies and rhythms they must participate in, and further, on which sorts of instruments they must do their learning, for this too is likely to make a difference. For the resolution of the criticism depends on these considerations; for nothing prevents certain modes **1341ᵃ1**

350. Including Pythagoras of Samos (*DA* 407ᵇ30–408ᵃ28).
351. Including Plato, *Phaedo* 93c–94b.
352. 1339ᵃ33–ᵇ11.

of music from producing the effect mentioned.[353] It is evident, then, that learning music must neither impede later actions nor make the body unrefined and useless for military and political training—for current uses, on the one hand, and for later sorts of learning, on the other.[354]

This could be brought about in the case of learning if they did not exert themselves either with a view to competitions requiring craft-like expertise and exertion or with works that excite wonder or are extraordinary (which have now made their way into competitions and from there into education), but learned such things[355] too up to the point at which they are able to enjoy noble melodies and rhythms, and not only the common element in music, as even some of the other animals do, and the majority of slaves and children besides.

It is also evident from these considerations what sorts of instruments must be used. Pipes must not be introduced into their education, or any other instrument requiring craft-like expertise, such as the cithara or any other that may be of this sort, but rather those instruments that will make them good listeners either in their musical education or in any other sort. Further, the pipe has to do not with character, but rather with frenzy, and so the correct occasions for its use are those where contemplation has the capacity to effect a purgation rather than learning. And let us further add that a contrary factor with a view to its use in education is that playing the pipe prevents speech.

That is why our predecessors correctly rejected its use by the young and by free people, even though they had used it at first. For when they came to be more at leisure because of their greater prosperity, and greater-souled as regards virtue, and further, when on the basis of their works both before and after the Persian Wars they became presumptuous, they latched onto every sort of learning, making no distinction but pursuing them all. That is why they also included pipe playing among the things they learned. For even in Sparta a certain patron played the pipe himself to accompany his own chorus. And in Athens pipe playing became such a local custom that most free men pretty much participated in it, as is clear from the tablet that Thrasippus set up when he had been patron for Ecphantides.

Later, when they were better able to judge what does contribute to virtue and what does not, pipe playing was rejected, because of their experience with it. And the same thing happened to many other ancient instruments, such as the pectis, the barbitos, and those that contribute to the pleasure of people who listen for expressive effects,[356] the heptagon, the trigona, the sambukai,[357] and all those requiring a scientific virtuosity.

1341b1

353. I.e., that of making those who play them unrefined.
354. Reading χρήσεις . . . μαθήσεις.
355. Rejecting the addition of μὴ.
356. Reading χρωμάτων.
357. Stringed instruments of various sorts, akin to the harp.

The story told by the ancients about pipes is also reasonable. For they, as you know, say that Athena invented pipes but threw them away. There is nothing wrong with saying that the goddess did this out of annoyance at how pipe playing distorted her face, but the more likely explanation is that education in pipe playing does nothing for thought, and it is to Athena that we attribute scientific knowledge and craft knowledge.

We reject craft-like education, then, both in instruments and in the execution, and by "craft-like" I mean with a view to competitions; for the practitioner pursues this sort of education not for the sake of his own virtue, but for the sake of the pleasure of listeners, and an unrefined pleasure at that. That is why we judge its execution to belong not to free men but more to hired laborers, and they do indeed become unrefined as a result; for the target they set up as their end is a base one; for the contemplator of it, because he is unrefined, usually alters the music, so that he produces certain qualities in the craftsmen who perform for him, and in their bodies, because of the movements.

8.7
Music (4)

But further investigation must be made of harmonies and rhythms with a view to education, as to whether all the harmonies and all the rhythms must be used, or whether they must be divided, and next whether we should set up the same division for those who are exerting themselves with a view to education, or, third,[358] some distinct one. Since we see that music consists of melody-making and rhythms, what capacity each of these has as regards education should not be overlooked, and whether one must deliberately choose music that has a good melody or rather music that has a good rhythm.

Considering as correct, then, much that has been said about these things by some current experts on music as well as by those from philosophy who happen to be experienced in issues pertaining to musical education, we will deliver over to them those who wish to seek an exact accounting of each particular one. At the moment, however, we will draw distinctions in the way laws do, and speak about these things only in outline.

We accept the division made by some of those in philosophy who divide melodies into those relating to character, those relating to action, and those relating to ecstasy, claiming that the harmonies are by nature akin to these particular melodies, one being related to one melody, and another to another.

We say, though, that music should not be used for the sake of one benefit but several; for it is for the sake of both education and purgation (as to what we mean by

358. Retaining τρίτον.

purgation, we will speak of it in simple terms now, but again and more perspicuously
40 in our discussions concerning poetics[359]), and third, for passing the time, for rest, and for the relaxation of one's tensions.

1342a1 Hence it is evident that all the harmonies are to be used, but that they are not all to be used in the same way. Instead, with a view to education one must use those that most have to do with character, but for listening to while others perform them, both those that relate to action and those that relate to ecstasy. For the feeling that
5 strongly affects some people's souls is present in everyone, although to a different degree, either greater or lesser—for example, pity and fear, and ecstasy besides; for in fact there are certain people who are prone to being possessed as a result of this movement.[360] But under the influence of sacred melodies (when they make use of the ones that induce a frenzy in their souls), we see that they calm down, as if they had
10 received medical treatment and a purgation. The same thing, then, must be undergone by those who are prone to pity or fear or to feelings generally, and by others to the extent that each of these things falls to them, and they all get, together with pleasure, a certain purgation and feel their burdens lightened.[361] In a similar way, the
15 purging[362] melodies provide harmless enjoyment to human beings.

That is why the use of these sorts of harmonies and these sorts of melodies must be permitted to competitors who perform music for the theater. But since the theater audience is twofold, one free and well educated, the other unrefined, composed of
20 unrefined people, hired laborers, and other people of that sort, the latter too must be provided with competitions and spectacles with a view to relaxation. And just as their souls are distorted from the state that is in accord with nature, so too there are harmonies that are deviations and melodies that are strained and involve excessive expressive effects, and what produces pleasure for each person is what is akin to his
25 nature. That is why authorization to use a certain sort of music of this kind should be given to those who compete before a theater audience of this sort.

But, as has been said,[363] with a view to education the melodies that have to do with character must be used as well as harmonies of this sort. And the Dorian is of this
30 sort, as we said previously,[364] but one should accept any other that passes the examination carried out for us by those who share in the pursuit of philosophy and musical education. The Socrates of the *Republic* was not correct, however, to retain only the Phrygian along with the Dorian,[365] especially since he includes the pipe among the
1342b1 instruments he rejects. For the Phrygian has the same capacity among harmonies as

359. Not in the extant *Poetics*.
360. Either the movement that constitutes the melody or the movement in the soul that constitutes the feeling produced by it.
361. *Po.* 1449b24–28.
362. Reading καθαρτικὰ.
363. 1342a2–3.
364. 1340b3–4.
365. 399a–e.

the pipe has among instruments; for both are productive of frenzy and expressive of feeling. For all Bacchic frenzy and all movements of that sort are, among instruments, most characteristic of the pipe, while among the harmonies, the Phrygian melodies are the ones that are suited to these.

Composition makes this clear. For example, the dithyramb seems by general agreement to be Phrygian. And those who comprehend this matter mention many examples of this, notably the fact that when Philoxenus tried to compose a dithyramb—*The Mysians*—in Dorian, he could not do it, but as a result of the dithyramb's very nature fell back into Phrygian again, which is the harmony naturally appropriate to it.

As for the Dorian, everyone agrees that it is the most steady and has most of all a courageous character. Further, since we praise the mean between extremes, and say that it is what we must pursue, and the Dorian has this nature in relation to the other harmonies, it is evident that being educated in the Dorian melodies is more appropriate for younger people.

There are two targets: the possible and the appropriate. And in fact each individual should more undertake things that are possible and appropriate. But these things are determined by one's stage of life. For example, it is not easy for people exhausted by age to sing harmonies that are strained; rather, nature suggests the relaxed harmonies for their stage of life. That is why some of those concerned with music rightly criticize Socrates for this as well, that he rejected the relaxed harmonies for the purposes of education not because they have the capacity that drink has, on the supposition that they conduce to drunkenness (for drink instead produces Bacchic frenzy) but because they make us weak.[366] So, with a view also to that future stage of life, old age, one should avail oneself of harmonies of this sort and melodies of this sort.

Further, if there is a certain sort of harmony that is appropriate for the age of children, because it has the capacity to provide both order and education at the same time, as appears to be particularly the case with the Lydian harmony, then it is evident that these three things must be made the defining marks in education: the mean, the possible, and the appropriate.

366. *Republic* 398e.

RHETORIC*

BOOK 1

1.1
What Rhetoric Is

Rhetoric is the counterpart of dialectic; for both are concerned with such common things as are, in a way, known to all and belong to no definite science. That is why all, in a way, share in both; for to a certain extent all try both to examine and to uphold an argument, as well as to defend themselves and accuse someone. Among ordinary people, some do these things extemporaneously, others due to a state acquired by habit. But since both ways are possible, it is clear that the same things could be done in a methodical way; for it is possible to get a theoretical grasp on the cause due to which some succeed because of habit and others because of chance; and getting such a grasp, all would immediately agree, is the work of a craft. **1354ª1**

As things stand, those who have put together studies on the craft of speeches have provided (one might almost say) no part of it;[1] for only the means of persuasion are within the province of craft; the other things are appendages. But these writers say nothing about enthymemes, which are precisely the body of the means of persuasion, but mostly busy themselves with matters that are outside the thing at issue; for accusation, pity, anger, and such feelings of the soul do not have to do with the thing at issue, but are related to the judge. So if all trials were conducted as they now are, at any rate, in some cities, especially those that are in good legislative order, these writers would have nothing to say; for everyone thinks that the laws should proclaim this way of doing things, and some even make use of them and prohibit speaking of matters outside the thing at issue, as they do in the court of the Areopagus, which correctly legislates against this; for one should not distort [the judgment of] the judge by arousing anger, fear, or pity in him; for this would be as if someone who is going to use a standard [first] made it crooked. Further, it is evident that the task of the opponent is nothing at all outside of proving that [the thing at issue] is or is not the case, or did or did not occur. As to whether it is a large thing or a small one, however, or a just or an unjust one, whatever the legislator has not defined, the judge should doubtless recognize for himself and not learn from the disputing parties.

* Translated by C. D. C. Reeve. Text R. Kassel, *Aristotelis Ars Rhetorica* (Berlin, 1976).

1. Reading οὐδὲν ὡς εἰπεῖν.

Above all, it is fitting for laws that are correctly laid down to define everything themselves, wherever possible, and leave the fewest things up to the judges: first, because it is easier to find one or a few than to find many who are practically
1354ᵇ1 wise and capable of legislating and judging; next, legislation comes about on the basis of long-term investigations, while judgments are made on the spur of the moment, so it is difficult for the judges to give justice and advantage their due.
5 The most important factor of all, however, is that the judgment of a legislator is not a particular one, but is rather about future things and indeed about what is universal, while the assemblyman and the judge are already judging about present and definite issues, in relation to which they already feel both love and hatred, and with which their own private advantage is already knitted together, so that they
10 are no longer capable of adequately seeing the truth, but instead their own private pleasure or pain overshadows their judgment. As regards other matters, then, as we say, the judge should be put in control of the fewest things, but where what has happened or has not happened, will be or will not be, or is or is not are concerned,
15 it is necessary to leave them up to judges; for it is not possible for the legislator to foresee them.

If this is so, however, it is evident that those who define the other things are attempting to treat matters outside the thing at issue as being within the province of craft—for example, what the introduction or the narration should contain, as well as each of the other parts (for they busy themselves with nothing else except how to
20 produce a certain quality in the judge), while about the means of persuasion that are within the province of craft they prove nothing, but it is on the basis of these that one would become enthymematically competent.

This is why indeed, although the same methodical inquiry is concerned with public and judicial oratory, and although public oratory is a nobler study and more suited to a citizen than the one concerned with transactions, these writers say nothing about
25 the former, but all try to treat speaking in court as within the province of craft. This is because, in cases of public oratory, it furthers the work less to speak of matters outside the thing at issue and because public oratory is less malicious than judicial oratory, because more common in its scope.[2] For there the person making a judgment is judging about his own affairs, so that no other thing is needed except to demonstrate
30 that things are as the advisor says they are. In judicial cases, by contrast, this is not enough, but rather it furthers the work to win over the listener; for the judgment is about other people's affairs, so that the judges, looking to their own affairs, and listening with a view to gratification, surrender themselves to the opponents, and do not
1355ª1 judge. That is why, as we said previously,[3] in many places the law prohibits speaking outside the thing at issue [in court], while in deliberative contexts the people making the judgment adequately keep a watch over this.

2. Reading καὶ ἧττον ἐστι . . . κοινότερον.
3. 1354ª22–23.

Since it is evident that the methodical inquiry that is within the province of craft is concerned with the means of persuasion and a means of persuasion is a sort of demonstration (for we are most persuaded when we take something to have been demonstrated), and a rhetorical demonstration is an enthymeme (and this is, one might almost say, unconditionally the most controlling means of persuasion),[4] and an enthymeme is a sort of deduction (and it belongs to dialectic, either as a whole or to one of its parts, to see about every sort of deduction), since all that is so, it is clear that the person who is best able to get a theoretical grasp on the materials on the basis of which, and the manner in which, a deduction comes about is also the one who is most competent in the use of enthymemes, when he also grasps what sorts of things an enthymeme is concerned with and what sorts of differences there are between it and logico-linguistic deductions; for it belongs to the same capacity to see the truth and what is like the truth, and at the same time human beings are naturally adequate as regards the truth and in most cases hit upon it. That is why the capacity to aim at and hit upon the acceptable beliefs belongs to the person who has a similar capacity with regard to the truth.

It is evident, then, that the other writers treat matters outside the thing at issue as within the province of craft, and also evident why they lean more toward judicial oratory.

Rhetoric is useful because true things and just things are by nature stronger than their contraries, so that if judgments are not in accord with what is fitting, it must be because of these[5] that they are defeated, and this merits criticism.

Further, not even the possession of the most exact scientific knowledge would make it easy for us in speaking to persuade some listeners on the basis of it; for argument in accord with scientific knowledge is teaching, but teaching is impossible [in their case]. Instead, it is necessary to produce our means of persuasion and arguments out of common things, as we said in the *Topics* about encounters with ordinary people.[6]

Further, one should be capable of persuading people of contraries, just as in the case of [dialectical] deductions, not so as to do both in action (for one should not persuade people of base things), but in order that it not escape our notice how things stand, and, if someone else uses arguments in an unjust way, so as to be able to refute them for ourselves. None of the other crafts deduces contraries; dialectic and rhetoric alone do this; for both are alike concerned with contraries. To be sure the underlying things at issue are not alike. On the contrary, true and better ones are always by nature more easily deduced and unconditionally more persuasive.

In addition, it would be absurd if not being capable of defending oneself with one's body is shameful, while not being capable of doing so with speech were not

4. Reading καὶ ἔστι . . . πίστεων.
5. Reading δι' αὐτῶν instead of δι'αὐτὸν.
6. 101[a]26–36.

1355b1 shameful; for the latter is more special to a human being than the use of the body. [If it is objected] that the one who unjustly uses such a capacity for [making] speeches might do great harms, that objection applies to all good things except virtue, and especially to the most useful ones, such as strength, health, wealth, and generalship; for by using these justly someone can confer the greatest benefits, and by using them unjustly, the greatest harms.

It is evident, then, that rhetoric does not deal with a definite kind, but is like dialectic, and that it is useful, and that its work is not to persuade but to see the persuasive factors belonging in each case, just as in all the other crafts; for it is not the work of medicine to produce health either, but rather to promote health as far as possible; for even to those who are incapable of partaking in health it is nonetheless possible to give good treatment. In addition, it is evident that it is a work of the same craft to see what is persuasive and what is apparently persuasive, just as in the case of dialectic it is to see the deduction and the apparent deduction; for sophistic is what it is in virtue not of its capacity but of the deliberate choice. Here, in the case of rhetoric, however, one person is an orator in virtue of his scientific knowledge, another in virtue of his deliberate choice, while there, in dialectic, a sophist is so called in virtue of his deliberate choice, and a dialectician is so called not in virtue of his deliberate choice, but in virtue of the capacity he has.

Let us now try to discuss the methodical inquiry itself, and the manner in which and the materials on the basis of which we will be capable of achieving the goals we set down. Let us, then, as it were, make a fresh start, and, having defined again what rhetoric is, state the rest.

1.2
Means of Persuasion; Likelihoods, Signs, and Proofs; Common and Special Topics

Let rhetoric, then, be a capacity to get a theoretical grasp on what is possibly persuasive in each case. For this is not the work of any other craft whatever; for each of the others is capable of teaching and persuading about its own subject matter—for example, medicine about healthy and unhealthy things, geometry about the coincidental affections of magnitudes, and arithmetic about numbers, and likewise the rest of the crafts and sciences. But rhetoric seems to be able to get a theoretical grasp on what is persuasive on (one might almost say) any given subject matter. That is why we say that, as craft-like, it is not concerned with a special, definite kind.

Among the means of persuasion, some are outside the province of craft, while others are within the province of craft. By "outside the province of craft" I mean those that are not provided by ourselves [as orators] but are there at the start—for example, witnesses, results of torture, contracts, and the like. And by "within the

province of craft" I mean those capable of being furnished by the methodical inquiry and ourselves. So one must use the former and find the latter.

Among the means of persuasion that proceed through speech, there are three **1356^{a}1** forms; for some depend on the character of the speaker, some on disposing the listener in some way, and some on the argument itself, due to its proving or appearing to prove something.

Persuasion is through character whenever the speech is stated so that it makes 5 the speaker worthy of trust; for we trust decent people more, and more readily, on simply all subjects, and trust them entirely where there is no exactness but rather no belief either way. This should come about through the speech, however, not through prior belief that the speaker is of a certain quality. For it is not the case, as some claim, who treat the subject as within the province of craft, 10 that the decency of the speaker contributes nothing to persuasiveness; rather, character is pretty much (one might almost say) the most controlling factor in persuasion.

Persuasion is through the listeners whenever they are led by the speech to have a certain feeling; for we do not give the same judgments pained and pleased, or loving 15 and hating. It is with this, and only with this, we say, that those people busy themselves who now treat the subject as within the province of craft. The details about this will be made clear when we speak about feelings.[7]

Persuasion is through argument whenever we make clear the truth or the apparent truth on the basis of what is persuasive in each case.

Since, though, the means of persuasion are through these things, it is evident that 20 to get hold of them a person must be capable of deducing and of getting a theoretical grasp on character, on the virtues, and third on feelings—that is, on what each of them is and what sort of thing, and from what it arises and in what way. So it follows that rhetoric is a sort of offshoot of dialectic and of the study concerned with ethics, 25 which it is right to call "politics." That is why rhetoric cuts the same figure as politics, as do those who pretend to a knowledge of it—some through lack of educatedness, some through boastfulness, and some through other human causes. For it is a part 30 of dialectic, and similar to it, as we also said at the start;[8] for neither of them is the science of how things stand with some definite [kind], but rather both are capacities for providing arguments.

About their capacities themselves, then, and how they stand in relation to each other, pretty much enough has been said.

{In cases of persuasion that operate through proving or appearing to prove some- 35 thing, just as in dialectical ones there is induction, deduction, and apparent deduc- **1356^{b}1** tion, so it is like that here as well; for a paradigm is an induction, and an enthymeme a deduction, and an apparent enthymeme an apparent deduction. I call a rhetorical

7. 2.2–11.
8. 1354^{a}1.

deduction an "enthymeme," and a rhetorical induction a "paradigm."}[9] And everyone produces means of persuasion through proving something by means either of paradigms or of enthymemes, and of nothing beyond these. So if indeed it is, in general, necessary to prove anything whatever either by deduction or by induction (and this is clear to us from the *Analytics*[10]), it necessarily follows that enthymemes and paradigms are, respectively, the same as deductions and inductions.

The difference between a paradigm and an enthymeme is evident from the *Topics*[11] (for there deduction and induction were spoken about previously), that to prove on the basis of many similar cases that things are a certain way is an induction in dialectic and a paradigm in rhetoric, while to prove that if some things are so, something beyond them follows by their being so, whether universally or for the most part, is called in dialectic a "deduction" and in rhetoric an "enthymeme." And it is evident too that each form of rhetoric has [its] advantage; for what is said in the *Methodics* is so in these cases as well; for some speeches are paradigmatic, others enthymematic; and speakers are the same way, some are paradigmatic, others enthymematic. Arguments through paradigms are not less persuasive, but enthymematic ones are more applauded. The cause, and how each should be used, we will discuss later. Now, though, we will define these things themselves more clearly.

For since the persuasive is persuasive to someone (and is either immediately persuasive and convincing by itself or seems to be proved by such things), and since no craft investigates what is particular (for example, medicine does not investigate what is healthy for Socrates or Callias but for a person of such-and-such a sort or for persons of such-and-such a sort—for this is in the province of craft, while what is particular is unlimited and is not scientifically knowable), rhetoric does not get a theoretical grasp on a particular acceptable belief either (for example, one adopted by Socrates or Hippias) but on one adopted by people of such-and-such a sort, just as in the case of dialectic.

For even dialectic does not deduce from random things (for even to crazy people some things appear to be so) but from things [that appear to be so] to those in need of argument, as rhetoric does from things [that appear to be so] to those already **1357ᵃ1** accustomed to deliberate among themselves. But rhetoric's work is concerned with the sorts of things we deliberate about and have no crafts for, and in the presence of such listeners as are not capable of getting a comprehensive view of many things or of rational calculation from a distant [starting-point]. And we deliberate about things that appear to admit of alternative possibilities; for no one deliberates about things that they take to be incapable of being otherwise than they have been, will be, or are; for there is nothing more [to do about it].

9. Probably out of place.
10. *APr*. 2.23–24, *APo*. 71ᵃ1–11, 1.18.
11. 100ᵃ25–30, 105ᵃ10–12.

It is possible to deduce and draw conclusions either from previous deductions or from things that are not deduced, but which are in need of being deduced because they are not acceptable beliefs. The former, however, are of necessity not easy to follow due to their length (for the judge is assumed to be a simple person), while the latter are not persuasive because they are not drawn from things that are agreed nor from acceptable beliefs.

So it is necessary for both an enthymeme and a paradigm to be concerned with things that for the most part admit of being other than they are (a paradigm being an induction, an enthymeme being a deduction), and to be composed of few premises and fewer often than those that compose the primary deduction;[12] for if one of these is known, there is no need to state it; for the listener himself supplies it. For example, to show that Dorieus was the victor in a competition in which the prize was a crown, it is enough to say that he won a victory in the Olympic Games; there is no need to add that the prize in the Olympic Games is a crown; for everyone knows that.

Since few of the premises from which rhetorical deductions are composed are necessary (for most of the things that judgments and investigations are concerned with admit of being otherwise; for people deliberate about and investigate what they do in action, and things done in action are all of this kind and none—one might almost say—is necessary), and since things that happen for the most part and are possible must be deduced from other such things, and necessary ones from necessary ones (and this is also clear to us from the *Analytics*[13]), it is evident that while some of the premises on the basis of which enthymemes are stated will be necessary, the majority will hold for the most part. But enthymemes are based on likelihoods and signs, so that it is necessary that each of these be the same as the corresponding one of the former.

A likelihood is what comes about for the most part, not however simply so, as some people define it,[14] but rather when it concerns things that admit of being otherwise, standing in relation to what it is a likelihood in relation to as the universal stands to the particular.

Among signs, on the other hand, some are related as particular to universal, others as universal to particular. Among these, a necessary sign is a proof (*tekmêrion*), while that which is not necessary has no name indicating the difference. I call "necessary" those from which a deduction comes about. That is why indeed such a sign is a proof; for when people think that it is not possible to refute what has been stated, they think they are putting forward a proof, on the supposition that the matter has been proved and come to an end; for *tekmar* and *peras* are the same in the ancient tongue.[15]

An example of signs related as particular to universal is if someone were to say that, since Socrates is wise and just, it is a sign that the wise are just. This is indeed

12. I.e., the fully explicit deduction that is known to speakers and shapes their speech.
13. *APr.* 43^{b}32–36, *APo.* 87^{b}22–25.
14. The reference is unclear.
15. Both refer to a limit or end-point: "come to an end" is *peperasmenon*.

a sign, but it is refutable, even if true of the case mentioned; for it is non-deductive. But if someone were to say that there is a sign that someone is ill, for he has a fever, or that a woman has given birth, because she has milk, it is a necessary one. And among signs, this is precisely what proof alone is; for it alone, if true, is irrefutable. An example of signs related as universal to particular is if someone were to say that there is a sign that a person is feverish, for he is breathing rapidly. This too is refutable, even if true [of the person in question]; for it is possible to breathe rapidly and not be feverish.

What a likelihood is, then, what a sign is, and what a proof, and in what way they differ has now been stated. In the *Analytics*[16] we have defined them in a more explicit way, and what the cause is due to which some are non-deductive and others deductive.

We have said[17] that a paradigm is an induction and what sorts of things it is an induction about. It is not the relation of part to whole, of whole to part, or of whole to whole, but of part to part, and like to like—and it is a paradigm when both fall under the same kind, but one is better known than the other. For example, [someone might claim] that Dionysius is aiming at tyranny in demanding a bodyguard; for in fact Pisistratus, when aiming at tyranny previously, demanded a bodyguard and, having got one, made himself tyrant, and Theagenes did the same in Megara. And the others that [the listeners] know all become paradigms for Dionysius, of whom they do not yet know whether it is because of this that he demands a bodyguard. And all these fall under the same universal, that someone aiming at tyranny demands a bodyguard.

The things from which those means of persuasion that seem to be demonstrative
1358a1 are composed have now been stated.

There is a very great difference among enthymemes, however, that has indeed escaped the notice of pretty much everyone, even though the very same difference is also found in the dialectical methodical investigation of deductions;[18] for some enthymemes are in accord with rhetoric, just as some are in accord with the dialectical methodical investigation of deductions, while others are in accord with the other crafts and capacities, whether those in existence or those not yet acquired. That is why the difference escapes the notice of these individuals,[19] and the more they grasp in accord with a mode [of inquiry], the more they stray beyond these.[20] This will be more perspicuous if stated in more detail.

For I mean that dialectical and rhetorical deductions are those concerned with what we call "topics," which are common[21] when they concern what is just, what

21. Reading κοινοὶ.

is natural, what is political, and many things that differ in form—for example, the topic of the more and the less; for it is no less possible to state a deduction or an enthymeme based on it about matters of justice than it is about matters of natural science, or about anything else whatever, and yet these things differ in form. Special topics, on the other hand, are the ones based on premises concerning a given form and kind. For example, there are premises concerning natural things on which neither an enthymeme nor a deduction can be based concerning ethical things, and about the latter there are others on which none can be based concerning natural ones. And the same holds in all cases. The common topics will not make someone wise about any kind; for they are not concerned with any underlying subject.[22] But as to the special ones, the better someone is at selecting premises, [the more] he will—without noticing it—produce a science that is distinct from dialectic and rhetoric; for if he hits upon starting-points, it will no longer be dialectic or rhetoric, but instead will be that science whose starting-points he possesses.

And yet most enthymemes are based on these, the so-called forms, the ones that are particular and special, fewer on the common topics. As in the *Topics*,[23] then, so also here a distinction must be made between the forms and the topics, on the basis of which enthymemes are selected. By "forms" I mean the premises special to a given kind, and by "topics" those equally common to all. We may begin, then, with the forms. But let us first take up the kinds of rhetoric, so that having determined how many they are, we may separately take up their elements and premises.

1.3
The Three Kinds of Rhetoric

The forms of rhetoric are three in number; for the listeners to speeches are of the same number; for a speech is composed of three elements: the speaker, what he speaks about, and whom he addresses. And the end it aims at relates to him—I mean, the **1358^{b}1** listener. And the listener must be either a spectator or a judge, a judge of either things past or things future. For example, an assemblyman is a judge concerning things future, a judge one concerning things past, and a spectator one concerning capacity.[24] So of necessity there would be three kinds of speeches belonging to rhetoric: deliberative, judicial, and epideictic.

A deliberative one is either exhortation or dissuasion; for both those who serve as private advisors and those who speak publicly in the common assembly always do one or the other of these. A judicial one is either accusatory or defensive; for it is necessary for the opponents to make one or the other of these. And an epideictic one consists in either praise or blame. Moreover, the times belonging to each of these

22. I.e., any kind (*Met.* $1016^{a}26$).
23. No such distinction is made in the extant *Topics*.
24. Reading ὁ δὲ περὶ τῆς δυνάμεως ὁ θεωρός.

are to the advisor, the future (for whether exhorting or dissuading he advises about future things); to the judicial speaker, the past (for it is concerning what has been done in action that he always accuses or defends); and to the epideictic speaker the present has the most control (for all speakers praise or blame with regard to qualities that belong at present), although they often also make use of past things by way of recalling them, and of future ones by way of anticipating them.

The end aimed at by each of them is distinct—that is, three for three: to the deliberative speaker the end is the advantageous and harmful (for the one who exhorts advises something as a better course, while the one who dissuades, dissuades from something as a worse one), and he includes the others—just or unjust, noble or shameful—as ancillary to this; to judicial speakers the end is the just and the unjust, and they too include the others as ancillary to these; and to those praising and blaming the end is the noble and the shameful, and they too take in the others as an assistant to these.

A sign that what has been mentioned is the end of each is that sometimes speakers might not dispute about the other things—for example, a judicial speaker might not dispute that he had done something or done harm, but he would never concede that he had done an injustice; for then there would be no need of a trial. Similarly, deliberative speakers, though they often let the other things go, would never concede that they are advising non-advantageous things or that they are dissuading from beneficial ones, but often they give no thought to [proving] it not unjust to enslave neighbors or those who have done no injustice. And similarly those who praise and blame do not investigate whether the person concerned has done advantageous things or harmful ones, but often take it as a matter for praise that, neglecting what was profitable to himself, he did something noble—for example, they praise Achilles because he went to the aid of his companion Patroclus,[25] knowing that he himself must die, though he could have gone on living. To him, a death of this sort was nobler, although the advantageous thing was to live.

It is evident from what has been said, then, that the speaker must first possess premises concerning these matters; for proofs, likelihoods, and signs are rhetorical premises, a deduction is wholly composed of premises, and an enthymeme is a deduction composed of the premises that were mentioned. And since it is not impossible things that will be done or can have been done through action, but rather possible ones, and since what has not occurred nor will occur can neither have been done nor will be done, it is necessary for the deliberative, judicial, and epideictic speaker to possess premises dealing with the possible and the impossible, and whether something has happened or not, or will or will not happen. Further, since all speakers, whether praising or blaming, exhorting or dissuading, accusing or defending, not only try to prove the things we mentioned but also that the good or the bad, the noble or the shameful, the just or the unjust, is great or small, either intrinsically

25. Homer, *Iliad* 18.94–137.

speaking or in comparison to each other, it is clear that it will be necessary also to possess premises dealing with greatness and smallness and the greater and the lesser, both universally and in particular—for example, what is the greater or lesser good, or unjust action or just action—and similarly for the others.

The things concerning which it is necessary to get hold of premises have now been stated. Next we must distinguish between each of them individually: what things deliberative speech is concerned with, what things epideictic speeches are concerned with, and third what things judicial speeches are concerned with.

1.4
Deliberative Oratory (1)

First, then, the sorts of good things and bad ones that the deliberative speaker gives advice about must be grasped, since it is not about all, but about those that may possibly come to be or may not, while about those that of necessity either are or will be, or that cannot be or come to be, there is no giving advice. Nor indeed is there any about all possible things; for some good things among those that can come to be, or not come to be, are by nature or by luck, and about those it does not at all further the work to give advice. But it is clear that there is giving advice concerning what we deliberate about: things that can naturally be brought back to ourselves, and whose starting-point of coming to be is up to us; for we investigate as far as this: until we discover whether something is possible or impossible for us **$1359^{b}1$** to do in action.

But to enumerate particular by particular in an exact way and divide into forms the things that people are accustomed to deliberate about in public, or to define them, as far as is possible where they are concerned, in accord with the truth, is not an inquiry we should undertake at the present moment, because this is not a matter for the craft of rhetoric—to which many more things than the ones within its own proper theoretical grasp are at present assigned—but for a more thought-involving and more truth-focused one; for precisely what we said previously[26] is true, that rhetoric is composed of the science of analytics and of ethics, and is like dialectic, on the one hand, and sophistical arguments, on the other. And to the extent that someone tries to establish dialectic or rhetoric not just as capacities but as sciences, to that extent he will—without noticing it—obscure their nature by the change, re-establishing them as sciences of certain underlying things, rather than only of arguments. Nonetheless, let us now discuss as much as it furthers the work to go through, while still leaving the investigation of the rest to the science of politics.

Indeed, of the things that all people deliberate about and deliberative speakers speak in the assembly about, pretty much the most important are five in number.

26. $1356^{a}25–26$.

And these are finances, war and peace, further, the defense of the country, imports and exports, and legislation.

So the one who is going to give advice about finances must know: what sorts of public revenues there are and how extensive they are, so that if any is omitted it may be added, and if any is too small it may be increased; further, all the expenses of the city, so that if any is superfluous, it may be eliminated, and if any is too large it may be reduced; for people become wealthier not only by adding to what they have, but also by eliminating expenses. It is not possible, though, from experience of matters relating to one's private affairs alone to get a comprehensive view of these; rather, it is necessary, with a view to giving advice about them, to be disposed to inquire about what has been discovered on the part of others.

As regards war and peace, it is necessary to know: the military capacity of the city, both how great it is already and how great it can become, of what sort it is and what else might be added to it; further, what wars it has waged and in what way. And it is necessary to know these not only about one's own city but also about bordering ones. And it is necessary to know with whom it is likely to have a war, in order that peace may be maintained with the stronger ones, and that war with weaker ones may be up to it. And one must know whether their military capacities are like or unlike [those of his own city]; for it is also possible to be advantaged or disadvantaged with respect to that. With reference to these matters too, it is necessary to get a theoretical grasp not only on the wars of his own city but also on those of others, and how they ended; for it is from like causes that like results naturally come about.

Further, in regard to defense of the country one must not overlook how it is to be defended, but one should also know the size of the defense force and its form, as well as the locations of the guardhouses (and this is impossible without having experience of the country), in order that it may be increased if it is too small, eliminated if superfluous, and suitable places kept a watch over instead.

Further, concerning nourishment, one must know how much is adequate for the city and of what sorts, whether coming from the city itself or importable, and which sorts should be exported and which sorts imported, in order that contracts and treaties with the relevant ones be made; for there are two one must closely guard the citizens from having disputes with: those that are stronger and those that are useful for the present purposes.

With a view to safety, it is necessary for [a deliberative speaker] to be capable of getting a theoretical grasp on all these things, but not least to have knowledge of legislation; for it is in the laws that the preservation of the city is based. So it is necessary to know how many forms of constitution there are, and what sorts of things are advantageous for each, and by what sorts—whether proper to it or the contrary—it is naturally destroyed. By "being destroyed by things proper to itself" I mean that except for the best constitution, all the others are destroyed by loosening or tightening—for example, democracy becomes weaker not only when loosened, so that finally it ends up being an oligarchy, but also when tightened to excess, just as

both a hook nose and a snub nose do not only reach the mean when loosened, but if they become exceedingly hooked or snub they are arranged in such a way that they do not seem to be a nose at all. In relation to legislation it is useful for the person who has a theoretical grasp on the matter not only to get knowledge of what constitution is advantageous on the basis of its past but also to know the constitutions present in others, that is, which ones are fitting for which sorts of people. So it is clear that, in relation to legislation, reports of world travelers are useful; for there one can get hold of the laws of [foreign] nations, and in relation to deliberations about war, the researches of those writing about actions. All these are a work of politics, however, not of rhetoric.

These, then, are the most important things that someone who is going to give advice must possess premises about. But let us now go back and state the ones on the basis of which one should exhort or dissuade on these and the other matters. **$1360^{b}1$**

1.5
Deliberative Oratory (2)

Both for each private individual and for all people in common there is pretty much a sort of target they aim at in what they choose and avoid. And this, to speak in headline form, is happiness and its parts. So, for the sake of having a paradigm, let us get hold of what happiness is, simply speaking, and of what its parts are composed; for every sort of exhortation and dissuasion is concerned with it and with the things that lead to it or are contrary to it; for the things that provide happiness or some part of it, or which produce more rather than less of it, are the things that one should do in action, while the things that destroy or impede it or produce the contraries [of it or its parts] are the ones that one should not do.

Let happiness, then, be doing well in action involving virtue, or self-sufficiency for living, or the pleasantest life involving security, or as abundance of possessions and bodies, involving the capacity to guard these and make use of them in action; for pretty much everyone agrees that happiness is one or more of these.

If, then, happiness is something of this sort, its parts must be good breeding, having many friends, having good friends, wealth, having good children, having many children, having a good old age; further, the virtues of the body (for example, health, noble beauty, strength, stature, athletic capacity), reputation, honor, good luck, virtue; for a person would be most self-sufficient if he had both the goods internal to himself and the external goods; for there are no others beyond these. (The internal ones are those relating to the soul and those in the body, while good breeding, friends, wealth, and honor are external.) Besides these we think that he should possess certain capacities and luck; for that way his life would be most secure. Let us now, in a similar way, get hold of what each of these is.

Good breeding in the case of a nation or a city, then, means that its members are indigenous or ancient, that its first leaders were distinguished men,[27] and that from them have sprung many who were distinguished for qualities we admire. The good breeding of an individual may result from the male side or from the female one, requires legitimacy [in birth and citizenship] on both, and—as in the case of a city—
35 that the earliest ancestors were notable for virtue, wealth, or something else that is highly esteemed, and that many distinguished people—men and women, young and old—come from the stock.

1361ᵃ1 Having good children and many children is quite clear. As regards the community, it consists in a large number of young people who are good—good in accord with virtue of body (such as stature, noble beauty, strength, and athletic capacity). As for the virtues [of a young person's] soul, these are temperance and courage. And for the individual, having good children and many children consists in having many
5 of his own and of the sort described, both female and male. In the case of female ones, virtue of body consists in noble beauty and stature, and of soul, in temperance and being industrious without being un-free. And alike for the individual and for the community, both with regard to women and with regard to men, each of these
10 qualities must be sought. For those, like the Spartans, in which the qualities of the women are bad, are pretty much half not happy.

The parts of wealth are a quantity of money, land, the possession of numerous large and nobly beautiful estates; further, possession of movables and of slaves and cattle distinguished by their number and noble beauty; and all these privately owned,
15 secure, free, and useful. And the things that are fruitful are more useful, while the things that are related to indulgence are more free. By "fruitful" I mean those that are sources of income; by "related to indulgence" I mean those from which nothing at all worth mentioning comes about beyond the use. The definition of "secure" is
20 what is possessed in such places and in such a way that the use of it is up to the owner himself. And whether something is privately owned or not is a matter of when its alienation is up to him, and by "alienation" I mean gifting or selling. And, in general, being wealthy consists more in using than in possessing; for in fact it is in the activation and use of such things that wealth consists.

25 Good reputation consists in being considered an excellent person by all, or having some quality of the sort that is sought by all, either by ordinary people, by the good, or by the practically wise.

Honor is a sign of a good reputation as a benefactor, and those who have been benefactors are justly honored above all; nonetheless, those who are capable of benefaction are honored too. Benefaction is either with regard to security [of life] and to
30 whatever is a cause of life, or to wealth, or to some other good things: those that are not easy to acquire, whether in general, in this particular place, or at this particular time; for many people gain honor for things that seem small, yet the places and the

27. Reading ἐπιφανεῖς.

opportune times are the causes of honor. The parts of honor are sacrifices, memorial inscriptions in verse or prose, privileges, grants of land, front seats, public burial, statues, public maintenance, the barbarian ones (for example, prostrations and standings aside), and gifts that are considered honors in the given place. For in fact a gift is the giving of a possession and a sign of honor, which is why both lovers of wealth and lovers of honor seek them; for the gift is to both of them what they want; for it is both a possession, which is sought by those who love wealth, and involves honor, which is **1361**^{b}**1** sought by those who love honor.

Virtue of body is health, and of such a sort that we are free from sickness when making use of our bodies; for many are healthy in just the way Herodicus was said to be, whom no one would count happy in matters of health, because they abstain from everything human, or nearly everything.

Noble beauty is a distinct thing at each stage of life. In a young man noble beauty consists in having a body useful for exertions, both for those related to the racecourse and those related to competitions requiring physical strength, and, in relation to indulgence, pleasant to look at. That is why pentathletes are the most nobly beautiful, in that they are naturally adapted for physical strength and for speed at the same time. In someone in his prime, noble beauty consists in being naturally adapted for the exertions of war, while having a pleasant and at the same time fearsome appearance. In an old man, it consists in being adequate for such exertions as are necessary, not painful [to look at] due to not having any of the disfigurements of old age.

Strength is the capacity to move something else in the way one wishes, and moving something else necessarily consists in pulling, pushing, lifting, squeezing, or crushing, so that someone strong is strong in all or some of these.

Virtue of stature consists in exceeding ordinary people in height, depth, and breadth, but in such a way that movements are not made slower due to the excess.

Virtue of body in athletic competitions is a combination of size, strength, and speed (and in fact the one who is speedy is strong); for in fact the one who is capable of throwing his legs in a certain way, moving them quickly and for a distance, is a good runner; the one who can squeeze and hold down is a good wrestler; the one who can thrust someone away with a blow of his fist is a good boxer; and the one who can do the latter two is a good pancratist; and the one who can do all of them is a good pentathlete.

A good old age consists in aging slowly and with freedom from pain; for no one who ages quickly is aging well, nor if he ages scarcely but painfully. And it comes from the virtues of body and from luck; for unless he is disease-free and strong, he will not be free from suffering and pain, nor will he without luck survive for a long time. There is, however, another sort of capacity for long life which is separate from both strength and health; for many are long-lived without the virtues of body, but an exact account of these things is not at all useful for present purposes.[28]

28. *Long*. 5, *Juv*. 24 (18).

Having many friends and having good friends are quite clear when the definition of friend is given, that a friend is the sort of person who for the sake of the relevant other is inclined to do in action the things that he thinks to be good for that other. Someone, then, for whom there are many people of this sort has many friends, and if they are also decent people, he has good friends.

Good luck consists in the acquisition and possession of either all, most, or the most important of those goods of which luck is the cause. But luck is a cause of some things that craft is a cause of too, and of many things that fall outside the province of craft, such as those of which nature is the cause (although it is also possible for luck to be contrary to nature); for craft is a cause of health, while nature is a cause of noble beauty and stature. In general, the goods that result from luck are the sort that envy is about. But luck is also the cause of good things that are beyond account—for example, if the other brothers are ugly, but one is beautiful; or when the others do not see the treasure, but one person finds it; or when the arrow hits a bystander, not the one aimed at; or if one who frequently visits a certain place was the only one who did not go, while those who were going for the first and only time were killed; for all such things seem to be cases of good luck.

As to virtue, since it most properly belongs with the topic of praises, it must be defined when we give an account of praise.[29]

1.6
Deliberative Oratory (3)

It is evident what things should be aimed at, as future ones or already existing, in exhortation and what in dissuasion; for they are contraries. And since the advantageous is set before the deliberative speaker as the target (for people deliberate not about the end but about the things that further the end, and these are the advantageous ones as regards actions), and the advantageous is a good, the elements of good and advantageous must be grasped in a simple way.

Let good, then, be whatever is choiceworthy for its own sake; or that for whose sake we choose something else; or what all things aim at, or all that have perception or understanding, or would aim at if they got understanding. And whatever understanding would assign to each, and what in particular cases it does assign to each, this for each is a good; also that due to whose presence something is well situated and self-sufficient; and self-sufficiency [itself]; and what is productive or preservative of these things; and what they follow along with; and what is preventative and destructive of their contraries. But things follow along in two ways: either simultaneously or subsequently. For example, while scientific knowing is subsequent to learning, living is simultaneous with being healthy. And things are productive in three ways: some

29. 1.9.

in the way that being healthy is of health; some as nourishment is of health; some as athletic training is, because it for the most part produces health.

With these things laid down, it necessarily follows that the acquisition of good things and the deliverance from bad ones are both good; for in the latter case not having the bad follows along simultaneously [with the deliverance from it], and in the former having the good does so subsequently [to the acquisition of it]. And the acquisition of a greater good than a lesser one, and of a lesser bad one than a greater, are both goods; for to the extent that the greater exceeds the less, to this extent there **1362**^{b}**1** is an acquisition of the one and deliverance from the other. Also, the virtues are necessarily a good; for those who possess them are well situated with regard to them, and virtues are both productive of good things and able to do them in action (we must speak separately[30] about what, and what sort of thing, each of them is). And pleasure is a good; for all animals by nature aim at it. So both pleasant things and noble ones are necessarily goods; for the former are productive of pleasure, while of the noble ones, some are pleasant, others intrinsically choiceworthy.

Speaking of them one by one, the following things are necessarily good: Happiness; for it is both intrinsically choiceworthy and self-sufficient and we choose [all] the other things for the sake of it. Justice, courage, temperance, greatness of soul, magnificence, and the other such states; for they are virtues of soul. Also health, noble beauty, and the like; for they are virtues of body, and productive of many [good] things—for example, health of pleasure and living, which is why it seems best, in that it is the cause of the two things most honored by most people: pleasure and living. Wealth; for it is the virtue of possession and productive of many [good] things. A friend and friendship; for a friend is intrinsically choiceworthy, and productive of many [good] things. Honor, reputation; for they too are pleasant and productive of many [good] things, and for the most part the actual possession of the things for which people are honored follows along with them. The capacity to speak and to do things in action; for all such things are productive of goods. Further, a good natural disposition, memory, ease at learning, acumen, and all such things; for these capacities are productive of goods. Likewise, all the sciences and the crafts. Also living; for even if no other good should follow, it is intrinsically choiceworthy. And justice; for it is something advantageous to a community.

These, then, are pretty much the agreed-upon goods. And in the case of the disputed ones, deductions are drawn from the following: That whose contrary is bad is good. Also, that whose contrary is advantageous to the enemies—for example, if to be cowardly is especially advantageous to their enemies, it is clear that courage is especially beneficial to the citizens. And, in general, the contrary of what enemies wish for or enjoy appears beneficial. That is why it is said: "Now might Priam rejoice."[31] But this is not always so, though it is so for the most part; for nothing prevents the same

30. 1.9.
31. Homer, *Iliad* 1.255.

thing from sometimes being advantageous to both sides. Which is why it is said that
1363ᵃ1 evils bring people together when the same thing is harmful to both.

And what is not in excess is good, and whatever is greater than it should be, bad. Also, that for whose sake much labor has been spent and many expenses incurred is good; for it is already an apparent good, and such a thing is taken to be an end, and an end of many endeavors, and the end is a good. Which is why it is said: "They would leave to Priam to glory over . . . ," and "It is disgraceful to wait long. . . ."[32] Also the proverb about the pitcher at the door.[33] And what many people aim at, and what is manifestly fought over; for the good, we saw, is what all aim at, and many seems like all. Also what is praised; for no one praises what is not good. And what enemies, especially the base ones,[34] praise is good; for just like everyone they already agree that it is, if even those who are badly affected [praise it];[35] for it is because of its being quite evident that they would agree to it, just as they would that those people are base whom their friends blame and their enemies do not blame. That is why the Corinthians took it that they had been abused by Simonides when he wrote the verse: "Ilium does not blame the Corinthians."[36] Also, what one of the practically wise or one of the good men or good women has preferred, as Athena preferred Odysseus[37] and Theseus Helen,[38] and as the goddesses preferred Paris[39] and Homer Achilles.[40]

And, in general, the things that are deliberately chosen are good. And people deliberately choose to do the things that were mentioned, as well as those that are bad for their enemies and those that are good for their friends, that is, those that are possible. But the latter are twofold: things that might be brought about and things that are easily brought about. And the easy ones are those doable without pain or in a short time; for difficulty is defined either in terms of pain or of length of time.

Also, anything that comes about as people wish—and they wish either for nothing bad or less bad than good (and this will be the case if the cost[41] is unnoticed or slight). And things that are special to someone, or that no one else wishes to do, or that are extraordinary; for that way the honor is greater. And things that are fitting for them, and whatever in respect of their family or capacity is fitting for them is like this. Also, the things they think they are lacking in, even if small; for nonetheless they deliberately choose to do [what will get] them. And things that are easy to

32. Homer, *Iliad* 2.160, 298.
33. Having carried it from the well, don't break it at the door.

40. Homer, *Iliad* throughout.
41. Reading ἐὰν ἡ τιμωρία.

do; for being easy they are also possible (and the ones easily done are the ones that everyone, ordinary people, or people like or inferior to themselves have successfully accomplished). Also, things that will please their friends or annoy their enemies. And whatever those they admire deliberately choose to do in action. Also, what they are naturally well-disposed toward and experienced in; for they think they will easily succeed in accomplishing them. And the things no base person does; for these are more praiseworthy. Also, whatever they happen to have an appetite for; for it appears not only pleasant but also better. And above all for each group that with reference to which he is a lover of such things—for example, lovers of victory if it will be victory, lovers of honor if honor, lovers of wealth if wealth, and the others likewise. **1363^{b}1**

As regards the good and the advantageous, then, it is on these that we should base our means of persuasion.

1.7[42]
Deliberative Oratory (4)

Since people often agree that both of two things are advantageous but dispute about which one is more so, something must next be said about the greater good and the more advantageous.

Let exceeding, then, be being as great as plus something further, and let being exceeded be being contained; let greater and more always be what is so in relation to less, while great, small, much, and little are what are so in relation to the size of most things (with great being what exceeds it, while what falls short is small), and much and little likewise.

Since, then, we call "good" what is itself choiceworthy for its own sake and not for the sake of something else, and what all things aim at, and what something with understanding and practical wisdom would choose, and what is productive and protective of or follows along with these, and since the end is the for-the-sake-of-which, and what the other things are for the sake of is an end,[43] and since to an individual himself a good is what has received these affections in relation to himself, it necessarily follows that more is a greater good than one or fewer, provided that the one or the few are counted within it; for it exceeds and what is contained is exceeded. And if what is greatest [in one form] exceeds what is greatest [in another], the one [form] exceeds the other; and when the one [form] exceeds the other, the greatest in one exceeds the greatest in the other. For example, if the greatest man is greater than the greatest woman, in general, men are greater than women too; and if, in general, men are greater than women, the greatest man is also greater than the greatest woman; for the excess of the forms is proportional to that of the greatest in them.

42. Cf. *Top*. 3.1–5.
43. Reading τὸ δ᾽οὗ ἕνεκα τὸ τέλος ἐστί. τέλος δ᾽ἐστὶν οὗ ἕνεκα τὰ ἄλλα.

And whenever this would follow that, but that would not follow this (and it follows either simultaneously, subsequently, or potentially), [then that is greater than this;] for the use of the latter is already contained in the former. Living follows being healthy, but not vice versa, and does so simultaneously; scientific knowing follows learning and does so subsequently; and stealing follows violating a holy place and does so potentially; for someone violating a holy place might also steal from it.

And when two things exceed the same thing, the one that exceeds it more is a greater good; for it necessarily also exceeds the lesser of the greater [pair]. And things that are productive of greater goods are greater ones; for this, we saw,[44] is what it is to be greater by way of being productive of the greater. Likewise, the good whose producer is greater; for if being healthy is more choiceworthy than being pleased and a greater good, then health is also a greater good than pleasure.

Also, what is intrinsically choiceworthy is a greater good than what is not intrinsically so, as, for example, strength than what is health-giving; for the latter is not so for its own sake, while the former is so for its own sake—which, as we saw,[45] is precisely what the good is. And what is an end is a greater good than what is not an end; for the latter is choiceworthy for the sake of something else, the former for its own sake—for example, athletic training for the sake of having a body in good condition. Also, what has less need of a second thing or[46] of other things is a greater good; for it is more self-sufficient (and to have less need is to need fewer things or things easier to get). And when this cannot exist or come to be without that, while the latter can exist or come to be without the former[, the latter is a greater good]; what does not have the need is more self-sufficient, then, so that it appears to be a greater good.

Also, if something is a starting-point and the other not a starting-point, it is a greater good, or—due to the same consideration—if the one is a cause and the other not a cause; for without a cause and a starting-point being or coming to be is impossible. And if there are two starting-points, what comes from the greater starting-point is greater; and if there are two causes, what comes from the greater cause is greater. And the reverse, of two starting-points, the starting-point of the greater is greater, and of two causes, the cause of the greater is greater. It is clear, then, from what has been said, that a thing appears greater in two ways; for in fact if one thing is a starting-point and the other is not a starting-point, the former seems to be greater, and likewise if one is not a starting-point, but the other is[, the former seems to be greater]; for the end is greater and not a starting-point. Thus Leodamas said, when accusing Callistratus, that the one who gave the advice did a greater injustice than the one who did the action; for the action would not have been done had the other not given the advice. On the other hand, when accusing Chabrias, he also said the reverse, that the one who did the action did a greater injustice than the one who had

44. 1363ᵇ15.
45. 1363ᵇ12–14.
46. Reading ἢ.

given the advice; for it would not have occurred if there had not been the doer of the action; for this is what plotting is for the sake of, for people to act on it.

Also, what is rarer is a greater good than what is abundant, as gold is than iron, though less useful; for acquisition of it is a greater thing due to its being more difficult. In another way, the abundant is a greater good than the rare, because use is superior [to non-use]; for often is superior to seldom. Which is why it is said: "Water is best."[47] And, in general, the more difficult is a greater good than the easier; for it is rarer. In another way, the easier is a greater good than the more difficult; for it is how we wish it to be.

Also, that whose contrary is greater is itself greater, and that whose privation is greater. And virtue is greater than non-virtue and vice than non-vice; for the one is an end and the other is not an end. Also, those things of which the works are nobler or more shameful are themselves greater. And of those things whose virtues and vices are greater, the works are also greater, if indeed as the starting-points and causes are, so too are the consequences. And as the consequences are, so too are their causes and starting-points. Also, those things whose superiority is more choiceworthy or nobler. {For example, seeing with exactness is more choiceworthy than smelling with exactness; for sight is also more choiceworthy than smell; and to love companions is far more noble than to love wealth, so that love of companions is also nobler than love of wealth.}[48] Conversely, the better things are, the better their superiority is, and the more noble they are, the more noble it is. So too the objects of nobler and better appetites; for greater desires are for greater things. Also, due to the same considerations, appetites for nobler or better things are nobler or better.

1364^{b}1

And things of which the sciences are nobler or more excellent are nobler or more excellent things; for as the science stands so too does the reality; for each prescribes in its own area of it. And the sciences of more excellent and nobler things are proportional, due to the same consideration. And what the practically wise—either all, many, most, or the most excellent—would judge or have judged to be the good or the greatest good[49] must be such, either unconditionally or insofar as they made their judgment in accord with practical wisdom. This applies in common to other matters too; for something also is what it is, is a quantity, or is a quality, in the way in which scientific knowledge and practical wisdom would affirm it to be. We have said this in the case of goods; for we defined[50] that to be good which each and every thing, if it had acquired practical wisdom, would choose. It is also clear, then, that a greater good is one that practical wisdom more [firmly] asserts to be one. Also, what belongs to better people, either unconditionally or insofar as they are better [is a better good], as courage is better than strength. Also, what a better person would choose, either

47. Pindar, *Olympian* 1.1.
48. Probably out of place.
49. Reading ἀγαθὸν ἢ μεῖζον.
50. 1363^{b}12–15.

unconditionally or insofar as he is better, such as to suffer injustice rather than to do injustice; for this is what the more just person would choose.

Also, the more pleasant than the less pleasant; for all pursue pleasure, and desire to be pleased for its own sake, and it is in terms of this[51] that the good and the end were defined.[52] And something pleasant that is more free from pain and longer lasting is more pleasant. Also, the more noble than the less noble; for the noble is either the pleasant or the intrinsically choiceworthy. And things people wish to be more of a cause of, either to themselves or to their friends, are greater goods, and what they wish to be least of all a cause of, greater evils. Also, things that last a longer time rather than those that last a shorter time, and more secure ones than less secure ones; for the use of things that last a longer time is superior in regard to time and the use of things that are more secure is superior in regard to wish; for the secure one is readier for use whenever people wish.

Also, just as certain things would follow along from[53] co-ordinates[54] and similar inflections, so there are other things that follow along as well—for example, if what is done courageously is nobler than and more choiceworthy than what is done temperately, courage is more choiceworthy than temperance, and being courageous than being temperate.

And what is chosen by all is better than what is not chosen by all, and what more choose than fewer; for good, we saw,[55] is what all aim at, so that a greater one is what they aim at more. And what opponents or enemies [so choose], or judges, or those whom judges judge [to be competent]; for in the former two cases it would be as if all people would say so, and in the latter two as if those in control or those who know would. And sometimes what all share in is greater; for it would be a dishonor not to share in it. But sometimes it is what no one else or a few share in; for it is rarer.

Also, things that are more praiseworthy; for they are nobler. And things for which the honors are greater, in a similar way; for an honor is like a sort of estimate of worth. Also, things for which the punishments are greater. Also, things that are greater than those that are agreed to be or that are apparently greater. Also, the same things when divided into their parts appear to be greater; for there seems to be superiority in a greater number of things. Which is why the poet too says that Meleager was persuaded to rise up [by the thought of]

> All the sorrows that come to people whose city proper is taken:
> The people perish, and fire leaves the city in ashes,
> And strangers lead the children away.[56]

51. Reading αὑτοῦ.

53. Reading καὶ ὡς ἂν ἐκ.
54. *Top*. 2.9.
55. 1363b14.
56. Homer, *Iliad* 9.592–594.

Also, combination and building to a climax, as Epicharmus does, [is greater] both because this is the same as division (for combination shows great superiority) and because it makes something appear to be a starting-point and cause of great things.

And since the more difficult and rarer is greater, so opportune times, stages of life, places, the times, and capacities make things great; for if someone does something beyond his capacity, his stage of life, or what his equals do, and in such a way, or in circumstances, or at a time, the action will get great stature among actions that are noble, good, just, and their contraries. Hence the epigram on the Olympian victor:

> In the past, with a rough yoke on my shoulders,
> I used to carry fish from Argos to Tegea.[57]

And Iphicrates praised himself, saying: "Look what I started from."[58] Also, what is self-grown is greater than what is acquired; for it is more difficult—which is why the poet too says: "But I am self-taught."[59] Also, the greatest part of what is great is greater—for example, Pericles said in his funeral oration[60] that the young men were taken from the city: "As if the spring had been taken from the year." And things that are useful in greater need are greater—for example, those in old age or in illnesses. Also, of two goods, the one closer to the end. And the one for the individual himself than the unconditional one. And the possible one than the impossible one; for the former is good for the individual himself, while the latter is not.

And things included in the end life aims at; for the end is a greater good than what is close to the end. Also, things related to truth than things related to seeming. And the definition of what is related to seeming is what a person would not choose if he were going to escape notice. That is why for someone to have a good done to him seems to be more choiceworthy than to do a good; for a person will choose the former even if it escapes notice, but it seems that no one would do good were it to escape notice. Also, what someone wishes to be than what he wishes to seem; for the former is more related to truth. That is why people say that even justice is a small thing, because it seems to be more choiceworthy rather than being more choiceworthy. But this is not the case with being healthy.

Also, what is useful for more things—for example, for living and living well and pleasure and doing noble things. That is why wealth and health seem to be the greatest goods; for they possess all these qualities. And what is freer from pain and what involves pleasure; for these are more than one thing, so that pleasure is present as a good as well as painlessness. And of two goods, the one that when added to the same thing makes the whole greater is more choiceworthy. And things whose presence does

57. Attributed, with doubtful warrant, to Simonides.
58. $1367^{b}18$ quotes this in a fuller form.
59. Homer, *Odyssey* 22.347.
60. Probably the one given in Athens in 431 BC in honor of those killed in the first year of the Peloponnesian War. Also $1411^{a}2$–4.

not escape notice are greater than those whose presence does; for they tend toward the truth. That is why being wealthy would appear to be a greater good than seeming to be so. Also, what is beloved and what to some people is beloved alone while to others is possessed together with other things [would appear to be a greater good than what is not]. That is why the punishment is not the same if one blinds a one-eyed person as if one half blinds a person with two eyes; for in the first case one takes away what is beloved.

The things, then, on which the means of persuasion should be based in exhortation and dissuasion have pretty much been stated.

1.8
Deliberative Oratory (5)

The greatest and most controlling of all things as regards being capable of persuading and giving good advice is to get a grasp on all constitutions and to distinguish the characters,[61] customs, and advantages of each. For all people are persuaded by what is advantageous, and what preserves the constitution is advantageous. Further, the declaration of the controlling element is controlling, and the controlling elements differ in accord with the constitutions; for there are as many controlling elements as there are constitutions. And there are four constitutions: democracy, oligarchy, aristocracy, and monarchy, so that the controlling and deciding element would either be some part of these or the whole.

Democracy, then, is a constitution in which offices are distributed by lot; oligarchy one in which it is on the basis of a property assessment; and aristocracy one in which it is in accord with education. By "education" I mean that laid down by law; for in an aristocracy it is those who have remained true to the laws who rule. And they necessarily appear best (*aristos*), and it is from this that the constitution has taken its name. And monarchy, in accord with its name, is a constitution in which one person is in control of all. And of monarchies, the one that is in accord with some order is a kingship, while the indefinite one is a tyranny.

And the end aimed at by each constitution should not be overlooked [by the deliberative speaker;] for people choose what furthers the end. The end aimed at by democracy is freedom; by oligarchy, wealth; by aristocracy, things concerned with education and customs; and by tyranny, keeping guard. It is clear, then, that it is as things related to the end aimed at by each constitution that one should distinguish characters,[62] customs, and advantages, if indeed it is in relation to this that people make their choices. Since, then, means of persuasion come about not only through demonstrative argument but also through argument expressive of character (for we

61. Reading ἤθη.
62. Reading ἤθη.

are persuaded by a speaker due to his appearing to be of a certain quality, that is, if he appears good, goodwilled, or both), we should have at hand the characters belonging to each constitution; for the character belonging to each is necessarily most persuasive to each. And these characters will be grasped by means of the same things; for characters are made apparent in accord with deliberate choice, and deliberate choice is referred back to the end.

It has now been stated what things should be sought as future or present ones, while we are engaged in exhortation, and from what we should take their means of persuasion about the advantageous; further, through what and in what way we will be well equipped as regards the characters and the customs belonging to constitutions, so far as is suited to the present occasion; for an exact examination of these matters is given in the *Politics*.[63]

1.9
Epideictic Oratory

Next let us speak about virtue and vice, noble and shameful; for these are targets for the one who is praising and blaming. In speaking of these, we will at the same time in fact coincidentally make clear those things on the basis of which we will be taken to be people of a certain sort in accord with our character, which was just the second sort of means of persuasion; for it is on the basis of the same things that we will be capable of making both ourselves as well as someone else worthy of trust with regard to virtue. But since it happens that people, both in jest and in all seriousness, often praise not only a human being or a god but also inanimate things or a random animal, we must in the same way get hold of premises concerning these. So, to the extent necessary for the sake of having a paradigm, let us speak about these matters too.

The noble, then, is that which, being choiceworthy because of itself, is praiseworthy, or which, being good, is pleasant because it is good. And if this is what the noble is, it is necessary for virtue to be something noble; for it is praiseworthy because of being good. And virtue is a capacity, so it seems, capable of supplying goods and of preserving them, and a capacity productive of many and great benefactions—actually, of all of them in all cases. The parts of virtue are justice, courage, temperance, magnificence, greatness of soul, generosity, mild-manneredness, practical wisdom, and theoretical wisdom. But it is necessary for the greatest virtues to be those that are most useful to others, if indeed virtue is a capacity productive of benefaction. Because of this, people most honor the just and the courageous; for courage is useful to others in war, and justice is useful in peace as well. Next is generosity; for the generous spend freely and do not compete about money, which is what other people aim at most of all.

63. Especially 3.7–18, 4.2–16, 5.5–12.

Justice is the virtue due to which each has his own, and as law [prescribes], while injustice is that due to which he has what is another's, not as law prescribes. Courage is the one due to which people are capable of doing noble works in the midst of dangers, both as law prescribes and in submission to it; cowardice the contrary. Temperance is the virtue due to which people are disposed in the way that the law prescribes in relation to the pleasures of the body; intemperance the contrary. Generosity is the disposition to do good things in money matters; acquisitiveness the contrary. Greatness of soul is virtue productive of great benefactions; magnificence is virtue productive of greatness in matters of expenditure; the contraries are smallness of soul and niggardliness. Practical wisdom is virtue of thought in accord with which people are capable of deliberating well with a view to happiness about the goods and evils we mentioned.

About virtue and vice universally, then, and about their parts, enough has been said for the purposes of the present occasion, and the other things are not difficult to see; for it is clear that the things productive of virtue must be noble (for they further virtue), as must the things that are brought about by virtue, and both the signs and works of virtue are like this. But since the signs and such things as are the works done or things undergone that are characteristic of a good person are noble, it is necessary for whatever are the works of courage, signs of courage, or actions done courageously to be noble. Also just actions and works done justly (although not things justly undergone; for in the case of this virtue alone "justly" is not always noble, rather, in the case of being punished, to undergo it justly is more shameful than to do so unjustly). And with regard to the other virtues it is the same way.

Also, those things are noble for which the rewards are honor; and those for which the rewards are honor rather than money. Also, whatever choiceworthy things someone does not for his own sake. Also, unconditionally good things, and whatever someone has done for his country, disregarding his own interest. And things that are good by nature, and not [simply] good for himself; for the latter are the sort done for his own sake. And whatever can belong to a person when he is dead more than when he is alive; for what belongs to a person when he is alive has more the character of being for his own sake. And whatever works are for the sake of others; for they are less for the sake of himself. Also, whatever things are done well in relation to others but not in relation to oneself. And those works that relate to benefactors; for it is just to do them. Also benefactions; for they are not directed to oneself. Also, things that are the contraries of things that people are ashamed of; for they are ashamed of saying, doing, or intending to do shameful things, as when Alcaeus said: "I wish to say something, but shame prevents me." Sappho in fact replied:

> If you had a longing for the good and the noble,
> And if your tongue had not stirred up some bad thing to utter,
> Shame would not have filled your eyes,
> But you would speak about what is just.[64]

64. Fr. 137 Lobel & Page. Alcaeus' words are probably also part of the poem.

Also, those things are noble for which people compete without fear; for this is what one is feeling in relation to good things that conduce to reputation. And the virtues and actions of those who are by nature more excellent are more noble—for example, those of a man than those of a woman. Also, those for the indulgence of others rather than ourselves (that is why the just and justice are noble).

Also, to take revenge on enemies and not be reconciled; for to retaliate is just, and what is just is noble, and not to give way is characteristic of a courageous man. Also, victory and honor are among the noble things; for they are choiceworthy even if purposeless, and reveal a superiority of virtue. And things that are memorable, and the more so more. And the ones that follow a person when he is not alive and that honor follows,[65] the extraordinary ones, and the ones that belong to only one person are more noble; for they are easier to remember. As are possessions that are purposeless; for they are freer.

Also, the things special to each people are noble, and whatever are signs of the things praised among them—for example, in Sparta long hair is noble; for it is a sign of freedom; for it is not easy with long hair to do any work characteristic of a hired laborer. Also, not to work at any unrefined craft is noble; for it is characteristic of a free person not to live in dependence on others.

We should also take it that qualities that are closely allied to the actual ones are the same as them for the purposes of both praise and blame—for example, that a cautious person is cold and calculating, and that a silly one is kindly, and an unfeeling one calm. And [when praising] one should always take each of the qualities that follow along in the best sense (for example, one should take an irascible and enthusiastic person to be simple, and a surly one to be magnificent and dignified) and take those given to excess as [really] being in the virtuous condition (for example, a rash one as courageous, and a wasteful one as generous); for this will seem so to ordinary people, and at the same time is [a paradigm of] a fallacious argument proceeding from the cause; for if a person faces up to danger when it is not necessary, he will seem much more likely to do so wherever it is noble, and if he is lavish with random people, he will seem much more likely to be so with friends; for to do good for everyone is superiority of virtue.

One should also investigate whom the praise is in front of; for, as Socrates said,[66] it is not difficult to praise Athenians among Athenians. And one should speak of whatever is honored among each lot as actually present in [the one being praised]—for example, among Scythians, Spartans, or philosophers. And, in general, one should draw what is honored toward what is noble, since indeed they seem to be neighbors.

Also, all such things as are in accord with what is fitting are noble—for example, if they are worthy of someone's ancestors or his past achievements; for to acquire additional honor has the stamp of happiness and is noble. Also, something is noble if

65. Reading καὶ ἡ τιμὴ ἀκολουθεῖ.
66. Plato, *Menexenus* 235d. 1415^{b}30–33 repeats and expands.

it goes beyond what is fitting but toward the better and the nobler—for example, if someone is moderate in times of good luck, but great-souled in times of bad luck, or if, when he becomes greater, he is better and more open to reconciliation. Iphicrates' remark "Look what I started from to arrive here" is like this, as is that of the Olympic victor "in the past, with a rough yoke on my shoulders . . . ,"[67] and of Simonides "she whose father, husband, and brothers were tyrants."[68] Since praise is based on actions, however, and to act in accord with deliberate choice is a special characteristic of an excellent person, one should try to prove that the person [one is praising] is acting in accord with deliberate choice, and it is useful that it should appear that he has done so often. That is why one should take coincidences and things that happen by luck as due to deliberate choice. For if many similar cases are adduced, they will seem to be a sign of virtue and deliberate choice.

Praise is speech that makes the greatness of virtue apparent.[69] Hence one should prove that the person's actions have been of the requisite sort. An encomium, on the other hand, is concerned with works.[70] Circumstances, such as good breeding and education, contribute to persuasion; for it is likely that good people will come from good people and that people brought up in a certain way will be of the relevant sort. That is why we bestow encomia on those who have done some action.[71] And the works are signs of the state, since we would praise even someone who had not done any [similar] action, if we were persuaded that he was of the sort to do it. Blessing people and felicitating them are the same as each other, though not the same as praise and encomium, but rather just as happiness encompasses virtue, so felicitation encompasses these.[72]

Praise and speeches of advice belong to a common form, since the things one might propose in advising become encomia when their expression is changed. When, then, we have in hand what actions should be done and what sort of person someone should be, we ought to state these as proposals by changing and turning their expression. For example, "one ought not to think highly of what is due to luck but of what is due to oneself." When expressed in that way it is equivalent to a proposal, while as praise it is expressed this way: "He thinks highly not of what comes due to chance but due to oneself."[73] So, when you wish to praise, see what you would propose; and when you wish to make a proposal, see what you would praise. But the expression

67. 1365a26–27.

68. A fuller version of the story, without attribution, explains: "The dust covers Archedice daughter of Hippias, the best man in Greece of his time; though her father, husband, brothers, and sons were tyrants, her mind did not puff itself up with vanity" (Thucydides 5.59).

69. This paragraph and the next are repeated at 1416b29, where all editors mark a lacuna.

70. Reading τὸ δ' ἐγκώμιον τῶν ἔργων ἐστίν.

71. Reading διὸ καὶ ἐγκωμιάζομεν πράξαντας.

72. Reading μακαρισμὸς . . . περιέχει ταῦτα.

73. Isocrates, *Evagoras* 45.

will of necessity be the opposite when a preventative proposal and a non-preventative proposal are altered.

One should also use many means of amplification. For example, if the person is the only one, or the first one, or one of the few, or the one who has most of all done something; for all these are noble. Also, things based on times and opportunities—that is, if these go beyond what is fitting. Or if the person has often been successful in the same accomplishment; for that is a great thing and would seem to be not the result of luck but due to the person himself. Also, if incentives to achievement and awards of honor have been invented and established because of him. And if he was the first to whom an encomium was made, as in the case of Hippolochus,[74] and in that of Harmodius and Aristogeiton, for whom statues were set up in the marketplace. And likewise in the case of the contraries. And if one is not well equipped as regards the person himself, compare him with others, precisely as Isocrates used to do because of his familiarity with judicial oratory. Also, one should compare him to reputable people; for this is a means of amplification and noble, if he is better than the excellent ones.

Amplification quite reasonably falls within the means of praise; for it involves [showing a] superiority, and superiority is included among the noble things. That is why, even if not to the reputable ones, one should compare the person to ordinary people, if indeed the superiority does seem to indicate virtue. In general, among the forms of things common to all speeches, amplification is best suited to the epideictic ones (for these take up actions that are agreed upon, so that what remains is to bestow greatness and noble beauty on them); paradigms to deliberative ones (for we judge future things by divining them from past ones); and enthymemes to judicial ones (for what has happened, because of its lack of perspicuousness, is most of all receptive of a cause and a demonstration).

These, then, are the things on which speeches of praise and blame are pretty much all based, as well as the ones to look to when praising or blaming, and the things from which encomia and reproaches are produced; for if we have these in hand, their contraries are evident; for blame is based on the contraries.

1.10
Judicial Oratory (1)

We have to speak next about accusation and defense, and from how many and from what sorts of things deductions should be produced. One should, then, get hold of three things: first, what things and how many of them people do injustice for the sake of; second, in what way these people are disposed; third, the sorts of people they do **1368^{b}1**

74. Reading καὶ εἰς . . . οἷον εἰς Ἱππόλοχον.

injustice to and their condition. Let us discuss these in order after first defining what doing injustice is.

Let doing injustice, then, be doing harm voluntarily contrary to the law. And law is either special or common. By "special" I mean the written law by which people are governed; by "common" I mean whatever unwritten ones seem to be agreed to among all. And people do voluntarily whatever they do knowingly and without being compelled. But of the things they do voluntarily, not all are deliberately chosen, but those that are deliberately chosen are all done knowingly; for no one is ignorant of what he has deliberately chosen. Vice and lack of self-control are the things due to which people deliberately choose to do harm and do evil contrary to the law; for if certain people have one sort of depravity or more than one, it is with respect to the depravity they happen to have that they are also doers of injustice. For example, the ungenerous does injustice concerning money; the intemperate concerning the pleasures of the body; the soft concerning comfort; and the cowardly concerning dangers; for they abandon their comrades in danger because of fear.[75] The lover of honor does injustice, because of honor; the quick-spirited one, because of anger; the lover of victory, because of victory; the bitter person, because of revenge; the one who lacks practical wisdom, because of being mistaken about what is just and unjust; the shameless one, because of contempt for reputation; and likewise each of the others with respect to its underlying sort of depravity.

But this will be clear, partly from what we said about virtues, and partly from what we will say about feelings.[76] It remains to state what people do injustice for the sake of, in what way they are disposed, and to whom they do it.

First, then, let us go through what people desire and what sorts of things they are avoiding when they put their hand to doing injustice; for it is clear that the accuser must investigate the number and the sorts of things belonging to the opponent that all are aiming at when they do injustice to their neighbors; and the defendant, the number and sorts of these that do not belong.

All people, then, do all things either not due to themselves or due to themselves. Among the ones that are not due to themselves, they do some due to luck, others due to necessity, and of those due to necessity, some occur by force, some by nature. So all the things that people do that are not due to themselves are in some cases the result of luck, in some occur by nature, and in some by force. But whichever ones are due to themselves, and of which they themselves are the causes, are in some cases due to
1369a1 habit and in some due to desire, and of those due to desire some are due to rationally calculative desire and some to non-rational desire. In one case, then, there is wish, a desire for some good (for no one wishes for something except when he thinks it is a good), while anger and appetite are non-rational desires. Thus all the things that

75. Reading τοὺς γὰρ . . . τὸν φόβον.
76. 2.1–11.

people do they of necessity do due to seven causes: due to luck, nature, force, habit, rational calculation, spirit, or appetite.

To further divide these in accord with stage of life, state [of character], or other things related to action is superfluous; for if the young happen to be prone to anger or appetite, they do not do actions of this sort due to their youth, but due to anger and appetite. Nor is it due to wealth or poverty—rather, the poor happen to have an appetite for money due to their lack of it, while the rich happen to have an appetite for unnecessary pleasures due to their abundant resources. But these people too will do the actions they do, not due to wealth or poverty but due to appetite. Similarly, both the just and the unjust, and the others said to do the actions they do in accord with their states [of character], do them due to the same causes; for they do them either due to rational calculation or due to feeling, although some due to excellent characters and feelings, some due to the contrary ones. Of course, it is a fact that states of one sort are followed by one sort of action, and of another sort by another sort; for excellent beliefs and appetites concerned with pleasures follow immediately and in like manner for the temperate person due to his being temperate as the contrary ones do for the intemperate person concerning the same things. That is why, though these sorts of divisions must be put aside, we must investigate which sort usually follows which sort; for if someone is pale or dark, big or small, nothing is regulated so as to follow from such things, while if someone is young or old, just or unjust, it immediately makes a difference. And, in general, [we must investigate] whatever coincidental things make the characters of people different—for example, seeming to oneself to be rich or poor will make some difference, or to be lucky or unlucky. We will discuss these issues later on,[77] but now let us speak first about what remains.

The sorts of things that are the result of luck are the ones whose cause is indefinite, which do not occur for the sake of anything, or always, or for the most part, or in some orderly way (all this is clear from the definition of luck); those that are by nature are the ones whose cause is within themselves and is orderly; for they always or for the most part occur in the same way. As for those that occur contrary to nature, nothing need be argued in an exact way as to whether they are in accord with nature or due to some other cause; but luck would also seem to be a cause of such things. By force are whatever things come to be, contrary to their appetite or their rational calculation, through[78] the doers themselves. Things that occur by habit are whatever things people do due to having done them often. Things that occur due to rational calculation are the things that seem to be advantageous on the basis of the goods mentioned,[79] either as an end or as what furthers an end, whenever they are done for the sake of the advantage; for the intemperate also do advantageous things, not because of their being advantageous, but because of pleasure. Things that occur due to spirit or anger

77. 2.12–17.
78. Reading δι'.
79. 1.6.

are acts of revenge. (Revenge and punishment are different; for punishment is for the sake of the sufferer, revenge for the sake of the doer, in order that he get satisfaction. What anger is will become clear in the discussion of the feelings.[80]) What is due to appetite is whatever is done that appears pleasant. The customary and the habitual are included among the pleasant things; for people even do with pleasure many things that are not by nature pleasant when they have become habituated to them.

So, by way of summary, whatever things people do due to themselves are all either good or apparently good, pleasant or apparently pleasant. And since they do voluntarily whatever they do due to themselves, and not voluntarily whatever is not due to themselves, everything they do voluntarily would be either good or apparently good, pleasant or apparently pleasant; for I place the removal of evils and apparent evils, or the exchange of lesser for greater ones, among the good things; for they are, in a way, choiceworthy. And I likewise place among the pleasant ones, the removal of pains or apparent pains, and the exchange of a greater pain for a lesser. We must, therefore, get hold of advantageous things and pleasant ones, both how many they are and of what sorts.

We spoke previously[81] about the advantageous in the case of deliberative oratory; let us now speak about the pleasant. And we should consider our definitions as adequate in each case if they neither lack perspicuousness nor are [too] exact.

1.11
Judicial Oratory (2)

Let us assume, then, that pleasure is a sort of movement of the soul, an intensive and perceptible settling down into its original natural state, and pain the contrary. And if pleasure is something like this, it is also clear that pleasant is what is productive of
1370ᵃ1 the condition that was mentioned, and what is destructive of it or is productive of the contrary settling down is painful. Thus movement into the condition that is in accord with nature is necessarily pleasant for the most part, and especially whenever what comes about in accord with nature has recovered its own natural state.

Also, habits are pleasant; for the habitual has already become natural, as it were; for habit is something like nature; for in fact what occurs often is close to what occurs always, and nature belongs with always, habit with often. Also, what is not forced is pleasant; for force is contrary to nature—which is why what involves necessity is painful, and why it has been correctly said that "every necessary thing, indeed, has a troublesome nature."[82] Also, things that require supervision, effort, and exertion are painful; for these too involve necessity and are forced, unless people become habituated to them; then habit makes them pleasant. But their contraries are

80. 1378ᵃ31–33.
81. 1.6.
82. Evenus of Paros, F8 West.

pleasant—which is why comforts, exemptions from toil, exemptions from supervision, amusements, relaxations, and sleep are among the pleasant things; for none of these is against necessity.

{Also, everything for which we have an appetite within us is pleasant; for appetite is a desire for what is pleasant. Among appetites, some are non-rational, while others involve reason. By "non-rational ones" I mean those where people have an appetite not on the basis of taking something to be the case. Those that are by nature said to be of this sort, like those that are present in us through the body—for example, for nourishment, thirst and hunger,[83] and for a particular form of nourishment, a particular form of appetite; those connected with taste, sexual pleasures, and, in general, with objects of touch; and those of smell, hearing, and sight. Those that involve reason, on the other hand, are those which people have an appetite for on the basis of being persuaded; for there are many things that people have an appetite to look at or acquire after hearing about them and being persuaded.}[84]

Since being pleased consists in perceiving a certain feeling, and imagination is a sort of weak perception, and some sort of imagination of what he remembers or expects always[85] follows along in the person expecting or remembering, then, if all this is so, it is clear that pleasure too follows along simultaneously in those remembering and expecting, if indeed perception also does. So it is necessary that all pleasant things are either present (in the perceiving), or past (in the remembering), or future (in the expecting); for people perceive present things, remember past ones, and expect future ones. Hence memories are pleasant, not only about things that were pleasant in the present in which they took place, but sometimes even about some unpleasant things if their subsequent results were noble and good. Which is why too it has been said, "but pleasant it is when rescued to remember one's sufferings"[86] and "for afterward a man rejoices at his pains, when he remembers them, one who suffers much and much accomplishes."[87] The cause of this is that not having a bad thing is also pleasant. And those expected things are pleasant that appear to confer great delight or benefit when present, or to benefit without pain. In general, things that give delight when present are for the most part pleasant both when we expect them and when we remember them. That is why even being angry is pleasant, as Homer too said when he wrote about spirit that it "is much sweeter than dripping honey";[88] for no one is angry at someone on whom it is apparently impossible to take revenge, nor at those who are greater than themselves in capacity, [that is,] either they feel no anger or less anger.

Also, a sort of pleasure follows along with most appetites; for people enjoy a certain pleasure when they remember that they got something or anticipate that they

83. Reading δίψα καὶ πεῖνα.
84. Probably out of place.
85. Reading κἀεὶ ἐν.
86. Euripides, *Andromeda*. Fr. 131 Nauck.

88. Homer, *Iliad* 18.109. Quoted more fully at 1378^{b}5–7.

will get it. For example, those in a fever, during their attacks of thirst, enjoy both remembering having drunk and anticipating drinking. And lovers always enjoy discussing things, writing, and doing something concerning the beloved; for in all such things, by remembering, they think they perceive, as it were, their beloved; for the starting-point of love is the same for all: when they not only enjoy the beloved when he is present, but also enjoy remembering him when he is absent; and they are in love also when there is pain at his absence. So too in the same way there is a certain pleasure that attaches to mourning and lamentation for a departed one; for there is pain at his not being there and pleasure in remembering and, in a way, seeing him, the actions he was doing, and what he was like. That is why it made perfect sense to say, "Thus he spoke, and stirred in all of them the longing for weeping."[89]

Also, getting revenge is pleasant; for if something is such that not getting it is painful, getting it is pleasant, and angry people who do not get revenge are unsurpassably pained, while they enjoy anticipating it. And victory is pleasant, not only for those who love victory, but for all; for an appearance of superiority results, which all have an appetite for, whether mild or more intense. And since victory is pleasant, amusements must also be pleasant, both warlike ones and contentious arguments (for victory often occurs in these), as must games of knucklebone, ball, dice, and checkers. It is the same as regards more serious amusements; for some become pleasant when one is accustomed to them, while others are pleasant from the outset, such as tracking with dogs and every sort of hunting; for where there is a contest, there is victory too. That is why judicial oratory and contentious argument are pleasant to the habituated and capable.

And honor and good reputation are among the pleasantest things, because in each case an appearance results of having the qualities of an excellent person, and all the more when others that the person thinks to be truthful say so. (And of the latter sort are those close to him rather than the ones at a distance; the familiar ones and his fellow citizens rather than those from far away; his contemporaries rather than future people; practically wise people rather than those without practical wisdom; and many rather than few; for those mentioned are more likely to be truthful than their contraries.) Since one cares nothing about the honor or opinion of those one greatly despises, such as children or beasts, at any rate, not for the sake of one's reputation, but rather if indeed one does, it is because of something else.

Also, a friend is among the pleasant things; for loving is pleasant (for no one is a wine lover who does not enjoy wine) and so is being loved; for in being loved too there is an appearance that one is oneself the possessor of the goodness that all those who perceive [it] have an appetite for; since to be loved is to be liked because of oneself. And to be admired is pleasant because it is the same thing as being honored. And to be flattered and have a flatterer is pleasant; for a flatterer is an apparent admirer and an apparent friend.

89. Homer, *Iliad* 23.108, *Odyssey* 4.183.

Also, to do the same things often is pleasant; for, as we saw,[90] what one is accustomed to is pleasant. And [then] change is pleasant; for change is to one's natural state; for always doing the same thing produces an excess of the state settled down into. Hence the saying "In all things change is sweet."[91] Because of this, what comes at intervals is also pleasant, whether people or things; for there is change from what is present, and at the same time what comes at intervals is also rare.

Also, to learn and to wonder is for the most part pleasant; for in wondering there is an appetite for learning, so that what one wonders at one has an appetite for, and in learning there is a settling down into what is in accord with nature. And to do good and to have good done to one are pleasant things; for to have good done to one is to attain what you have an appetite for, and to do good implies both having and superiority, both of which people aim at. And because being productive of good is **1371b1** pleasant, so too it is pleasant for people to rectify their neighbors and make up for their deficiencies. And since to learn is pleasant and to wonder [at things], so too other things are necessarily pleasant—for example, what is imitative (like the crafts of painting, sculpture, and poetry) and everything that is well imitated, even if what is imitated is not pleasant; for it is not it that one enjoys, but there is a deduction that this is that, so that the result is that one learns something. Also, reversals[92] and narrow escapes from danger [are pleasant]; for all of these excite wonder. And since what is in accord with nature is pleasant, and those that are of the same kind are related to each other in accord with nature, all things that are of the same kind and alike are for the most part pleasant to each other—for example, human to human, horse to horse, and youth to youth. Hence the proverbs: "Peer delight peer," "Like to like," "Beast knows beast," "Birds of a feather flock together," and other such things.

But since all that is like oneself or the same in kind is pleasant to oneself, and each person feels this pleasure above all in relation to himself, necessarily all are more or less self-lovers; for all such things belong, in the highest degree, to his relation to himself. And since all are self-lovers, necessarily the things that are their own are also pleasant to them all—for example, their works and words. That is why people for the most part are lovers of flatterers, of lovers, of honors, and of children; for children are their own work. And to make up for deficiencies is pleasant; for then the thing becomes their own work. {And since to rule is most pleasant, seeming to be theoretically wise is also pleasant; for what exercises practical wisdom is fitted to rule, and theoretical wisdom is the scientific knowledge of many wondrous things.}[93] Further, since people are for the most part lovers of honor, it is necessary that it is pleasant to criticize one's neighbors, and to rule [in that way]. Also, to spend time at what one seems to oneself to be best in is pleasant, as the poet too says:

90. 1369b16–18.
91. Euripides, *Orestes* 234.
92. *Po.* 1452a22–24.
93. Probably out of place.

Toward this he presses hard,
To this each day allots the biggest part—
What he is indeed the best in.[94]

Similarly, since amusements are among the pleasant things, every sort of relaxation is too. And since laughter is among the pleasant things,[95] necessarily ridiculous things (whether people, words, or works) are as well. The ridiculous has been discussed separately in the *Poetics*.[96]

About pleasant things, then, let this much be said; those that are painful will be evident from the contraries of these.

1.12
Judicial Oratory (3)

These, then, are things for the sake of which people do injustice; let us now discuss the way in which they are disposed and whom they do injustice to.

People do injustice, then, whenever they think that it is possible to do the thing at issue and possible for them to do it—whether they think either that their action will escape notice, or that if it does not escape notice, it will not be given a trial, or that if it is given one, the penalty will be less than the profit to themselves or to those for whom they care. What sorts of things appear possible or impossible will be discussed later[97] (for they are common to all speeches).

Those who do injustice think that they can especially do so without penalty when they are capable speakers, [effective] doers of action, and experienced in many [political] debates, and if they have many friends, and if they are rich people. And they especially think they can do so if they themselves are among those mentioned; but if not, if they have friends, assistants, or partners like this; for due to these they can [effectively] do actions, escape notice, and not be punished. Also, if they are friends of those being treated unjustly or of the judges; for friends are not on guard against being treated unjustly and, besides, they attempt reconciliation before undertaking to prosecute; and judges favor those they are friends with, and either wholly acquit them or impose a small penalty.

The ones likely to escape notice are the ones who are the contraries of the accusations—for example, a weak person concerning assault, and a poor or ugly one concerning adultery. Also, those who do things very much in the open and in the public eye (for they are not guarded against; for no one at all would think them possible), or things that are so great or of such a sort that no one person [would

94. Euripides, *Antiope.* Fr. 183 Nauck.
95. Reading καὶ ὁ γέλως τῶν ἡδέων.
96. 1449ᵃ32–37, F167.
97. 1392ᵃ8–ᵇ14.

be thought capable of them]; for these things are not guarded against either; for all guard against the usual unjust actions, which is also the case with illnesses, but illnesses that no one at all has ever been ill with no one takes precautions against. Also, those who have either no enemies or many; for the former think they will escape notice because they are not being guarded against, while the latter escape notice because it does not seem that they would attempt to attack those on their guard, and because they have as their defense that they would not have attempted it. And those who have ways or places of concealment, or abundant opportunities for disposal [of stolen property].

Also, those who do not escape notice but can have the trial put aside or postponed for a long time, or corrupt the judges. And those who, if a penalty is imposed, can get full payment put aside or postponed for a long time. Or if, due to lack of means, the person has nothing to lose. Also, those for whom the profits are evident, large, or immediate, while the penalties are small, un-evident, or remote. {And the one for whom the retribution is not equal to the benefit, as seems to be the case with **1372b1** tyranny.}[98] Also, those for whom the unjust actions bring solid gains, while the only penalties are mere reproaches; and, contrariwise, those whose unjust actions tend to involve some praise, for example, if the person happened at the same time to have taken revenge for a father or mother, as in the case of Zeno,[99] while the penalties tend to involve fines, exile, or something of that sort; for people do injustice for either reason and in either condition [of mind], yet they are not the same, but rather contrary, in character.

Also, those who have often escaped notice or gone unpunished; and those who have often been unsuccessful; for there are even some in cases like these, as, among the warlike, who are ready to renew the fight. And those for whom the pleasure is immediate, while the pain is later, or where the profit is immediate, while the penalty is later (for those who lack self-control are like that, and lack of self-control is concerned with everything they desire); and, contrariwise, those for whom the pain or the penalty is immediate, while the pleasure and benefit are later and more lasting (for those who are self-controlled and those who are more practically wise pursue such things).

Also, those who may possibly seem to have acted due to luck, necessity, nature, or habit, and, in general, to have committed an error but not an injustice. And those for whom there is a chance of decent consideration. And those in need; but one is in need in two ways: for need is either a matter of necessity, as in the case of the poor, or of excess, as in the case of the rich. Also, those who are very reputable, and those who are very disreputable—the former because they are not suspected, the latter because they will not be any more suspected than before.

98. Probably out of place.
99. Reference uncertain.

When disposed in these ways, then, people attempt to do injustice, and they do injustice to people of the following sorts and regarding things of the following sorts: Those who have something they need, either as necessities, or as excess, or for indulgence, whether they are far away or close by; for in the latter case the getting is fast, and in the former the retribution is slow, as if the [Greeks] were to plunder the Carthaginians. Also, those who are not cautious nor on their guard, but trusting; for it is easy to take all these unawares. And those who are careless; for prosecuting is characteristic of a careful person. Also, those who are prone to shame; for they are not likely to fight over profits. And those that have been treated unjustly by many but have not prosecuted them; for these are, as the proverb goes, "Mysian spoil."[100] Also, those who have never, and those who have often, been so treated; for both are off their guard—the former, because it has never happened, the latter because it surely would not happen again. And those who have been accused or it is easy to accuse; for such people, as hated and resented, neither deliberately choose [to prosecute], for fear of the judges, nor are capable of persuading them. And those against whom they have the pretext that their ancestors, they themselves, or their friends treated badly, or were going to treat badly, either the doers of the injustice themselves, their ancestors, or those for whom they care; for as the proverb says, "A pretext is the only thing wickedness needs." Also, their enemies and their friends; for the latter is easy, and the former pleasant. And those who are friendless, or not clever either in speaking or in action; for they either do not attempt to prosecute, or seek reconciliation, or accomplish nothing. And those for whom there is nothing to gain from spending time keeping an eye on the trial or the full payment of the fine, for example, foreigners and the self-employed; for they resolve the case for a small sum and readily cease the proceedings. Also, those who have done many unjust actions, or of the same sorts as are being done to them; for it almost seems not to be an injustice when someone is done an injustice of the same sort as the injustice he is accustomed to do to others. I mean, for example, if someone treats a person in an insulting way who is accustomed to committing wanton aggression. Also, those who have done evils to them, or wished, wish, or are about to do them; for it includes something both pleasant and noble and appears close to not doing an injustice. And those by doing injustice to whom they gratify friends, those they admire or love, those in control, or, in general, those they live in dependence upon. And those with regard to whom there is a chance of decent consideration. And those against whom they have made complaints and had previous differences, as Callippus did in the Dion affair; for even things like that appear close to not doing an injustice. And those to whom others are going to do injustice, if they themselves do not do so first, on the supposition that it is no longer possible to deliberate, as Aenesidemus is said to have sent the prize in a game of *kottabos* to Gelon after the latter had enslaved the city, because he had done first what Aenesidemus himself was going to do. Also, those whom, after doing them

100. Easy prey. The source of the proverb is unclear.

the injustice, they can do many just things for, on the supposition that they will thus easily repair it, as Jason the Thessalian said that he had to do some unjust things in order to be capable of also doing many just ones.

Also, [people do injustice regarding] things of the sort that all or many are accustomed to do; for they think they will get sympathetic consideration. And regarding things easy to hide, and of the sort that are quickly consumed, such as the edible ones. Or those that are easy to change in color, shape, or by mixing, or those that it is easy to conceal in many places. Such things include those that can be easily carried or concealed in small places, and those that are indistinguishable from or similar to many that the doer of the injustice already had. Also, things that those treated unjustly are ashamed to mention—for example, acts of wanton aggression against the women of their household, or against themselves or their sons. And those the prosecutor of which would seem litigious, and those that are small or which merit sympathetic consideration are like this.

The ways, then, in which those who do injustice are disposed, what sorts of unjust actions they do and to what sorts of people, and due to what, are pretty much these.

1.13
Judicial Oratory (4)

Let us now determine all the unjust actions and all the just actions, starting first with the following points. The just actions and the unjust actions, then, have been defined in relation to two sorts of laws and in two ways in relation to persons. I mean that law is on the one hand special and on the other hand common, the latter being unwritten, the former written, and special being what each [community] has defined relative to itself, and common what is in accord with nature. For there is what all people, even if they do not share any community whatever with each other or any contracts, divine that there is: a common justice and injustice that is by nature. For example, this is what Antigone in Sophocles' play is manifestly speaking about when she says that it is just, though forbidden, to bury Polyneices, since this is just by nature: **1373b1**

> For not just now or yesterday, but always, ever
> Lives this [law], and no one knows whence it appeared.[101]

And, as Empedocles says about not killing an animate thing; for this is not just for some and unjust for others:

> What is lawful for all extends continuously
> Through the wide-ruling ether and through the immense light of the sun.[102]

101. *Antigone* 456–457.
102. B135 DK.

And as Alcidamas says in the *Messianicus*, ["god has made all people free; nature has made none a slave"].[103]

And in relation to persons, law is divided in two ways, for what one should do or not do is defined in relation to the community or in relation to an individual member of the community. That is why unjust actions and just actions are a matter of doing injustice and acting justly in two ways, either in relation to a single and definite individual or in relation to the community; for to commit adultery or to strike a blow is to do injustice to some definite individual, while refusing to serve in the army is to do injustice to the community.

With this division, then, of all the unjust actions, some being in relation to the community, others in relation to one person or in relation to several persons, let us take the matter up again and state what it is to be treated unjustly. To be treated unjustly, then, is to suffer unjust actions at the hands of someone who does them voluntarily; for doing injustice was previously defined[104] to be voluntary. And since the one treated unjustly must be harmed, and harmed involuntarily, such harmful actions are evident from our previous discussion (for intrinsic goods and evils have been discussed previously, as have things that are done voluntarily, that they are the ones done knowingly), so that all accusations must be either in relation to the community or in relation to the private individual, the accused having acted either ignorantly and involuntarily or voluntarily and knowingly, and in the latter case some from deliberate choice and others due to feeling. Spirit will be spoken about[105] in the account of the feelings; and what sorts of things people deliberately choose and the way they are disposed were spoken about earlier.[106]

But since people often agree that they have done the action but do not agree with the indictment or what the indictment is about—for example, to have taken something, but not to have stolen it; to have struck the first blow, but not to have committed wanton aggression; to have had sexual relations, but not to have committed adultery; to have stolen something, but not to have committed sacrilege (for it did not belong to a god); to have trespassed, but not on public land; or to have had discussion with enemies, but not to have committed treason. Because of this, definitions should be given of these things: what theft is, what wanton aggression is, and what adultery is. That way if we wish to prove that an offense has or has not been committed, we will be able to make evident what is just. And in all such cases the dispute is about whether the accused is unjust and base or not unjust; for depravity and injustice lie in the deliberate choice, and all such names—for example, wanton aggression and theft—signify deliberate choice in addition [to the action]; for if someone has struck another a blow, he has not in all cases committed wanton aggression against him, but rather if he has done so for the sake of something—for

103. The missing text is supplied from a scholiast.
104. 1368b6–7.
105. 2.2.
106. 1368b28–1369a7, 1.11–12.

example, to dishonor the other or to please himself. Nor in all cases, if he took something by stealth, has he stolen it, but rather if he took it for the purpose of harm and for his own use and advantage. It is the same with the others as it is with these.

But since, as we saw,[107] there are two forms of just and unjust actions (for some are written, others unwritten), and the ones the laws proclaim have been spoken about, two forms of [such actions as determined by] unwritten laws remain. On the one hand, these are the ones that are in accord with a superiority of virtue or vice, for which there are reproaches and praises, dishonors and honors, and rewards—for example, being grateful, or doing good in return for good, to a benefactor, helping one's friends, and other such things. On the other hand, they are the ones omitted by the special written law. For decency seems to be something just, and decency is justice that lies beyond the written law. These omissions are sometimes voluntary on the part of legislators and sometimes involuntary. They are involuntary whenever something escapes their notice, voluntary whenever they cannot define something [exactly], but, on the one hand, it is necessary to speak in universal terms, and, on the other, the definition does not hold universally, but rather for the most part. Also, wherever it is not easy to give a definition due to the unlimitedness [of the possibilities], for example, the size and sort of iron implement to be used in a case of wounding; for a lifetime would not suffice to enumerate them completely. If the action, then, is something that cannot be [exactly] defined, but a law must be established, it is necessary to speak unconditionally, so that if someone wearing a ring raises his hand or strikes a blow, according to the written law he will be liable and have done injustice, while in truth he has not done injustice; and this is decency. **1374^{b}1**

If, then, decency is what was stated, it is evident what sorts of things are decent and what sorts not decent, and what sorts of people are not decent; for cases in which there should be sympathetic consideration are cases for decency, and it consists in not judging errors and unjust actions as deserving of the same [penalty], or strokes of bad luck either. Strokes of bad luck are whichever ones are contrary to reasonable expectation and do not result from depravity; errors are whichever ones are not contrary to reasonable expectation and do not result from depravity; and unjust actions are whichever ones are not contrary to reasonable expectation and do result from depravity. Also, to make allowances for human weaknesses is decent. As is looking not to the law but to the legislator; not to the word but to the thought of the legislator; not to the action but to the deliberate choice; not to the part but to the whole; and not to what sort the person is now but to what sort he has been always or for the most part. Also, to remember good things received rather than bad ones, and good things received rather than good ones done. And to show restraint when one is treated unjustly. And to be willing to be judged by word rather than by work. And to wish to go into arbitration rather than to trial; for the arbitrator looks to what is decent,

107. E.g., 1373^{b}2–6.

while the judge looks to the law. Indeed, it was for the sake of this that arbitrators were invented, that decency prevail.

As regards decent things, then, let them be determined in this way.

1.14
Judicial Oratory (5)

An unjust action is greater insofar as it results from a greater [state of] injustice; that is why the least one may be the greatest—for example, the accusation of Callistratus against Melanopus, that he defrauded the officials in charge of temple upkeep of three consecrated half-obols. But in the case of justice it is the contrary. This[, that the least may be the greatest,] is so because the greatest is potentially present in the least; for the one who has stolen three consecrated half-obols would do any injustice whatever. Sometimes, then, the greater is judged in this way, sometimes from the harm [done].

Also, [an unjust action is greater] where there is no equal penalty but all are too little. And where there is no remedy; for it is difficult, indeed impossible [to find a remedy]. And if the sufferer of the injustice cannot get a trial; for then the injustice is not remediable; for a trial and a punishment is a remedy. And if the sufferer, that is, the person who has been treated unjustly, inflicted some great punishment on himself; for then the doer of the injustice would justly be punished with a yet greater one—for example, Sophocles, when pleading on behalf of Euctemon, who had cut his own throat after the wanton aggression he had suffered, declared that he would not assess the penalty at less than the sufferer had assessed for himself.

Also, when someone is the only, the first, or among the few, to have done it. And to commit the same error often is a great thing.[108] Also, when due to it preventions and penalties have been sought and discovered—for example, in Argos a person is penalized due to whom a law was set up, as are those due to whom a prison was built.[109] And an unjust action is greater, the more beast-like it is. Also, the more premeditated it is. And what those who hear about it fear more than pity. (And the rhetorically relevant facts are of the following sort: that the person has abrogated or exceeded many [parts of] justice—for example, oaths, handshakes, promises, marriage agreements; for this is an excess consisting of many unjust actions.)

Also, those that occur in a place where doers of injustice are being punished—which is precisely what perjurers do; for where would they not do injustice, if they do it even in court? And things in which there is the most shame. And if done to someone who has done good to him; for he does more injustice, in that he does bad and also in that he does not do good. And the person who contravenes the unwritten

108. Reading μέγα.

109. Nothing is known about these events.

parts of justice [is more unjust]; for it is characteristic of a better person to be just without being compelled, and the written parts compel, while the unwritten ones do not. But he is so, in another way, if he contravenes the written ones; for the unjust person who does unjust actions that involve fears and punishments would also do them were they punishment-free.

About greater and lesser unjust action, then, let this much be said.

1.15
Judicial Oratory (6)

Following what has been said we have now to run through the means of persuasion that are called "outside the province of craft"; for they are special to judicial speeches. They are five in number: laws, witnesses, contracts, [results of] torture, and oaths.

First, then, let us speak about laws, and in what way they should be used in exhorting and dissuading and accusing and defending. For it is evident that if the written law is contrary to the thing at issue, one should use common law and what is decent as being more just. And [one should say] that "the best consideration"[110] requires this: not to use the written law point by point. And that the decent always remains and never changes, and neither does the common law (for it is in accord with nature), while the written ones often do. Hence what is said in Sophocles' *Antigone*; for Antigone defends herself for having buried Polyneices contrary to the law of Creon, but not contrary to the unwritten one, by saying,

> For not just now or yesterday, but always, ever **1375b1**
> . . .
> This I was not likely [to break] because of any man.[111]

And that the just is something true and advantageous, but what [only] seems to be so is not, so that neither is the written law; for it does not always do the work of law. And that the judge is like the assayer of silver, because he distinguishes counterfeit justice from true justice. And that it is characteristic of a better man to use and abide by the unwritten laws rather than the written ones.

Also [one should look to see] whether the [written] law is in some degree contrary to popular law, or if it is even contrary to itself; for sometimes one law prescribes that contracts be binding, while another forbids making contracts contrary to the law. And if it is ambiguous, so that one can turn it about and see which construal will fit either what is just or what is advantageous, then this is the construal to use. And if

110. Athenian judges swore an oath whose gist seems to have been something like this: "I will cast my vote according to the laws and using my most just consideration."
111. Sophocles, *Antigone* 456, 458; 1373b12 quotes ln. 457.

the circumstances that led to setting up the law no longer remain in place but the law does, one should try to make this clear, and fight against the law by means of it.

If, on the other hand, the written law looks to the thing at issue, one should say that [the oath requiring] "the best consideration" is not there for the sake of judging contrary to the law, but in order that, if the judge is ignorant of what the law says, he does not violate his oath. Also, that no one chooses what is unconditionally good, but what is good for himself. And that there is no difference between a law's not being laid down and its not being used. And that in the other crafts there is no profit in being "wiser than the doctor"; for an error on the part of a doctor does not do so much harm as getting in the habit of disobeying the ruler. And that to seek to be wiser than the laws is the very thing that is forbidden in the laws that are praised. As regards the laws, let things be determined in this way.

As for witnesses, witnesses are of two sorts: the ancient ones and the recent ones. And of the latter, some share in the risk, while others are outside it. By "ancient" I mean the poets and other notable people whose judgments are available—for example, the Athenians used Homer as a witness concerning Salamis,[112] and the Tenedians recently used Periander of Corinth against the Sigeans.[113] And Cleophon used the elegies of Solon against Critias, saying that the loose living of his family was ancient; for otherwise Solon would never have written, "Tell the fair-haired Critias from me to listen to his father."[114] Such witnesses, then, are concerned with past events, while interpreters of oracles are concerned with future ones. For example, Themistocles said that "the wooden wall" meant that a naval battle must be fought. Further, proverbs, as has been said,[115] are witnesses. For example, if someone advises against making a friend of an old person, the proverb "never do good to an old person" testifies to this. And if he advises doing away with children after having done away with the fathers, "foolish is he who having killed the father leaves behind the sons."[116]

Recent witnesses are notable people who have given a judgment about something (for their judgments are indeed useful to those disputing about the same things)—for example, Eubulus, when attacking Chares in court, made use of what Plato said against Archibius, that "confessions of wickedness have increased in the city."[117] Also, those who share in the risk, if they seem perjurious. Such people are witnesses only as to whether something has happened or not, or is or is not the case; they are not witnesses as to the quality of the action—for example, whether it was just or unjust,

112. In the struggle between Athens and Megara for possession of Salamis, Solon allegedly cited Homer, *Iliad* 2.557–558, which suggests that Salamis had ancient ties to Athens.
113. The event is otherwise unknown.
114. Fr. 22a West.
115. This has not been said explicitly, but may be implied at 1363a5–7, 1371b14–17.
116. *Cypria* Fr. 31.
117. The allusion is unclear. The idea may be this: Chares confessed to wickedness, hoping thereby to lesson his penalty. Eubulus points out that the use of such a tactic is on the rise and should not be tolerated, citing Plato in support.

advantageous or disadvantageous. Outsiders are most persuasive[118] also about such matters; but most persuasive are the ancient witnesses; for they are not corruptible.

The one who has no witnesses as confirmation of testimony should say that judgment must be made on the basis of likelihoods, and that this is what "the best consideration" requires. And that it is not possible for likelihoods to deceive for a sum of money. And that likelihoods are not convicted of perjury. The one who has witnesses should say to the one who does not have them that likelihoods are not liable to trial, and that there would be no need for witness if it were enough to consider [the case] on the basis of the arguments.

Some pieces of testimony are about oneself, others about the opponent, and some are about the thing at issue, others about character, so it is evident that there is never a scarcity of useful testimony; for if there is no testimony relating to the thing at issue, whether agreeing with oneself or contrary to the opponent, still there will be some about character, whether pointing to one's own decency or one's opponent's baseness. Other points about a witness—whether he is a friend, an enemy, or in between, whether he is reputable, disreputable, in between, and all other such differences—should be based on the very same topics on which we state enthymemes.

As regards contracts, the use of arguments extends this far, to amplifying or reducing, that is, making them persuasive or unpersuasive—if on one's side, persuasive and in control, if on the opponent's, their contraries. With a view to establishing their persuasiveness or un-persuasiveness, they are no different than dealing with witnesses; for whatever sorts of people signatories and custodians are, in these reside the persuasiveness of the contracts.

If it is agreed that a contract exists, this should be amplified if on one's side; for a contract is a law applying to individuals and particular cases, and while contracts do not make the law to be in control, the laws do make contracts that are in accord with the laws to be in control, and, in general, the law itself is a sort of contract, so that whoever disobeys a contract or does away with it, it is the laws that he does away with. Further, many transactions, especially the voluntary ones, are carried out in accord with contracts, so that if these are without control, the business relations of people with each other are done away with. And the other things that are fitting [to say] are easy to see.

If the contract goes contrary to oneself and along with the opponents, then, in the first place, the things that are fitting [to say] are the very ones that one might use to fight against a contrary law; for it would be absurd if we think, on the one hand, that we must not obey the laws whenever they are not correctly laid down but those who put them in place erred, and, on the other, that it is necessary to obey contracts. Second, one can say that the judge is an umpire of what is just; he must consider, then, not this [written contract], but as [construed] in the more just way. And say that while it is not possible to alter what is just by deception or compulsion (for it is

118. Reading πιστότατοι.

something natural), contracts are among the things that come about both through people being deceived and through their being compelled. In addition, one should look to see whether the contract is contrary to any written or common laws, and in the case of written ones, whether to domestic ones or to foreign ones, and next whether it is contrary to other contracts, whether later or earlier; for one should look to see whether the later are the controlling ones (but the earlier ones without control),[119] or whether the earlier ones are correct (but the later ones are deceptive)—whichever of the two may be useful. Further, one should see what is advantageous—whether the contract is in any way contrary to the interests of the judges, and anything else like this; for these things too are similarly easy to see.

Results of torture are a sort of evidence and seem to carry conviction, in that a sort of compulsion is also involved. And it is not difficult in their case, either, to state the possibilities [regarding their use] on the basis of which to provide amplification, if the results of torture are on one's side, [by saying] that they are the only sorts of testimony that are true. But if they go contrary to oneself and along with the opponent, one could refute them by stating the truth generally about the kind to which the results of torture belong; for people speak falsely no less than truly when being tortured, whether through resilience they obstinately refuse to speak the truth, or readily tell lies to stop the torture more quickly.[120] And one must be able to refer to paradigms of this sort of thing that have actually happened and are known to the judges.

As regards oaths, there is a fourfold division to make: either to offer one and accept one; do neither; do one but not the other (and of these, to offer but not accept, or accept but not offer). Further, in another way, beyond these, there is the question of whether an oath was already sworn either by oneself or by the other party.

If one does not offer, one can say that people swear false oaths easily; that the one who has sworn will not pay, while those who have not sworn, one thinks, will be condemned [by the judges]; and that this risk will be better, the one in the hands of the judges; for one trusts them, not the opponent.

If one does not accept an oath oneself, one can say that an oath is a substitute for money, and that if one were a base person, one would have accepted it (for it is better to be base for something than for nothing, and one who accepts the oath wins the case, while the one who does not accept it does not), and so one's not swearing an oath would be due to virtue, not to [a fear of] committing perjury. And Xenophanes' remark is fitting, that "a challenge to accept an oath made to a pious man is not itself the equal of one made to an impious man."[121] Rather, it would be like a strong person challenging a weak one to strike a blow or be struck one.

If one does accept an oath, one can say that one trusts oneself, not the other. And, reversing the remark of Xenophanes, one should say that this way it is equal, if the

119. Reading ἄκυροι δ'αἱ πρότεραι.
120. Reading τἀληθῆ and ἤ τἀληθῆ.
121. A14 DK.

impious person offers and the pious one swears. And that it would be terrible to be unwilling to swear an oath oneself on matters that one thinks it fitting for others to judge after swearing one.

If one offers an oath, one can say that it is pious to be willing to turn the matter over to the gods, and that there is no need for the opponent to require other judges; for one is offering him the judgment. And that it would be absurd not to be willing to swear about things we demand that others swear about.

But since it is clear how one should speak in each of these cases, it is also clear how one should speak when they are coupled—for example, if one wishes to accept but not to offer, if one wishes to offer but not accept [an oath], and if one wishes to accept and offer, or to do neither; for these are necessarily composed of the ones discussed, so that the arguments too are composed of the ones discussed.

And if one has already taken an oath, and an oath contrary [to the present case], one should say that it is not perjury; for while doing injustice is voluntary, and committing perjury is doing injustice, what is done due to force or deception is involuntary. Here one must conclude that perjury too is something committed by thought, not by mouth. If, on the other hand, the oath is contrary to the opponent's case and has been sworn by him, one should say that those who do not abide by what they have sworn do away with everything (for this is in fact why judges take an oath before administering the laws): "my opponents demand that you abide by the oaths you swore you would judge by, while they themselves do not abide by theirs." And there are many other things one might say by way of amplification.

BOOK 2

2.1
Rhetoric Is for the Sake of Judgment

These, then, are the things on the basis of which one should exhort as well as dissuade, praise as well as blame, accuse as well as defend, and these are the sorts of beliefs and premises useful in relation to the means of persuasion belonging to these; for enthymemes special to (one might almost say) each kind of speech are concerned with these and composed of these.

But since rhetoric is for the sake of judgment (for people judge deliberations and a trial is a judgment), it is necessary [for the speaker] to look not only to the argument, that it be demonstrative and persuasive, but also to establish both himself and the judge as being of a certain sort; for it makes a great difference with a view to persuading—especially in deliberative speeches, but next in judicial ones—both that the speaker appear to be of a certain quality and that his listeners take him to be disposed in a certain way toward them, and if, in addition, they too will be disposed

in a certain way. For the speaker to appear to be of a certain quality is more useful in deliberative speeches, and for the listener to be disposed in a certain way in judicial speeches;[122] for things do not appear the same to those who love and those who hate, nor to those who are angry and those who are mild-mannered, but either altogether distinct or distinct in degree. To the one who loves, the person about whom he makes his judgment seems not to do injustice or to do little injustice, but to the one who hates, it is the contrary; to one having an appetite and being expectant, if something in the future is pleasant, it appears that it will both come about and be good, but to the one who feels none and is disgusted, the contrary.

The causes due to which speakers themselves are persuasive are three; for that is how many things there are, outside demonstrations, due to which we trust. And these are practical wisdom, virtue, and goodwill; for speakers are deceptive in what they say or advise due to all of these or due to one of them; for either it is due to lack of practical wisdom that they do not form beliefs correctly; or, though forming beliefs correctly, it is due to depravity that they do not say what seems to be so to them; or they are practically wise and decent people, but not people of goodwill, so that it is possible for them not to give the best advice though they know it; and beyond these there is none. It is necessary, therefore, for a person who seems to have all these to be convincing to his listeners. The basis on which we might appear to be practically wise and excellent people must be grasped from our discussions of the virtues;[123] for it is on the basis of the same things that a person would establish both another person and himself as being of a certain sort. About goodwill and friendliness, on the other hand, we must speak in our discussion of the feelings.[124]

The feelings are those things due to which people, by undergoing a change, differ in their judgments, and that entail pain and pleasure—for example, anger, pity, fear, and other such things, and their contraries. And with respect to each a division into three must be made. I mean, for example, in speaking of anger, by being disposed in which way people are angry, at whom they are usually angry, and for which sort of things; for if we possessed one or two of these, but not all, it would be impossible to produce anger in another person. And similarly in the case of the others. Just as we have given a catalog of premises in the case of the things discussed earlier,[125] then, let us do so about these too, and let us divide them in the way mentioned.

2.2
Anger

Let anger be desire, involving pain, for apparent revenge, because of apparent contempt on the part of someone unfitted to treat the person himself, or one of those

122. Retaining τὸ μὲν . . . δίκας.
123. 1.9.
124. Friendliness is discussed in 2.4; goodwill is not further discussed.
125. 1.3–15.

close to him, with contempt. If, then, this is what anger is, the angry person must always be angry at some particular individual (for example, at Cleon not at the human kind), because the individual has done or is going to do something to him or one of those close to him, and all anger must be followed along with some sort of **1378^{b}1** pleasure, the one from the hope of being revenged; for it is pleasant to think that he will get what he aims at, and no one aims at things that are apparently impossible for him to attain, and the angry person aims at what it possible for him to attain.[126] That is why it has been well said of spirit that:

> Far sweeter than dripping honey
> It grows in the hearts of men.[127]

For a sort of pleasure actually follows along because of this, and also because angry people spend their time in taking revenge through thinking, and so the appearance that occurs at that time produces pleasure, as in the case of dreams.

Since contempt is an activation of belief concerned with what appears to be worth nothing (for we think that both good things and bad ones are worth serious attention, as is what leads to them, while whatever amounts to little or nothing we suppose to be worthy of none), there are three forms of contempt: despising, spite, and wanton aggression; for the one who despises is contemptuous; for the things people despise are the ones they think are worth nothing, and the ones they think are worth nothing they have contempt for.

And the one who is spiteful appears to show contempt; for spite is an impediment to the wishes [of the other], not in order to get something for himself, but in order that the other not get it. Since, then, he does it not to get something for himself, he is showing contempt; for it is clear that he does not suppose that the other will harm him (for then he would be afraid and would not show contempt), nor that the other might benefit him in anything worth mentioning (for then he would be taking care so as to be his friend).

And the wantonly aggressive person also shows contempt; for wanton aggression consists in doing or saying things that involve shame for the one who suffers them, not in order that something or other [beneficial] may come about for the agent himself, or because something [bad] has happened to him, but in order to take pleasure in it; for those who are doing the same thing back are not committing wanton aggression but revenging themselves. The cause of pleasure to those who commit wanton aggression is that they think that they become more superior themselves by doing evil [to others] (that is why young people and rich ones are prone to wanton aggression; for they think themselves superior when they commit wanton aggression). And dishonor is characteristic of wanton aggression, and one who dishonors treats with contempt; for what is worth nothing receives no honor, whether for good or for bad.

126. Reading ὁ δ᾽ὀργιζόμενος . . . αὐτῷ.
127. Homer, *Iliad* 18.109–110. 1370^{b}11–12 quotes in part.

That is why Achilles, when angered, says, "He has dishonored me; for he has taken away my prize and keeps it," and "[treats me] like some dishonored vagabond,"[128] as one angered because of these things.

And people think it fitting that they be highly esteemed by those inferior in birth, in capacity, in virtue, and, in general, in whatever they themselves are largely superior in—for example, in money, the rich man by the poor man; in speaking, one skilled at speaking by one incapable in speaking; ruler by ruled; and one who thinks himself worthy of rule by one worthy of being ruled. That is why it has been said that, "great is the spirit of Zeus-cherished kings," and "yet it may be that even afterwards he has a grudge";[129] for kings are vexed because of their superiority. Further, [a person thinks it fitting that he be highly esteemed] by those he thinks he should be treated well by—that is, the ones he has treated well, is treating well, or wishes or has wished to treat well, either himself or someone else because of himself or someone among those close to him.

It is already evident from these considerations by being disposed in which way people are angry, at whom they are angry, and because of what sorts of things. For they are angry when they are pained; for the one who is pained aims at something. If, then, anyone in any way directly obstructs, for example, a thirsty man from drinking, or if he does not do so directly, appears to be doing the same thing,[130] or if he acts against him or does not assist him in acting, or annoys him in some other respect when he is so disposed[, as to aim at something], at all such people he is angry. That is why those who are ill, poor, at war,[131] in love, thirsty—in general, those with an appetite and not successful in satisfying it—are irascible, that is, easily provoked to anger, especially toward those who show contempt for their present condition.[132] For example, the one who is ill is easily provoked because of things related to his illness, the poor one because of things related to his poverty, the one at war because of things related to the war, the one in love because of things related to his love, and likewise too in the other cases; for each is predisposed by his present feeling to his particular anger.

Further, [a person is angry] if he happened to be expecting the contrary; for what is to a high degree contrary to belief pains more, just as what is to a high degree contrary to belief delights more, if what is wished for comes about. And that is why it is evident from these considerations what opportune moments, times, dispositions, and stages of life are the sort in which people are more easily moved to anger, and in what conditions, and when, and when they are more in these, they are more easily moved.

People so disposed, then, are easily moved to anger, and they are angry at those who ridicule, scoff, or jibe[133] at them; for they commit wanton aggression. And at

133. *NE* 4.8.

those who do such actions as are signs of wanton aggression—and these must be such as are neither payback for something nor beneficial to those who do them; for actions of this sort are immediately taken to be due to wanton aggression. And at those who speak badly about, or despise, things they themselves take most seriously—for example, those who take pride in philosophy, if someone does this about philosophy, or those who take pride in their looks, if someone does it about their looks, and likewise in the other cases. And they do so much more if they suspect that they themselves do not really possess [the things they take pride in], either at all or in any strong sense, or do not seem to; for when they very confidently think themselves to be superior in the things that are being jibed at, they give it no thought. **1379**^{b}**1**

Also, [people are angry] at friends more than at those who are not friends; for they think it more fitting to be treated well by them than not. And at those who are in the habit of honoring or caring about them, if, contrariwise, they do not care about them in the same way; for in fact they think they are being despised by them too; for otherwise they would treat them in the same way [as before]. And at those who do not treat them well in return, and those who do not give equally in return; and at those who do things contrary to [their wishes], if they are inferiors; for all such people appear to despise them: the latter as if looking down on them as if they were inferiors; the former as if they had been treated well by inferiors. And more so at those who are of no account, if they show contempt in some way; for anger characteristic of contempt is assumed to be at those unfitted to show it, and it is fitting for inferiors not to show contempt.

Also [people are angry] at friends if these do not speak well of them or treat them well, and yet more so if they do the contrary, and if they are imperceptive of those in need, as in the case of Plexippus in Antiphon's *Meleager*;[134] for not to be perceptive is a sign of contempt; for what we care about does not escape our notice. And at those who rejoice or are fully in good mood during their strokes of bad luck; for it is a sign of being either an enemy or one showing contempt. And at those who do not care if they pain them; that is why people are angry at those who bring bad news. And at those who listen to bad things about them or contemplate base things of theirs; for these are like contemptuous people or enemies; for friends feel pain jointly, and all are pained when they contemplate base things that are properly their own.

Further, [people are angry] at those who show contempt for them in front of five sorts of people: those they take to be their rivals, those they admire, those they wish to be admired by, those in front of whom they feel shame, or those who are ashamed in front of them. If someone shows contempt for them in front of these, they are yet more angry. And at those who show contempt for things of the sort it would be shameful for them not to help—for example, parents, children, wives, and

134. Plexippus, the uncle of Meleager, was angry at the latter for insensitively giving his prize (the skin of the Calydonian boar) to Atalanta, with whom he was in love. The play, which 1399^{b}26–27 also quotes, is not extant.

those they rule. And at those who do not return a favor; for the contempt shown is beyond what is fitting. And at those who are self-deprecating in relation to what they take seriously; for then self-deprecation is [a sign of] despising. And at those who treat others well, if they do not also treat them that way; for then this too is [a sign of] despising: not thinking them worthy of what they do for all and sundry. And forgetfulness is also productive of anger—for example, forgetfulness of their names, although it has to do with such a small matter; for even forgetfulness seems to be a sign of contempt; for forgetfulness comes about through indifference, and indifference is a sort of contempt.

Those, then, at whom people are angry, by being disposed in which way they are angry, and because of what sorts of things, have at one and the same time been stated. And it is clear that a speaker might need to establish by his speech the sort of state in his listeners as will dispose them to anger, and to establish his opponents as liable for those things about which one gets angry, and as being themselves the sort of people one gets angry at.

2.3
Mild-Manneredness

Since becoming angry is the contrary of becoming mild-mannered, and anger to mild-manneredness, we must grasp by being disposed in which way people are mild-mannered, to whom they are mild-mannered, and because of what sorts of things they become mild-mannered. Let becoming mild-mannered, then, be a settling down and coming to rest of anger. If, then, people are angry at those who show contempt, and showing contempt is something voluntary, it is evident that they are mild-mannered toward those who do none of these things, or do them involuntarily, or are [only] apparently of this sort. And toward those wishing to do the contrary of what they have done. And toward all who are such towards themselves too; for no one seems to show contempt for himself.

Also, toward those who admit and regret; for taking as just recompense their being pained at what they have done, people cease to be angry. A sign of this is found in the punishment of slaves; for we punish more severely those who dispute and deny, while we cease our spirited response toward those who agree that they are justly punished. And the cause of this is that to deny evident facts is shamelessness, and shamelessness shows contempt and [in particular] despising—at any rate, we feel no shame before those we deeply despise.

Also, toward those who humble themselves before them and do not dispute with them; for they appear to agree that they are inferior, inferiors are afraid, and no one who is afraid shows contempt—indeed, the fact that anger ceases toward those who humble themselves is something that even dogs make clear by not biting those who are sitting.[135] And toward those who are serious toward serious people; for it seems

135. And so seem to pose no threat.

to them that they are being taken seriously rather than being despised. And toward those who have shown them greater favor. And toward those who are begging a favor and entreating them [not to be angry]; for they are humbler.

Also, toward those who are not being wantonly aggressive, satirizing, or showing contempt toward anyone, or not against good people, or people like themselves; {and in general, the things that inspire mild-manneredness should be looked for from their contraries.}[136] Also, they do not get angry at those whom they fear or feel shame in front of, and are not angry as long as they are thus disposed; for it is impossible to be afraid and angry at the same time. And people are not angry, or are less angry, at people who have done things because of anger; for they do not seem to have acted because of contempt; for no one shows contempt while angry; for showing contempt is painless, while anger involves pain. Also, people are mild-mannered toward those who feel shame in front of them. **1380^{b}1**

Also, it is clear that people whose condition goes contrary to being angry are mild-mannered—for example, in the condition of amusement, of laughter, in a holiday mood, in a condition of prosperity, of success, of satisfaction—in general, in a condition of painlessness, of pleasure that does not result from wanton aggression, and of decent hope.

Further, when they have spent time with their anger and are not in the first burst of it; for time causes anger to cease. And vengeance previously taken on one person causes a greater anger against another person to cease. {That is why when someone asked Philocrates on an occasion when the people were angry, "Why do you not defend yourself?" he answered wisely, "Not yet." "But when?" "When I see someone else has been accused";}[137] for people become mild-mannered when they have spent their anger on someone else. This happened in the case of Ergophilus; for though the people were more embittered against him than against Callisthenes, they let him go because they had condemned Callisthenes to death on the previous day.

Also, if they pity [the offenders], especially if these have suffered a greater bad thing than they, when angry, would have done to them; for they think they have, as it were, got their revenge. And if they think that they themselves have done injustice and suffered justly; for anger does not arise at what is just;[138] for they no longer think that they are suffering beyond what is fitting, and this, we saw,[139] is what anger requires. That is why one should inflict a preliminary punishment by words; for even slaves are less vexed when so punished.

Also, if the offended think that the ones punished will not perceive that the punishment suffered is due to [the offended] themselves and is in return for what they themselves have suffered; for anger is directed at a particular individual,[140] as is

136. Probably out of place.
137. Probably out of place.
138. Reading οὐ γίγνεται ἡ ὀργὴ πρὸς τὸ δίκαιον.
139. 1378^{a}31–32.
140. Reading ἡ γὰρ ὀργὴ πρὸς τὸν καθ' ἕκαστόν ἐστιν.

clear from the definition.[141] That is why the poet has correctly written, "Say it was Odysseus, sacker of cities,"[142] on the supposition that he has not been revenged if [Polyphemus the Cyclops] has not perceived both by whom and in return for what [he had been blinded]. So people are not angry either at all the others who do not perceive these things, or any further at the dead, on the supposition that they have suffered the ultimate, and do not feel pain or have perception, which is what angry people aim at. That is why the poet, in wishing Achilles to cease his anger at Hector once he was dead, well said, "For it is senseless clay that he outrages in his wrath."[143] It is clear, then, that those who wish to make their listeners mild-mannered should speak from these topics, making, on the one hand, the listeners be of that sort and, on the other, rendering those at whom they are angry as either fearsome, or worthy of being ashamed in front of, or as having shown them favor, or as involuntary agents, or as deeply pained by what they have done.

2.4
Friendliness and Enmity

Let us say whom people love and hate, and because of what, after having defined friendliness and being friendly. Let being friendly, then, be wishing for someone what one thinks to be good things, for his sake not for one's own, and to be productive in action of such things so far as one can. And a friend is one who loves and is loved in return;[144] and people think they are friends when they think they are both this way. These things being presupposed, a friend is necessarily someone who shares in one's pleasure at good things and in one's pains at painful ones, not because of something else, but because of oneself; for all enjoy it when the things they wish for come about, and are pained when the contrary ones do, so that the pains and the pleasures are signs of wish. And friends are the ones, then, to whom the same things are good and bad and who are friends and enemies with the same people;[145] for it is necessary for them to wish for the same things. So the one who also wishes for another the very things he wishes for himself is manifestly a friend to him.

Also, people are friendly to those who have done good things for them, whether for themselves or for those they care about (be these great things, or done eagerly, or at opportune times), and for their sake—or to those they think wish to do good things. And to the friends of their friends, and to those who like the same people they like. And to those who are liked by those who are liked by them; those who have the

same enemies they have and hate those they hate; and those who are hated by those who are hated by them; for the same things seem to be good to all these [as seem to be good] to themselves, so that these others wish for the things that are good for themselves, which is precisely the thing, as we saw, that is characteristic of a friend.

Further, [people are friendly] to those who are able and disposed to do good things for others with regard to money and with regard to safety; that is why they honor generous and courageous people. Also, to those who are just. And they suppose that those who do not live off others are just: the ones who are such as to live by their own labor, and, of these, the ones who do so from farming, and, of these, above all the ones who work the land themselves. And to those who are temperate, because they are not unjust. And to those who mind their own business, due to the same consideration.

And [we are also friendly] to those we wish to be friends with, if they appear to wish it; and those who are good in accord with virtue are like this, as are those who have a good reputation, either among all, or among the best people, or among those who are admired by us, or among those who admire us. Further, to those who are pleasant to pass the time with and spend our days with. Such people are those who are calm and not critical of our errors, and neither lovers of victory nor quarrelsome people are like this; for all such people are pugnacious, and pugnacious people manifestly wish for the contrary things. And [we are also friendly] to dexterous people in mocking and standing one's ground [when mocked]; for both strive[146] toward the same thing as their neighbor: to be capable of jibing and of taking a jibe in a gracious way. Also, to those who praise the good qualities that belong to us, and of these, especially the ones that we are afraid may not belong to us. And to those who are refined in appearance, dress, and in their whole way of life. And to those who do not **1381^{b}1** reproach us either for our errors [in their regard] or for their benefactions [to us] (for both lots are inclined to be critical of us).

Also, [people are friendly] to those who are not inclined to remember injuries or store up accusations, but instead are easily appeased; for as they take them to be toward others, so they think they will be toward themselves. And to those who do not speak badly, or even want to know the bad things, either about their neighbors or about themselves, but instead the good ones; for these are the things a good person does. And to those who do not oppose others who are angry or being serious; for such people are pugnacious. And to those who are in some way seriously disposed toward them—for example, who admire them, take them to be excellent people, and find enjoyment in them, and especially those who feel this way about things they especially wish for themselves, or admire, or believe to be excellent, or take pleasure in. And to those who are like themselves and have the same practices, provided they do not become too annoying or get their livelihood from the same thing; for then it becomes a case of potter versus potter. And to those who have an appetite for the

146. Reading ἀμφότεροι.

same things, when it is possible to share these at the same time; otherwise the same thing results as in the previous case.

Also, to those they are so disposed toward that they are not ashamed of what seems to be [bad], provided they do not despise them. And to those they are so disposed toward that they are ashamed of what truly is [bad]. And they are friendly to, or wish to be friends with, those they are rivals of, or those they wish to be emulated by, not envied. And to those together with whom they do good things, unless greater bad ones are going to result for themselves. And to those[147] who are equally friendly to their friends both absent and present, which is why all are friendly to those who are such even toward dead friends. And, in general, those who are intensely friendly to their friends and are not inclined to leave them in the lurch; for among good people they are especially friendly to those who are good at being friendly. Also, those who do not falsify themselves to them; and those who tell them even the bad things about themselves are like this; for it was mentioned that in front of friends we are not ashamed of things that seem [bad]; if, then, someone who is ashamed is not a friend, the one who is not ashamed is like a friend. And those who are not fearsome and in whom we have confidence; for no one is friendly to someone he is afraid of.

The forms of friendship are companionate, intimate, familial, and others of this sort. And things productive of friendship are doing a favor; doing it without being asked to do it; and not advertising it when it has been done; for then it appears to be done for the sake of the friend and not because of something else.

As regards enmity and hating, it is evident that they are to be theoretically grasped from their contraries. And the things productive of enmity are anger, spite, and accusation. Anger arises from things done against oneself, enmity also not from things done against oneself; for if we take someone to be of such-and-such sort, we hate him. And anger is always concerned with particulars, such as Callias or Socrates, while hate is also directed against kinds; for everyone hates the thief and the sycophant. And the former is curable in time, while the latter is not curable. And the former aims at pain [for its object], the latter at evil; for the angry person wishes [his revenge] to be perceived, while to the latter it makes no difference; and painful things are all perceptible, while the greatest evils are the least perceptible ones, [for example,] injustice, foolishness; for the presence of the evil does not at all cause pain. And anger involves pain, while hate does not involve pain; for the angry person is pained, while the one who hates is not. And the angry person may feel pity when many [revengeful] things have happened, while the one who hates never does; for the former wishes the one he is angry at to suffer in turn, while the latter wishes for him not to exist.

It is evident, then, from these considerations that it is possible to demonstrate that people are enemies or friends, to make them so when they are not, to refute those who claim to be friends or enemies, and to draw those who because of anger or enmity are our opponents toward whichever of them one may deliberately choose.

147. Reading τοῖς.

What sorts of things people fear, and whom, and by being disposed in which way [they feel fear] will be evident from what follows.

2.5
Fear and Confidence

Let fear, then, be a sort of pain or disturbance coming from the appearance of a future destructive or painful evil; for people do not fear all evils (for example, that one will become unjust or slow-witted), but rather those that are capable of [causing] great pains or great destructions, and if they appear not far off but close at hand, and so about to happen. For people do not fear what is very far off; for they all know that they will die, but because it is not close at hand, they care nothing about it.

If, then, this is what fear is, necessarily the sorts of things that are fearsome are whichever ones appear to have a great capacity for destroying or causing harms that lead to great pain. That is why even the signs of such things are fearsome; for what is fearsome appears close at hand. In fact, this is what danger is: the approaching of something fearsome. Such signs are enmity, anger on the part of those capable of doing something [fearsome] (for it is clear that they wish to do it, so that they are close to doing it), and injustice having this capacity (for the unjust person is unjust by deliberate choice). Also, virtue outraged by wanton aggression when it has this capacity; for it is clear that when outraged by wanton aggression, it deliberately chooses **1382^{b}1** [to retaliate], always [does so], and now it can. And fear on the part of those capable of doing something [fearsome]; for someone like that is also necessarily in readiness.

Since ordinary people are worse [than they should be], subjugated to profit, and cowardly in times of danger, being in the power of another is for the most part fearsome, so that the accomplices of someone who has done something terrible are fearsome, as likely to inform on him or leave him in the lurch. And those capable of doing injustice are fearsome to those capable of having injustice done to them; for people, for the most part, do injustice when they have the capacity to do so. Also, those who have been treated unjustly, or think they have been treated unjustly; for they are always on the lookout for an opportune moment [to take revenge]. And those who have done injustice, if they are capable [of doing something fearsome], are fearsome, as being anxious about retaliation; for this was assumed to be something fearsome. And those who are competitors for the same things, whenever it is not possible for both to share them at the same time; for people always make an enemy of such competitors.

Also, those who are fearsome to others who are stronger than us [are fearsome]; for those people are capable of harming us more, if they are capable of harming even those who are stronger than us. And (due to the same thing) those feared by others who are stronger than we are. And people who have destroyed those stronger than they are. And people who have attacked those weaker than they are; for those are

either already fearsome, or will be when they have grown stronger. And among those we have treated unjustly, or are either enemies or rivals, it is not the quick-tempered or outspoken ones [who are fearsome], but the mild-mannered, the self-deprecating, and the unscrupulous ones; for in their case it is unclear if they are close [to taking revenge], so that it is never evident that they are far off [from doing so].

All fearsome things that people have committed in error and are not possible to rectify—but are either wholly impossible or not possible for them but are for their opponents—are more fearsome. Also when there are no possibilities of help, or not easy ones.

Simply speaking, the fearsome things are the ones that are pitiable when they happen or are going to happen to others.

These, then, are pretty much (one might almost say) the most important things that are fearsome and that people fear. Let us now speak about how the ones who are afraid are disposed.

If fear involves a certain expectation of undergoing some destructive suffering, then, it is evident that no one is afraid if he is among those who think that they will suffer nothing at all. Nor will people be afraid of things they do not think they will suffer, nor of people at whose hands they do not think they will suffer, nor at times when they do not think so. Necessarily, therefore, people who think they might suffer something are afraid, and are afraid of those at whose hands they think they might do so, and of the things and at the times that they think they might suffer. And people do not think they will suffer when they are, or seem to themselves to be, **1383a1** in the midst of great prosperity; that is why they exhibit wanton aggression, contempt, and rashness (and what makes them such is wealth, strength, many friends, and [great] capacity). Nor are people afraid who consider that they have already suffered every terror and have grown coldly indifferent to the future, like those being flogged to death and already nearly dead; on the contrary, for them to be afraid there must be some hope of being saved from what they are anxious about. A sign of this is that fear makes people inclined to deliberate, and yet no one deliberates about hopeless things.

So whenever it is better that [the listeners] should feel afraid, [the speaker] should make them feel as if they were to suffer (for even others, greater than them, have suffered), and he should prove that there are others like them who are suffering or have suffered at the hands of those from whom they did not think [it possible], and things they did not expect, and at a time they did not think [it possible].

Since it is now evident what fear is, what the fearsome things are, and by being disposed in which way each is afraid, it is also evident on the basis of this what being confident is, what sorts of things people feel confident about, and by being disposed in which way people feel confident; for confidence is the contrary of fear, and what inspires confidence is the contrary of what is fearsome. So [confidence's] hope of things providing safety involves an appearance of them as being close at hand, and of fearsome things as either non-existent or as being far away. What inspires confidence

is the remoteness of what is dreadful and the closeness of what provides safety.[148] [Things that inspire confidence] also include ways of rectifying the situation, or many possibilities of help, or great ones, or both. Or the fact that they have not been treated unjustly or treated others unjustly, that they have no competitors, or that these have no capacity. Or that those having capacity are their friends, or that they have either done them good or received it from them. Or the fact that those whose advantage is the same as theirs are more numerous, or stronger, or both [than those opposed].

People feel confident by being disposed as follows: when they think they have often been successful and not suffered, or have often come into terrible situations and escaped them (for people become free from the feeling [of fear] in two ways: either by not having been put to the test or by having the means to help, just as in dangers at sea those without experience of a storm are confident about what will happen, as too are those who have the means to help due to their experience); also, when something is not fearsome to people like themselves, their inferiors, or those whose superiors they think themselves to be; and they think themselves superior to those they have defeated, either these themselves, their superiors, or their equals; also, if they think they have more or better resources, superiority in which makes them fearsome—these are a quantity of money, of supporters, of friends, of lands, and of armaments for war, either all of them or the most important ones.

Also, if they have done no injustice to anyone, or not to many, or not to those in front of whom they have anything to fear, {and, in general, if their relations with the gods are good, both as told in other ways and from signs and oracles}[149] (for anger is something that inspires confidence, not to do injustice but to suffer injustice is productive of anger, and the divine is supposed to help those who have suffered injustice). And people feel confident when, putting their hands to something, they think they are not likely [here and now] to suffer, will not suffer in the future, or will be successful.[150]

About both fearsome things and confidence-inspiring ones, then, let this much be said.

2.6
Shame and Shamelessness

What sorts of things people are ashamed of or are shameless about, in front of whom, and how—by being disposed in the relevant way [they feel shame]—is clear from the following. Let shame be a sort of pain or disturbance concerned with the evils—whether present, past, or future—that appear to bring a person into disrepute, and shamelessness a sort of contempt and lack of feeling concerning these same things.

148. Reading τὰ σωτήρια.
149. Probably out of place.
150. Reading μηδὲ πείσεσθαι.

If, then, what has been so defined is shame, necessarily people are ashamed of such evils as seem shameful either for themselves or for those they care about. And works due to vice are like this. For example: Throwing away a shield or fleeing; for these are due to cowardice. Refusing to return a deposit; for this is due to injustice. Having sexual relations with those one should not, or where one should not, or when one should not; for these are due to intemperance. Making a profit from petty or shameful things or from incapable people, such as the poor or the dead—hence the proverb, "He would even rob a corpse"; for this is due to shameful profiteering and acquisitiveness. Not helping out with money when one can, or helping less. Being helped by those with fewer resources. Seeking a loan from someone when he seems likely to ask for one, and asking for one when he seems likely to ask to have one returned, and asking to have one returned when he seems likely to ask for one, and praising in order to seem to be asking, and though one has failed in the effort, to ask nonetheless; for all these are signs of acquisitiveness. Praising those present (a sign of flattery).[151] Overpraising good things and minimizing bad ones, and feeling over-pained at the pain of someone present, and all other such things; for these are signs of flattery. Not enduring exertions that older people endure, or those who are effeminate, of higher rank, or, in general, more incapable [of enduring them]; for all are signs of softness. Accepting good deeds from another, and doing so often, or reproaching someone who did something good [for you]; for all these are signs of smallness of soul and humbleness. Talking about oneself all the time, and making pronouncements, and claiming other people's achievements as one's own; for these are signs of boastfulness. Likewise too for the works, signs, and the like that are due to the other vices of character; for these are shameful and productive of shame.

In addition to these, it is shameful not to share in the noble things in which all—or all those like oneself, or most of them—share. By "those like oneself" I mean those of the same nation, fellow citizens, those at the same stage of life, those of the same birth, and, in general, one's equals; for it is already shameful not to share, for example, in education to the same extent, and similarly for other things. And all these are more shameful if they appear to be due to oneself; for in this case they already seem more due to vice: whenever one is oneself the cause of one's past, present, or future condition.

People feel shame when they suffer, have suffered, or are going to suffer such things as lead to dishonor and reproaches—such things are those in regard to the services of the body or those subserving shameful works,[152] of which being treated with wanton aggression is one, and while those in regard to intemperance may be either voluntary or involuntary, those in regard to force are involuntary; for enduring them and not defending oneself against them is due to a lack of manliness and cowardice.

151. Reading τὸ δ᾽ἐπαινεῖν παρόντας καλοκείας.
152. Reading ταῦτα δ᾽. . . αἰσχρῶν.

These, then, and the like are the things people are ashamed of. And since shame is an appearance concerning disrepute, and this for its own sake and not for the sake of its consequences, and since no one cares about reputation [by itself], but rather does so because of those who have the pertinent opinion, necessarily a person feels shame in front of those he takes account of. And he takes account of those who admire him, those whom he admires, those whom he wishes to be admired by, those whose rivals he is, and those whose opinion he does not despise.

People wish to be admired by those and to admire those who possess any good from among those that bring honor, or from whom they desperately need something that those people control—for example, their lovers. And they are rivals of those who are like them, and they give thought to practically wise people as tellers of the truth, and their elders and well-educated people are like this.

And they feel more shame at things done in front of [everyone's] eyes and in the open; hence too the proverb, "Shame is in the eyes." This is why people feel more shame in front of those who will always be with them and those who notice what they do, because in both cases they are in front of their eyes. And in front of those **1384b1** not liable to the same charges; for it is clear that the contrary things seem acceptable to them. {And in front of those not inclined to be sympathetically considerate to those who appear to have erred;}[153] for what one does oneself, it is said, is what one is not indignant at one's neighbor for doing, so it is clear that what one does not do oneself one is indignant at him for doing. And in front of those inclined to gossip to many people (for there is no difference between its not seeming so to them and their not gossiping about it); and those inclined to gossip are those who have been treated unjustly, because they keep on the lookout, and those who speak badly of others (for if indeed they do so about those who have committed no error, they will do so still more about those who have committed an error). And in front of those who spend their time on their neighbors' errors—for example, satirists and writers of comedies; for these are, in a way, people who speak badly of others and are, in a way, gossips. And before those in front of whom they have never failed; for they are in the position of people admired. That is also why they feel shame before those asking for a favor for the first time, as not yet being disreputable in front of these—and people who recently wished to be their friends are like this (for they have seen their best sides, which is why Euripides' reply to the Syracusans is apropos[154])—and among old acquaintances who know nothing [against them].

And people are ashamed not only of the shameful things that have been mentioned, but also of all the signs of shamefulness—for example, people are ashamed not only of their engaging in sexual intercourse but also of the signs of it, and not

153. Probably out of place.

154. A medieval scholiast tells us that Euripides (the tragic poet) was sent to negotiate peace with the Syracusans and, finding them unwilling, said: "Men of Syracuse, even if because of nothing else, then at least because we are just now [for the first time] in need of you, you should be ashamed to reject us, your admirers."

only of doing shameful things, but also of talking about them. Similarly, people are not only ashamed before those who have been mentioned, but also before those who will reveal things to the former—for example, their servants and friends. But, in general, they are not ashamed before those whose opinion in respect of their telling the truth they despise (for no one feels shame before small children and beasts), nor of the same things before acquaintances and unknown people, but before acquaintances they are ashamed of what seems shameful in relation to truth, and before those from far away they are ashamed of what seems shameful in relation to custom.

People would feel ashamed if they were disposed as follows: first, if there were certain people who were related to them as are those in front of whom we said they feel shame. And these, as we saw,[155] are the ones who are admired by them, who admire them, by whom they wish to be admired, or from whom they want something needed that they will not get if they are disreputable. And [second] if these are either seeing what they are doing (as Cydias said publicly about the allotment of land in Samos;[156] for he thought that the Athenians should imagine all the Greeks to be standing around them in a circle, as if they were seeing how they might vote and not merely hearing about it), or if people like this are in the neighborhood, or are going to perceive what they are doing. That is also why people, when they suffer bad luck, do not wish to be seen by those who were once feeling jealous of them; for those who feel jealous are admirers. And whenever they have works or things that will bring shame on them, whether their own works or things, those of their ancestors, or certain others with whom they have a sort of close kinship. And, in general, they feel shame before those on whose account they themselves feel shame—these are the ones mentioned and those who refer themselves to them, either those whose teachers or advisors they have been, or if there are others like themselves whose rivals they are; for they are ashamed both to do and not to do many things because of such people. And if they are going to be seen by and go about in public with those who share in the knowledge of [their shameful acts], they are more prone to shame. Hence too what Antiphon the poet said, when about to be flogged to death by order of Dionysius, on seeing that those who were about to die with him covered their faces as they passed through the gate: "Why do you cover your faces?" he said. "Or is it in case some of these people will see you tomorrow?"

These, then, are the things that concern shame; it is clear that from their contraries we will be well equipped with things concerning shamelessness.

155. 1384a22–32.

156. Samos was captured by the Athenians in 356 BC and the reference is probably to a proposed allocation of its land to Athenian citizens.

2.7
Gratitude and Ingratitude

Those toward whom people feel grateful, and on account of which things, and how—by being disposed in the relevant way [they feel it], will be clear after having defined a favor. Let a favor, then, in the sense in which the person who has received it is said to feel grateful, be a service provided to one in need, not in return for anything, nor in order that the provider get something, but in order that the recipient get something. It would be a great one if the person is in desperate need, in need of great and difficult-to-get things, or at times of the correlative sorts, or if the provider is the only one, the first one, or the one who most of all provides it.

Needs are desires and, among desires, especially the ones that involve pain at what is not attained; appetites (for example, love) are such things. And those desires felt in sufferings of the body and in times of danger; for in fact the one who is in danger has an appetite for something and so does the one who is in pain. That is why those who stand by someone in poverty or in exile, even if the services they provide are small, because of the greatness of the need and the opportune time of them, have shown favor—for example, the one who gave the mat in the Lyceum.[157] Necessarily, then, favor especially consists in providing service in these sorts of cases[158] or, if not, in cases of equal or greater need.

So, since it is evident to whom, on account of which things, and by being disposed in which way people feel grateful, it is clear that it is from these that [speakers] should produce feelings of gratitude, proving that some people either are or have been in the relevant sort of pain or need and that others have provided some such service in some such time of need or are providing it.

It is also evident on what basis it is possible to exclude feelings of gratitude and produce feelings of ingratitude; for it might be shown that either the people were providing or had provided a service for their own sake (and this, as we saw, is not a favor), or that it happened by luck, or they were compelled, or that they were returning a favor and not doing one, whether knowingly or not knowingly; for in both cases there would be a return, so that not even in this respect would it be a favor. And it should be investigated in relation to all the categories; for a favor is a favor either because it is this particular thing, or because of its quantity, quality, time, or place. And it is a sign [of there being no favor] if a small service is not provided or if the same, equal, or greater services are provided to enemies; for it is clear that in neither case are these for our sake. Or if someone has provided a worthless service and knows it; for no one agrees to having a need for worthless things.

157. Nothing is known about this.
158. Reading εἰς τοιαῦτα.

About feeling gratitude and feeling ingratitude, then, let this much be said. Let us now say what sorts of things are pitiable, whom people pity, and by being disposed in which way they feel it.

2.8
Pity

Let pity, then, be a sort of pain at an apparently destructive or painful bad thing happening to someone who does not deserve it, and one that a person might expect himself too or one of his own to suffer, and this when it appears close at hand; for it is clear that the person who is going to feel pity must actually be such as to think that he, or one of his own, might suffer some such bad thing as is mentioned in the definition, or one like it or much the same as it. That is why neither those who are totally ruined feel pity (for they think there is nothing for them yet to suffer; for they have suffered [everything]) nor those who think themselves to be extremely happy—they instead are wantonly aggressive; for if they think that all goods are actually theirs, it is clear that they think it not possible for them to suffer any evil; for in fact this is one of the goods.

The sort of people who think they might suffer [something bad] are those who have already suffered and escaped, older people (because of both their practical wisdom and their experience), weak ones, those who are rather more cowardly, and those who are well educated; for they rationally calculate well. And those who have parents, children, or wives; for these belong to them and are able to suffer the things mentioned. And those who are neither in a courageous state of feeling, such as anger or confidence (for these feelings do not rationally calculate about future things), nor in a wantonly aggressive condition (for these people too do not rationally calculate about suffering anything), nor, conversely, feeling intense fear (for those who are driven out of their minds with fear do not feel pity, due to being taken up with their own suffering). Instead, it is [only] those who are intermediate between these who feel pity. As they do if they think that certain people are among the decent ones (for the one who thinks that no one is decent will think that all are worthy of something bad). And in general, then, someone feels pity when he is so disposed that he remembers things like this happening to himself or to his own, or expects them to happen to himself or to his own.

By being disposed in which way people feel pity, then, has now been stated; and the things they pity are clear from the definition; for whichever painful or distressing things are destructive[159] are all pitiable, and whichever ones are ruinous, and whichever evils having magnitude of which luck is the cause. The distressing and destructive ones are the various sorts of death, assaults on the body, ill-treatment, old age, diseases, and lack of nourishment. The evils that luck is the cause of are friendlessness, fewness of friends (which is why it is a pity to be torn away from

159. Reading φθαρτικά.

friends and the people one is accustomed to), ugliness, weakness, disablement. And it is pitiable for something bad to come about from what something good should have come. And for this to happen often. And for something good to come about after a person has suffered, as when the gifts from the king were sent to Diopeithes after he had died. And it is pitiable either for nothing good whatever to have come about [for someone], or for there to be no indulgence in it. These, then, and things like them are the ones people pity.

[As for the people they pity,] they pity those they know, provided they are not too closely related to them (if they are, they feel for them as they do about their own future sufferings). That is why Amasis,[160] so it is said, did not weep when his son was led to execution, but did weep when he saw his friend begging; for the latter was pitiable, the former dreadful; for the dreadful is distinct from the pitiable and tends to drive out pity, and is often useful to the opponent; for people no longer pity when something dreadful is close to themselves. And people pity those who are like themselves in stage of life, character, state, position, or birth; for in all these cases it appears more likely that what happens to them may happen to the person himself as well; for, in general, one should suppose here too that the things people fear for themselves are the ones they pity when they are happening to others. And since sufferings are pitiable when they appear close at hand, and since people do not feel pity either at all, or not to the same degree, at things ten thousand years in the past or future (for they neither expect nor remember them), necessarily those who contribute to the effect by their gestures, voice, dress, and, in general, by their dramatic manner are more pitiable (for they make the evil appear close at hand by setting it before our eyes either as something about to happen or as something that has happened). And things that have just happened or are going to happen soon are more pitiable. That is why signs and actions[161] are pitiable too—for example, the clothes of those who have suffered and any things of that sort, and the words and any things of that sort of those who are in the midst of suffering, for example, of those on the very point of death—are pitiable, and especially so when those involved in such situations are excellent people; for all such things, through appearing close at hand, produce more pity, both because the suffering is of someone who does not deserve it and because it is appearing before our eyes.

2.9
Indignation

But most opposed to feeling pity is what people call "being indignant." For being pained at undeservedly doing badly is, in a way, opposed to, and due to the same character as, being pained at undeservedly doing well. And both feelings belong to a

160. Herodotus 3.14 tells this story about Psammetichus III (king of Egypt c. 525 BC), son of Amasis.

161. Reading καὶ τὰς πράξεις.

good character; for one should grieve together with and feel pity for those who undeservedly do badly, but feel indignation at those who undeservedly do well; for what happens contrary to what is deserved is unjust, which is why we ascribe indignation even to the gods.

It might seem that envy is also opposed to feeling pity in the same way, as being of the same kind—even the same thing—as indignation; but it is a distinct thing; for though envy too is a disturbing pain and is directed at doing well, it is not at someone undeserving of it, but at an equal and a similar. And what must be present alike in each and every instance [of envy and indignation] is that [the painful disturbance] not be because something distinct will accrue to the person himself, but because of his neighbor himself; for it will be neither envy nor indignation but rather fear if the pain and the disturbance are present because something base will happen to the person himself because of the other's doing well.

And it is evident that contrary feelings will follow along with these; for the one who is pained at people undeservedly doing badly will be pleased or not pained by their doing badly in the contrary way—for example, no good person would be pained at parricides and bloodthirsty murderers when they are punished; for one should rejoice in such cases, as in the case of those who deservedly do well; for both are just things that make a decent person rejoice; for he must expect that the very things that have happened to someone like him will happen to him too. And all these belong to the same character, and the contrary ones to the contrary one; for the same person will be spiteful and envious; for when someone is pained at the acquisition or possession of something, he necessarily rejoices at its privation or destruction. That is why all these tend to prevent pity, though they differ due to the causes mentioned, so that they are all similarly useful in making people not pity someone.

First, then, let us speak about being indignant, whom people are indignant at, on account of which things, and by being disposed in which way they feel it, and after this about the other feelings. And it is evident from what has been said; for if being indignant is being pained at what appears to be undeservedly doing well, it is clear, first, that it is not possible to be indignant at all good things; for if someone is just or courageous or if he will acquire virtue, no one will be indignant at these things (for neither is there pity for the contraries of these), but people are indignant at wealth, capacity, and the like—at, simply speaking, all those things that good people—and those who possess the things that are good by nature (for example, good breeding, noble beauty, and the like)—deserve.

And since what is long established appears to be something close to what is by nature, if two parties have the same good, people are necessarily more indignant at the one who has recently acquired it and is doing well because of it; for the nouveaux riches cause more pain than those whose wealth is long established or through the family. And similarly the ones who hold office, have capacity, have

many friends, have good children, or anything like that. And if some other good comes to them because of these things, it is the same way; for in fact in this case too the nouveaux riches cause more pain than do those whose wealth is long established when they hold office because of their wealth. And similarly in the other cases. And the cause of this is that what the latter have seems to be their own, while what the former have does not; for what appears always to be that way seems real and true, with the result that the others seem not to have what is their own. And since each good thing is not deserved by any random person, but rather there is a sort of proportion and fit involved (for example, noble weapons are fitting not for the just person but for the courageous one, and distinguished marriages are fitting not for the nouveaux riches but for the well-bred), it follows that if a good person gets what is not fitting, it is a cause of indignation. Also, for an inferior person to dispute with a superior one, especially when they are involved in one and the same matter—hence too this has been said:

> But he avoided doing battle with Ajax, son of Telemon,
> For Zeus was indignant with him when he fought with a better man.[162]

But if it is not the same, even if it is in any way whatever that an inferior person disputes with a superior one—for example, if a musician does so with a just person (for justice is better than music)—it is a cause of indignation. **1387^{b}1**

Whom people are indignant at, then, and why, is clear from this; for they are the ones mentioned and those like them. And people tend to be indignant, [first,] if they deserve great goods and have acquired them; for it is not just that those not like them should have been thought worthy of goods like theirs. Second, if they happen to be good and excellent; for they judge well and hate unjust things. Also, if they are ambitious and desirous of certain things, and especially if they are ambitious for things that others, who happen to be unworthy of them, have obtained. And, in general, those who think themselves worthy of things of which they think others unworthy tend to be indignant at the latter and about these things. That is why the slavish, the base, and the unambitious do not tend to be indignant; for there is nothing they think themselves to be worthy of.

It is evident from these considerations what sort of people those are at whose being unfortunate, doing badly, and not succeeding one should rejoice or not be pained; for these opposites are clear from what has been said. So if the speech makes the judges be of this sort, and proves that those who think they deserve to be pitied, and to be pitied for certain things, do not deserve it, or deserve not to get it, it will be impossible to pity them.

162. The first line is Homer, *Iliad* 11.542; the second is not in our text.

2.10
Envy

And it is also clear on account of which things people envy, whom they do, and by being disposed in which way, if indeed envy is a sort of pain at apparent doing well in terms of the goods mentioned, on the part of those like themselves, not in order that something accrue to the person himself, but because of those [possessing it]; for the sort of people who feel envy are those who have equals, or appear to themselves to have them (and by "equals" I mean equal in terms of birth, familial relationship, stage of life, state, reputation, possessions). Also, those who fall just short of having everything. That is why those who do great things and those who are successful are envious; for they think that everyone is taking what is [rightfully] theirs. Also, those who are exceptionally honored for something, and especially for theoretical wisdom or happiness. And the ambitious are more envious than the unambitious. And the seemingly wise; for they are ambitious for wisdom. And, in general, those who are lovers of reputation concerning something are envious concerning it. Also, the small-souled; for all things seem great to them.

The good things on account of which people are envious have already been stated; for the works and possessions that make people lovers of reputation and for which they are ambitious and desire a reputation, as well as whatever things are matters of good luck, are all pretty much objects of envy, and especially the ones that they themselves desire or think they should have, or things whose possession makes them slightly superior or slightly inferior. And whom people envy is also evident; for these have just now been stated; for they envy those close to them in time, space, stage of life, and reputation—hence it has been said, "For what is the same in kind also knows how to envy."[163] And people envy those they rival; for they rival those mentioned, while no one rivals people who lived ten thousand years ago, those of the future, or those who are dead,[164] or those who live at the Pillars of Heracles, or those that they or others think are far inferior or far superior. And in the same way those concerned with the same things. And since people are ambitious for success in relation to their competitors, their rivals in love, and, in general, those who are pursuing the same things, they are necessarily most envious of these—which is why it is said [that they are like] "potter versus potter."[165] And they are envious of those whose past acquisitions or present successes are a reproach to them, and those are, again, the ones that are close at hand and like them; for it is clear that it is because of themselves that they did not attain the [relevant] good, so that this failure, being painful, produces envy. Also, [they are envious] of those who have or have acquired what is fittingly theirs or which they once possessed, which is why the older envy the younger. And those who

163. Aeschylus, Fr. 305 Nauck. Reading ὅθεν εἴρηται . . . ἐπίσταται.
164. Reading ἢ τεθνεῶτας.
165. Hesiod, *Works and Days* 25. Also 1381b16–17.

have spent much money envy those who have spent little on the same thing. And those who acquired something with difficulty or did not acquire it at all envy those who got it quickly.

And it also clear the things on account of which and what people envious ones rejoice at and by being disposed in which way; for the way by being disposed in which people are pained is also the way by being disposed in which they are pleased at the contrary things. So if [the audience] has been made to be disposed in this way, and if people of the sort described have thought themselves deserving to be pitied or to attain some good, it is clear that they will not attain pity from those with the controlling vote.

2.11
Jealousy

By being disposed in which way people feel jealous and for what sorts of things, and toward what sorts of people is clear from the following; for if jealousy is a sort of pain at the apparent presence, in the case of others who are by nature like the person himself, of good things that are honored and possible for someone to acquire, not due to the fact that another has them but rather due to the fact that he himself does not have them too (and that is why jealousy is a decent thing characteristic of decent people, while envy is a base one and characteristic of base ones; for the decent person, because of jealousy, is setting himself up to attain the good things, while the base one, because of envy, is setting his neighbor up not to have them), necessarily, then, those people are jealous who think themselves worthy of good things they do not have; {for no one thinks himself worthy of things that appear to be impossible.}[166] That is why young people and great-souled ones are like this. Also, those who possess such goods as are worthy of honorable men, and these are wealth, many friends, offices, and the like; for on the supposition that it is fitting for them to be good people, they are jealous of such goods, because such goods are fitting[167] for those who are good. And those whom others think worthy of such goods. And they are inclined to be jealous of anything for which their ancestors, relatives, households, nation, or city are honored; for they think that such things are properly theirs and that they are worthy of them.

But if the objects of jealousy are the honored goods, the virtues are necessarily such, and whatever is beneficial or beneficent to others; for people honor those who are benefactors as well as those who are good. Also, whatever goods are for the indulgence of neighbors—for example, wealth and noble beauty rather than health.

Whom people are jealous of is also evident; for the people we are jealous of are the ones who have acquired these things and others of the same sort (and these are

166. Probably out of place.
167. Reading ὅτι προσήκει.

the things mentioned, such as courage, theoretical wisdom, and office—for officials have the capacity to do good things for many people): generals, orators, and all who possess such capacities. And those whom many wish to be like, or many of their acquaintances, or many of their friends, or those whom many admire, or whom they themselves admire. Also, those whose praises and encomia are sung by poets or professional speechwriters.

And people despise the contraries of these; for despising is the contrary of jealousy, and to despise someone is the contrary of being jealous of him. And those who are so disposed that they are jealous of others or others are jealous of them are inclined to despise those who have the bad contraries of the goods that people are jealous of, and to do so because of these. That is why they often despise those who are fortunate, whenever luck comes to them but without their having the good things that are honored.

The things by which the feelings may be aroused or dissolved, and from which the means of persuasion concerning them come about, have now been stated.

2.12
The Character of Young People

Next let us discuss people's characters, that is, of what sorts people are with regard to their feelings and states, as well as with regard to their stages of life and luck. By "feelings" I mean anger, appetite, and the like, about which we spoke previously, and by "states" I mean virtues and vices, which have also been spoken about previously,[168] as well as the sorts of things that each deliberately chooses, and the sorts that each is prone to do in action. The stages of life are youth, prime, and old age. By "luck" I **1389a1** mean good breeding, wealth, capacities, and their contraries, and, in general, good luck and bad luck.

The young, with regard to their character, are inclined to be appetitive and such as to do whatever they have an appetite for. And of the appetites of the body they are especially inclined to follow the one relating to sexual pleasures, and they lack self-control concerning it. And they are changeable and fickle in their appetites, and though their appetites are intense they are quickly over; for their wishes are sharp but not strong, like the thirst and hunger of the sick. And they are inclined to be spirited and quick-tempered and apt to follow their anger. And they are unable to resist their spirit; for because of their love of honor they cannot bear to be treated with contempt, but become vexed if they think they are being done an injustice. And though they are lovers of honor, they are lovers of victory more; for youth has an appetite for superiority, and victory is a sort of superiority. And they are both of these more than they are lovers of money. In fact they, least of all, are lovers of money

168. 2.2–11.

because they have not yet experienced need, as the pithy remark of Pittacus about Amphiaraus puts it.

And they are not cynical but foolish, because of not yet having seen much wickedness. And they are trusting, because of not yet having been much deceived. And they are hopeful; for like those drinking wine the young are warmed through and through by their nature; and because, at the same time too, they have not yet experienced much failure. And they mostly live by hope; for hope is of something future, memory of something past; and for the young the future is long, while the past is short—for in our early days nothing can be remembered but we can hope for everything. And they are easily deceived because of what was said; for they are easily hopeful. And they are more courageous [than the other two age groups]; for they are spirited and hopeful, the former of which makes them unafraid, the latter confident; for no one is afraid when he is angry, and to hope for something good is a source of confidence. And they are prone to shame; for they do not yet grasp other aspects of nobility, but have been well educated by the laws alone.

And they are great-souled; for they have not yet been humbled by life, but lack experience of its necessities; and to think oneself worthy of great things is greatness of soul, and this is characteristic of a hopeful person. And they choose to do noble things more than advantageous ones; for they live more by character than by rational calculation, and rational calculation has to do with what is advantageous, virtue with what is noble. And they love friends and love companions more than do people at the other stages of life, because they enjoy living with others and as yet judge nothing by reference to advantage, so that they do not judge friends that way either. **1389**[b]**1**

And all the errors they make are in the direction of being more and more intensely contrary to the maxim of Chilon; for they do everything too much; for they love too much, hate too much, and similarly all the others. And they think they know everything and confidently affirm things; for this is the cause of their doing everything too much. And the unjust actions they commit are from wanton aggression, not malice. And they are inclined to pity because of supposing everyone to be good or better than they in fact are; for they measure their neighbors by their own non-vice, and so suppose them to be suffering undeservedly. And they love laughter, which is why they are witty; for wit is well-educated wanton aggression.

Such, then, is the character of the young.

2.13
The Character of Old People

People who are older and pretty much past their prime have characters that are composed mostly of things that are contrary to those [in the characters of young people]; for, because they have lived for many years, have been more often deceived, have made more errors themselves, and because [they think that] most things are

bad, not only do they affirm nothing with assurance but everything with far less assurance[169] than they should. And they think things but know nothing. And being ambivalent, they always add "perhaps" and "maybe," and state everything that way, but nothing firmly.

And they are cynical; for cynicism consists in taking everything in the worst way. Further, they are suspicious because they lack trust, and lack trust because of their experience. And, because of these things, they neither love nor hate intensely but, following the advice of Bias,[170] love as if they would one day hate and hate as if they would one day love. And they are small-souled because of having been humbled by life (or they have an appetite for nothing grand or unusual but rather for things that are related to life). And they are ungenerous; for one of the necessities is wealth, and at the same time they know from experience that it is difficult to acquire and easy to lose. And they are cowardly and fearful about everything ahead of time; for their disposition is the contrary of that of the young; for they are chilly, while the latter are warm, and so old age has paved the way for cowardice; for in fact fear is a sort of chilling.

And they love life, and all the more so at the end of their days, because their appetite is for what is absent, and also because what they need is what they most have an appetite for. And they love themselves more than they should; for this too is a sort of smallness of soul. And, more than they should, they live with a view to what is advantageous and not to what is noble, because of their self-love; for what is advantageous is good for the individual, while what is noble is unconditionally so. And they are more shameless than prone to shame; for since they do not care equally about what is noble and what is advantageous they are contemptuous of their reputation.

And they expect the worst because of their experience (for most of the things that happen are bad, or at any rate, many things turn out for the worse), and because of their cowardice too. And they live by memory more than by hope; for what is left of life is short, what is past is long, and hope is for the future, memory for what is gone by. This is precisely the cause of their babbling; for they keep talking about things that have happened in the past; for it is by reminiscing that they get pleasure.

And their outbursts of spirit, though sharp, are weak. And while some of their appetites have forsaken them, others are weak, so that they are not appetitive people, or people who are inclined to act in accord with their appetites, but rather in accord with profit. That is why people of this age appear to be inclined to temperance, for their appetites have loosened their hold and they are slaves to profit. And they live more in accord with rational calculation than in accord with their character; for rational calculation has to do with what is advantageous, character with the virtues. And the unjust actions they commit are from malice, not wanton aggression.

169. Reading ἄγαν.

170. 1395a28–29 repeats this advice.

The old too are inclined to pity, but not because of the same thing as the young; for the latter are so because of a love of human beings, while the former are so because of weakness; for they think that all sorts of [bad] things are close at hand for themselves to suffer, and this, as we saw,[171] tends to arouse pity. As a result, they are inclined to be querulous and are neither witty nor lovers of laughter; for an inclination to querulousness is the contrary of a love of laughter.

Such, then, are the characters of the old and the young, and so, since all listeners welcome speeches adapted to, and resembling, their own characters, it is quite clear how speakers in the speeches they employ may appear to be such, both themselves and their speeches.

2.14
The Character of Those in Their Prime

It is evident that those in their prime will be intermediate in character between the other two, minus the excess: neither intensely confident (for a state of this sort is rashness) nor exceedingly fearful, but well-disposed in regard to both; neither trusting everyone nor mistrusting everyone, but rather judging them in accord with truth; neither living with a view only to what is noble nor only to what is advantageous, but with a view to both; and neither with a view to miserliness nor to wastefulness, but to **1390b1** what is fitting. And similarly in regard to spirit and in regard to appetite. And they are temperate accompanied by courage and courageous accompanied by temperance. For in the case of young people and old ones these have been divided; for the young are courageous and intemperate, while the older are temperate and cowardly. To speak in universal terms, whatever benefits youth and age have divided, those in their prime have both of, and whatever the former have an excess or deficiency of, the latter have in due measure and fittingly. The body is in its prime from the age of thirty to thirty-five, the soul at around forty-nine.

About youth, old age, and the prime of life, then, and what sorts of characters each has, let this much be said.

2.15
Good Breeding

Let us speak next about those among the goods that come about by luck due to which characters of a certain sort also result for people. The character that belongs to good breeding means that its possessor is more ambitious; for all people who have something to start with usually add to it, and good breeding is honor that derives

171. 1385b13–19.

from ancestors. Also, [men of such character] are inclined to despise even those who are the equals of their own ancestors, because the same things when they are further back in time rather than close at hand are more honorable and easier to boast about.

Good breeding is in accord with the virtue of the stock, while being true to one's stock is in accord with not being a degeneration from nature. For the most part, precisely this degeneration does not happen to the wellborn, although there are many who are worthless people; for in the generations of men, as in the fruits of the earth, there is a certain yield, and sometimes, when the stock is good, exceptional men are produced for a period of time, and then again later on [after a period of worthless ones]. Naturally clever stock degenerates into rather manic characters[172] (for example, the offspring of Alcibiades and of Dionysius), while steady stock degenerates into stupidity and sluggishness—for example, the offspring of Cimon, of Pericles, and of Socrates.

2.16
Wealth

The sorts of character that wealth is followed along with are on the surface for all to see; for in fact the wealthy are wantonly aggressive and arrogant, since they are affected somewhat by the possession of wealth; for their disposition is the same as if they possessed every good thing; for wealth is something like a standard of value for the other good things, which is why all of them appear to be purchasable by it. And they are luxurious and pretentious people: luxurious, because of their mode of life and their display of prosperity; pretentious and unrefined, because all of them are accustomed to spending their time on what they love and admire, and to thinking that others are emulously jealous of the same things as themselves. At the same time, their being affected in this way makes perfect sense; for there are many who need those who have wealth. Hence too the remark Simonides made about the wise and the rich to the wife of Hiero, when she asked whether it was better to be rich or wise. He replied, "To be rich." "For," he said, "we see the wise spending their time at the doors of the rich." And they think they deserve to rule; for they think they have the things on account of which one is worthy to rule. And, in sum, the character proper to wealth is that of a prosperous person who lacks understanding.

The characters of the nouveaux riches and those with old money differ, however, in that the nouveaux riches have all the vices to a greater degree and in a baser form; for nouveau richesse is, as it were, a lack of educatedness in wealth. And the unjust actions they commit are not malicious ones; rather, some are acts of wanton aggression while others are due to lack of self-control—for example, those that end in assault or adultery.

172. Not elsewhere attested in the examples mentioned.

2.17
Capacity

Similarly, with capacity, most of the characters it is followed along with are pretty much evident; for capacity has some of the same features as wealth, some that are better; for those who have capacity are more ambitious and more manly in character than the rich, because of aiming at all those works that they have the resources and the license to carry out in action because of their capacity. And they are more serious because of being in a supervisory position, compelled to keep an eye on the things related to their capacity. And they are more dignified than severe; for their worth makes them more dignified,[173] which is why they are more measured—dignity being a mild and gracious severity. And if they do unjust actions, they are not doers of small unjust actions, but doers of great unjust actions.

Good luck in its various parts includes the sorts of characters of those just mentioned, for the sorts of good luck that seem to be greatest tend toward these [characters]. And further, good luck makes one able to get more with regard to good children and the goods of the body. Although people are more arrogant and more non-rationally calculating because of good luck, there is one very good character trait that follows along with good luck: that of being lovers of the gods, and of standing in a certain relation to the divine, trusting in gods because of the things that have come about as a result of luck. **1391b1**

About the sorts of character having to do with stages of life and luck, let this much be said. For the contrary sorts are evident from what has been said—for example, the character of the poor, unlucky, or incapable.

2.18
Notions Common to All Kinds of Speeches

{The use of persuasive speeches is in relation to judgment (for about things we know and have already judged there is no further need of argument), and there is judgment even if someone by using a speech in relation to a single individual exhorts or dissuades him—for example, those giving advice or trying to persuade (for a single person is no less a judge; for the one we must persuade is the one who is—one might almost say—unconditionally a judge). And if someone speaks in relation to an opponent, or in relation to a proposed subject, the same is true; for it is necessary to use speech and to refute the contrary arguments in relation to which the speech is made as if they were precisely an opponent. It is the same way with epideictic ones; for the speech is composed in relation to the spectator as if in relation to a judge). In general, however, the only person who is unconditionally a judge is the one who in political

173. Reading σεμνοτέρους.

debates judges the things being inquired about (for he inquires about how things stand with the matters under dispute, and with the ones being deliberated about).}[174]
The characters that are in accord with the constitutions were spoken about earlier[175] in discussing deliberative speeches. So, as a result of all that, how and through what means one should make speeches expressive of character has been determined.

But since, as we saw, there is a different end for each kind of speech, and since with regard to all of them beliefs and premises have been collected from which speakers are to derive their means of persuasion in deliberative, epideictic, and disputatious speeches, and further, since we have also determined from which things it is possible to make speeches expressive of character, it remains to determine the common things;[176] for it is necessary for all [speakers] to in addition make use of the possible and the impossible in their speeches, and for some to try to prove that something will happen, others that it has happened. Further, the question of magnitude is common to all speeches; for all use diminishing and amplifying when deliberating, or when praising or blaming, accusing or defending. When these have been determined, we will try to say what we can about enthymemes in common, and about paradigms, in order that, having added what remains, we may deliver over what was proposed at the start.[177]

Among the common things, amplification most properly belongs to epideictic speeches, as has been said, the past to judicial ones (for past things are what the judgment is about), and the possible and the future to deliberative ones.

2.19
Possible and Impossible; the Past; the Future; Amplifying and Diminishing

First, then, let us speak about possible and impossible. If it is possible for one of the contraries to exist or to have happened, its contrary would also seem to be possible—for example, if it is possible for a person to become healthy, it is also possible for him to become ill; for the same capacity is for contraries, insofar as they are contraries. And if what is similar to another thing is possible, so too is the other thing. And if the more difficult thing is possible, so too is the easier one. And if something can come to be excellent and beautiful, it can also come to be in general; for it is more difficult for a beautiful house to exist than for a house to do so.

Also, if the starting-point of something is possible, so too is its end; for no impossible thing comes to be or starts to come to be—for example, the diagonal [of a rectangle] could not start to be, or be, commensurable. And if the end of something is possible, so too is its starting-point; for all things come to be from a starting-point.

174. Probably out of place.
175. 1.8.
176. I.e., the three common topics (1359a11–26).
177. 1.1–3.

And if what is posterior in substance or in coming to be can come to be, so too can what is prior—for example, if a man can come to be, so also can a boy (for the latter is prior in coming to be), and if a boy can, so too can a man (for a boy is also a starting-point).

Also, that for which there is by nature a love or appetite is possible; for, for the most part, no one loves or has an appetite for impossible things. And where there are sciences or crafts, it is possible for the subjects of these both to be or to come to be. And things are possible when the starting-point of their coming to be lies in things we can compel or persuade—and these are things we are stronger than, things we control, or friends.

Also, if the parts of something are possible, so too is the whole, and if the whole of something is possible, the parts for the most part are as well; for if sole, toe, and upper can be, shoes can also be, and if shoes can, so can sole, toe, and upper. And if the kind as a whole is among the possible things, so too is the form, and if the form is, so too is the kind—for example, if a ship can come to be, so can a trireme, and if a trireme can, so can a ship. And if one of two things that are naturally related to each other can, so can the other—for example, if double, also half, and if half, also double. **1392[b]1**

Also, if it is possible for something to come to be without craft knowledge or preparation, it is more so through craft knowledge and carefulness. Hence Agathon's saying:

> And indeed some things must be done by craft, others
> Accrue to us by necessity or by luck.[178]

And if something is possible for worse, inferior, or less practically wise people, it is more possible for their contraries; thus Isocrates said that it would be strange if he could not find out for himself something that Euthynous had learned [from others].

As for the impossible, it is clear that it comes about from the contraries of the things that have been stated.

The question of whether a thing has or has not happened should be investigated on the basis of the following. First, if what is naturally less disposed to happen has happened, what is more so should also have happened. And if what usually happens as posterior to another thing has happened, then the anterior thing has also happened—for example, if a person has forgotten something, he also once learned it. Also, if a person was capable of something and wished to do it, he has done it; for all people, when they wish something, and are capable of doing it, do it; for there is no impediment. Further, if a person wished to do something, and nothing external prevented him, or if he was capable of doing it and was angry, or if he was capable of doing it and had an appetite for it[, then he has done it]; for, for the most part, people do what they desire to do when they can—the base because of lack of self-control, the decent because the things they have an appetite for are decent. Also, if something was

178. Fr. 8 Nauck.

going to happen, and if a person was going to do something[, then he has done it]; for it is likely that a person who was going to do something also did it.

Also, if whatever by nature happens before a thing, or happens for the sake of it, has happened—for example, if lightning has occurred, so has thunder, and if a person tried to do something, he also did it. And if whatever by nature happens as posterior to a thing, or is what it happens for the sake of, has happened—for example, if thunder has, so has lightning, and if a person did something, he tried to do it. Among all of these, some are so by necessity, some for the most part.

As for what has not happened, it is evident [that it results] from the contraries of the things that have been stated.

And what will be in the future is clear from the same things; for what lies in both [our] capacity and wish will be. Also, those things that lie in [our] appetite, anger, or rational calculation, combined with the capacity to do them, [will be]. And those too that lie in impulse[179] or that are about to be done; for things that are about to be done are for the most part more likely to happen than those that are not about to be done. And if whatever things naturally happen before something have happened—for example, if it is cloudy, it is likely that it will rain. And if what is for the sake of the thing at issue has happened, it is likely that the thing has happened too—for example, if the foundation has been, then a house too.

As for the greatness or smallness of things, the more and the less, and the large and the small generally, they are evident to us from what was stated earlier;[180] for in the discussion of deliberative speeches we spoke about the magnitude of goods and about what is unconditionally larger or smaller. So, since of each sort of speech the proposed end is a good (that is to say, the advantageous, the noble, and the just), it is evident that every speaker must take the materials of amplification from these. But to go further beyond these, and to inquire about unconditional magnitude and superiority, is to argue emptily; for among the things at issue, the particulars are more controlling factors in relation to needs than the universals.

About the possible and the impossible, whether something has happened or has not happened, will or will not be, and further about the largeness or smallness of things at issue, let this much be said.

2.20
Means of Persuasion Common to All Kinds of Speeches

It remains to speak about the means of persuasion that are common to all, since the special ones have been stated. These common means of persuasion are two in form: paradigm and enthymeme; for a maxim is a part of an enthymeme. First, then, let

179. Reading ταῦτα καὶ ἐν ὁρμῇ.
180. 1.7.

us speak about a paradigm; for a paradigm is like an induction, and an induction is a starting-point.

There are two forms of paradigms; for to speak of things that have happened before is one form of paradigm, and to make one yourself is another. And of the latter, one sort is comparison and another fables—for example, the Aesopic and the Lybian.

Speaking of things that have happened before is something such as the following. If someone were to argue: It is necessary to make preparations against the king [of Persia] and not allow Egypt to be subdued; for in fact earlier Darius did not cross over [to Greece] until he had previously taken Egypt, while having taken it, he crossed over; and later Xerxes did not attack, until he had previously taken it, while having **1393ᵇ1** taken it, he invaded; so if the present king takes it, he will invade; that is why it must not be allowed.

Socratic arguments are cases of comparison. For example, if someone were to argue that officials should not be chosen by lot; for that would be like someone choosing athletes by lot—not those capable of competing, but those to whom the lot falls; or like choosing by lot one of the sailors to act as captain, on the grounds that it should be the one to whom the lot falls and not the one with scientific knowledge.

An example of fable is what Steisichorus said about Phalaris, and Aesop about the popular leader. For Steisichorus, when the people of Himera had chosen Phalaris as autocratic general, and were going to give him a bodyguard, after the many other things he said in the discussion, told them the following fable: A horse had a meadow to himself. A stag came along and damaged the pasture. The horse, wishing to avenge himself on the stag, asked a human if he could help him avenge himself on the stag. He said he could, if the horse accepted a bridle and he himself mounted up javelins in hand. When the horse agreed and the human mounted, instead of avenging himself the horse found himself enslaved to the human. "So you too," he said, "should look out, lest in wishing to avenge yourselves on your enemies you suffer the same thing as the horse. You already have on the bridle, having appointed an autocratic general. If you give him a bodyguard and allow him to mount up, from that moment you will already be enslaved to Phalaris."

Aesop, defending a popular leader in Samos who was on trial for his life, said the following: A fox, while crossing a river, was driven into a crevice in the bank and, not being able to get out, was for a long time in sore distress, and many dog-fleas had hold of her. A hedgehog, while wandering about, saw her and feeling a lot of compassion asked her if she would like him to remove the dog-fleas, but she would not allow it. When the hedgehog asked why not, she replied, "Because these are already full of me and draw little blood, but if you remove them, other hungry ones will come and drink the blood that is left to me." "You too, then," Aesop said, "men of Samos will suffer no more harm from this man (for he is rich). But if you put him to death, other poor ones will come, who will steal and squander your public funds." **1394ª1**

Fables are suited to the speeches of public oratory, and have this good feature, that while it is difficult to find similar things that have happened, it is easy with fables; for they should be produced in the same way as comparisons, provided one is capable of seeing similarity, which is precisely what is easy[181] on the basis of philosophy. But though examples that operate through fables are easier to provide, the ones that operate through things that have happened are more useful in deliberation; for future events are for the most part similar to past ones.

A speaker who does not possess enthymemes should use paradigms as demonstrations (for persuasion is through these), while the one who does possess them should use paradigms as witnesses, as supplementary arguments to the enthymemes; for when the paradigms are placed first, they look like an induction, but induction does not properly belong in rhetorical speeches, except in a few instances. As supplementary arguments, though, they look like witnesses, and a witness is persuasive in every context. That is also why, when they are put first, it is necessary to state many of them, although as a supplementary argument even one is enough; for even a single trustworthy witness is sufficient.

How many forms of paradigms there are and how and when they should be used has now been stated.

2.21
Maxims

As for the use of maxims, once it has been stated what a maxim is, it should be most evident about what, when, and for whom it is fitting to make use of maxims in speeches. A maxim is an affirmation, not though about particulars (for example, about what sort of person Iphicrates is), but about universals, and not about all of them (for example, that the straight is contrary to the crooked), but about the things that actions have to do with, and with things that are to be chosen or avoided with a view to doing an action. So, since the [relevant] enthymemes are pretty much a deduction about such things, the conclusions of the enthymemes or their starting-points, the deduction being omitted, are maxims. For example,

> A man naturally of sound mind should never
> Have his children taught to be too wise.[182]

This, then, is a maxim. But if the cause and the why are added, the whole thing is an enthymeme—for example,

> For apart from the various sorts of idleness they face,
> They incur the hostile envy from their fellow citizens.[183]

181. Reading ῥᾷον.
182. Euripides, *Medea* 194–195.
183. Euripides, *Medea* 296–297.

And this: **1394ᵇ1**

> There is no man who is happy in everything.[184]

And this

> There is none among men who is free

is a maxim, although taken with what follows

> For he is a slave either of money or of luck,[185]

it is an enthymeme.

If, then, a maxim is the thing mentioned, there are necessarily four forms of maxims; for the maxim is either with or without a supplementary argument. Those that need a demonstration are those that say something unacceptable or disputable, while those that say nothing unacceptable are without a need for a supplementary argument. Some of these, because of being already known, necessarily need no supplementary argument—for example,

> Being healthy is the best thing for a man, so it seems to me.[186]

(for it appears that way to many people). Others, as soon as they are uttered, are clear to those who look at them carefully—for example,

> No one is a lover who does not love always.[187]

Among those with a supplementary argument, some are part of an enthymeme, as is,

> A man naturally of sound mind should never . . . ,

while others are enthymematic but not part of an enthymeme, and are the very ones that are most popular. These are the ones in which the cause of what is said is made apparent, as it is, for example, in "Being a mortal, one should not hold fast to immortal anger";[188] for to say "Do not hold fast . . ." is a maxim, and the addition "being

184. Euripides, *Stheneboea*, Fr. 661 Nauck.
185. Euripides, *Hecuba* 894–895.
186. Ascribed to Epicharmus (Fr. 262 Kaibel) by some and to Simonides (Fr. 146 Page) by others.
187. Euripides, *Trojan Women* 1051.
188. Source unknown.

a mortal" is the why. Similarly with "A mortal should think mortal not immortal thoughts."[189]

It is evident, then, from what has been said, how many forms of maxims there are and what each sort is fitting for; for about disputed or unacceptable things they should not be without a supplementary argument, but the supplementary argument may be put first and the maxim used as a conclusion—for example, if someone were to say, "As for me, then, since one should neither be the object of envy nor be idle, I say that children should not be educated"—or the maxim may be stated first and the supplementary argument stated after it. About matters that are not unacceptable yet not clear, the why should be added as tersely as possible. In such cases both Laconic apothegms and riddles are fitting—for example, if someone were to say precisely what Steisichorus said to the Locrians, that they should not be wantonly aggressive, lest their cicadas sing from the ground.[190]

The use of maxims is fitting for people who are older in age and about matters a person has experience of, so that to make use of maxims is—like telling stories—unseemly for someone not of such an age, and to make use of maxims about things in which one lacks experience is silly and shows lack of education. Here is a sufficient sign of this: boors are especially fond of coining maxims and ready to show them off.

To speak in universal terms of what is not universal is especially fitting in outrage and indignation, and, in these cases, either at the start or after the demonstration. And one should also use oft-repeated and common maxims, if they are useful; for because they are common, and as everyone agrees, they seem to be correct. For example, it is fitting for someone who is exhorting his troops to face danger without sacrificing to the gods to say "One omen is best, to defend one's fatherland."[191] And, if they are outnumbered, "The War God is impartial."[192] And, if exhorting them to destroy the sons of their enemies even though they have done no injustice, "Foolish is he who having killed the father leaves behind the sons."[193] Further, some proverbs are also maxims—for example, "an Attic neighbor."[194]

One should also use maxims that are contrary to the ones that are public property (by those that are "public property" I mean ones like "know thyself" and "nothing too much"), whenever the speaker's character is likely to be made to appear better, or the maxim to be stated with feeling. An example of a maxim stated with feeling is if someone in anger were to say "It is false that one should know oneself, since, at any

189. Advice, attributed by some to Epicharmus (Fr. 263 Kaibel), that Aristotle himself thinks we should *not* follow (*NE* 1177b31–1178a2).
190. I.e., lest their city be razed to the ground. Also 1412a23.
191. Homer, *Iliad* 12.243.
192. Homer, *Iliad* 18.309.
193. *Cypria* Fr. 31.
194. Probably, in the negative sense, that with a neighbor like the aggressive inhabitants of Attica, one had no need of enemies.

rate, this man,[195] if he had known himself, would never have thought himself worthy to be a general." And his character [would appear] better [if he were to say] "one should not, as people say, love as if one will one day hate, but rather hate as if one will one day love."[196] And one should make one's deliberate choice completely clear by one's wording, or else one should state the cause in a supplementary argument, saying, for example, "One should not love in the way people say, but as if one were always going to love; for the other is characteristic of a traitor"; or this, "The saying does not please me; for the true lover should love as if he were always going to love"; or "'Nothing too much' does not please me either; for one should hate bad people too much."

Maxims have great help to give to speeches and the first is due to the unrefinement **1395^{b}1** of the listeners; for people enjoy it if someone speaking in universal terms hits upon beliefs that they themselves hold about a particular case. What I mean will be clear from the following, as at the same time will be how one should hunt for maxims. A maxim, as has been said, is a universal affirmation, and people enjoy things said in universal terms that they happen to assume beforehand in particular cases—for example, if someone happened to have bad neighbors or bad children, he would welcome someone saying that nothing is worse than having neighbors or that nothing is sillier than begetting children. So one should aim to discover the sorts of things people happen to assume beforehand and then speak in universal terms about these things in the way described.

This, then, is one sort of the use of maxims. And another is stronger; for it makes speeches be expressive of character. And speeches involving character are those in which the deliberate choice is clear, and all maxims make it so, because the one stating the maxim makes evident a universal fact about the objects of deliberate choices. So if the maxims are good, they make the speaker appear to have a good character.

As regards maxims, then, what they are, how many forms of them there are, how they should be used, and what sorts of benefits they have, let this much be said.

2.22
Enthymemes

Let us now speak about enthymemes in universal terms, that is, in what way one should seek them, and after that about the topics; for each of these two is distinct in form.

That the enthymeme is a sort of deduction was stated earlier,[197] and in what way it is a deduction, and in what respect it differs from those in dialectic; for it should not draw its conclusion from far back, nor by necessarily including everything; for the

195. The reference may be to Iphicrates.
196. Also 1389^{b}23–24.
197. 1355^{a}8, 1356^{b}4.

former is not perspicuous because of length, while the latter amounts to babbling, because one says evident things. That is the cause of the uneducated being more persuasive than the well educated in front of crowds of people—as the poets tell us, the uneducated are "more accomplished at speaking before a crowd."[198] For the well educated say the common things and universals, while the uneducated say things on the basis of what they know and things close at hand. So one should not speak on the basis of all the things that seem to be so, but on the basis of the things that seem to be so to definite groups of people—for example, to the judges or to those they approve. And in fact it should be clear that what is said appears so either to all or to most. And one should not only draw the conclusion from what is necessary, but also from what holds for the most part.

First, then, one should grasp that about whatever subject one has to speak or deduce, whether the subject of the deduction is political[199] or anything else whatever, it is necessary to have facts concerning it, either all of them or some of them; for if you have none of these, you will have nothing to draw a conclusion from. I mean, for example, how could we advise the Athenians whether they should go to war or not without knowing what their capacity is, whether naval or infantry or both, and how great it is, and what revenues or friends and enemies they have, further, what wars they have fought and in what way, and other such things? Or praise them, if we did not have [as a fact] the sea battle at Salamis or the battle at Marathon, or what they did for the children of Heracles, or something else of that sort. For all people praise on the basis of noble things that are, or seem to be, facts. Similarly, people blame the Athenians on the basis of the contraries, looking for one that applies to them or seems to—for example, that they enslaved the Greeks and sold into slavery those who had fought with them against the barbarian and gained the prize for valor (the inhabitants of Aegina and Potidaea), and other such things—and whether some other error of this sort is attributed to them. Similarly, those accusing and those defending accuse and defend on the basis of the relevant facts after examining them.

And it makes no difference whether it concerns Athenians or Spartans, human or god; one should do the very same thing; for also in advising Achilles and in praising or blaming him and in accusing or defending him, one must grasp the relevant facts, or what seem to be facts, about him, in order to say on the basis of these, when praising or blaming, if there is anything noble or shameful [in his case], or, when accusing or defending, anything just or unjust, or, when advising, anything advantageous or harmful. And the same is true of any thing at issue whatever—for example, about justice, whether it is good or not good, [one should speak] on the basis of the facts relevant to justice and the good.

So, since it is evident that everyone does indeed demonstrate in this way, whether they deduce in a more exact or in a more loose fashion (for they do not take from

198. Euripides, *Hippolytus* 989.
199. Rejecting the addition of ἐν.

all the facts but from facts relevant to the given case), and since it is clear that it **1396ᵇ1**
is impossible through argument to prove anything in any other way, it is evident
that it is first necessary, as in the *Topics*, to have selected [premises] relevant to the
given case concerning possible points [of discussion] and the ones that are most
opportune. And, as regards things happening on the spur of the moment, one must 5
seek [premises] in the same way, looking not to indefinite things but to the facts
the argument is about, marking off as many facts as possible and the ones closest to
the thing at issue; for the more of the relevant facts are in hand, the easier the proof
is, and the closer they are, the more properly they belong [to the thing at issue] 10
and are less common. By "common facts" I mean, for example, praising Achilles
because he was a human being, because he was one of the demigods, or because he
went on the expedition against Troy; for these apply to many others as well, so that
such a speaker does not praise Achilles any more than Diomedes. Special facts, by
contrast, are ones that apply to no one other than Achilles—for example, having 15
killed Hector, the best of the Trojans, and of Cycnus, who prevented all the Greeks
from disembarking and was invulnerable, and because he was the youngest who
went on the expedition and the one who went without having sworn, and anything
else of this sort.

One way, then, of selecting, the first one, is this: the topical. Let us now speak of 20
the elements of enthymemes. And by "element" and "topic" of an enthymeme I mean
the same thing. But, first, let us say some things that are necessary to say first.
For there are two forms of enthymemes; for one lot are suited to proving that some-
thing is or is not the case, while another lot are refutative, and the difference is like
that in dialectical ones between refutation and deduction.[200] A probative enthymeme 25
draws its conclusion from what is agreed to, while one suited to refuting draws
conclusions that are disagreed with.

The topics concerning each of the forms that are useful and necessary are pretty
much in our possession; for premises concerned with each have been selected, so 30
that the topics on the basis of which enthymemes should be derived concerning
good or bad, noble or shameful, just or unjust, and concerning characters, feel-
ings, and states, which were earlier selected by us[201] in the same way, are already
on hand.

Still, let us now get a grasp on all these in another way—that is, universally—and **1397ᵃ1**
let us speak taking note of the refutative ones and the ones suited to proving, and of
those belonging to apparent enthymemes, which are not really enthymemes, since
they are not even deductions. When these things have been made clear we will make
determinations[202] about refutations and objections, and on what basis one should 5
bring them against enthymemes.

201. 1.4–14, 2.2–17.
202. 2.25.

2.23
Topics for Enthymemes

One topic belonging to probative enthymemes is that based on contraries; for one should look to see if the contrary belongs to the contrary, doing away with it if it does not belong, establishing it if it does—for example, saying that to be temperate is a good thing; for to lack self-control is a harmful one. Or, as in the *Messianicus*: "For if the war is the cause of the present evils, with peace they should be put right." Or—

> For if indeed it is not just even for those
> Who did evil involuntarily to anger us,
> Then it is not fitting for someone who is compelled to do good
> To be shown gratitude for the benefit he conferred.[203]

Or—

> But if indeed, old man, among mortals false speaking
> Is persuasive, you should believe the opposite too,
> That many truths are unpersuasive to mortals.[204]

Another is based on the different inflections of the same word; for it is necessary for them to belong or not belong in the same way [to the subject]—for example, to say that what is just is not good in every respect; for then even the just would also be good [in every respect], while as things stand to be put to death justly is not choiceworthy.

Another is based on correlatives; for if doing something nobly or justly belongs to one of a pair, to have suffered in a correlative way belongs to the other, and if prescribing belongs to one, doing belongs to the other—as, for example, what Diomedon the tax collector said about taxes: "If it is not shameful for you to sell, neither is it shameful for me to buy."[205] And if suffering nobly or justly belongs to one, producing it in a correlative way belongs to the other. But there is in this the possibility of fallacy; for if someone has suffered something justly, he has justly suffered,[206] but perhaps not at your hands. That is why one should look separately to see whether the sufferer suffered deservedly and the producer produced deservedly, and then to make use of whichever fits the case; for sometimes there is disagreement in a case of this sort and nothing prevents a reply like this in the *Alcmeon* of Theodectes: "Did no one of the mortals loathe your mother?" [Alphesiboa asks. And Alcmaeon says] in reply: "But

203. Source unknown.
204. Euripides, *Thyestes*, Fr. 396 Nauck.
205. Greek cities sometimes sold the right to collect taxes to individuals who aimed to profit thereby.
206. Reading δικαίως πέπονθεν.

one should investigate by dividing." And when Alphesiboa asks how, he understands and replies: "They judged that she should die, but not that I should kill her." {Also, the trial of Demosthenes and those who killed Nicanor; for since the jury judged that they had justly killed him, they believed him to have been justly killed. Also, the case of the man killed at Thebes, where the accused demands that a judgment be made as to whether he died justly, on the supposition that it was not unjust to kill someone who died justly.}[207]

Another is based on the more and the less. For example, "If not even the gods know everything, human beings can much less do so"; for this is to say "if something does not belong to what it should more belong to, it is clear that neither does it belong to what it should less belong to." And that someone who beats his father also beats his neighbors follows from "if the less belongs, the more belongs too"; for men beat their fathers less than they beat their neighbors. Or one may argue in this way, if what more belongs does not belong, [what less belongs does not], or if what less belongs does belong, [so does what more belongs], depending on which of the two one needs to prove.

Further, that there is neither more nor less, on the basis of which it was said:

> Your father too is pitiable for having lost his children;
> Is Oeneus, then, not also pitiable for having lost an illustrious offspring?[208]

And that, if Theseus did no injustice, neither did Paris, and if the sons of Tyndareus did none, Paris did none, and if Hector did none to Patroclus, Paris did none to Achilles. And if other craftsmen are not base, neither are philosophers. And if generals are not base because they are often put to death, neither are sophists. And that "if a private individual should care about your reputation, you too should care about that of the Greeks."

Another is based on looking at time—for example, what Iphicrates said in the speech against Harmodius: "If I had asked for a statue when I will accomplish the thing, you would have granted it. Will you not grant it now that I have accomplished it? Do not, therefore, grant when you expect something, and rescind when you have received it." Again, against Thebans [not allowing] Philip to pass through into Attica: "If he had made this request before helping them by moving into Phocis, they would have granted it. It is absurd, then, because he gave up the opportunity and trusted them, that they will not let him pass through now."

Another is based on turning what has been said about oneself against the speaker. But the turn differs, for example, in the *Teucer* and in the argument Iphicrates used against Aristophon. He asked the latter if he would betray the fleet for money. He

207. Perhaps to be read after 1397ᵃ23–27.

208. Perhaps from Antiphon's lost *Meleager* (1399ᵇ26–28). Oeneus was the father of Meleager, who killed Plexippus, the brother of Althaea and wife of Oeneus, and was killed by Althaea in revenge. The lines are thought to be addressed to Althaea by Oeneus.

denied it. And then Iphicrates said, "If you, Aristophon, would not betray it, would I, Iphicrates, do so?" But the opponent must be one who would seem more likely to do injustice; if he is not, it would be ridiculous—for example, if one were to say this to Aristides as accuser. But against the trustworthiness of an accuser [of the former sort, it works well]; for, in general, the accuser wishes to be better than the defendant. This, then, should be refuted. It is universally absurd, however, when someone reproaches others for what he himself does, or would do, or exhorts others to do what he himself does not, or would not, do.

Another is based on definition—for example, of what the daimonic is: Is it not a god or the work of a god? And yet whoever thinks that a work of a god exists must think that gods also exist. And as Iphicrates argued that the best person is the most well-bred one; for even Harmodius and Aristogeiton had nothing well-bred about them until they did something well-bred in action, while he himself was bred more like them: "At any rate, my works are more like those of Harmodius and Aristogeiton than yours are." And, as in the *Paris*,[209] that all would agree that all those who are not moderate are not content with indulging in one [woman's] body. Also, why Socrates said he did not visit Archelaus; for he said that wanton aggression is a matter of not being able to repay equally even when one is treated well, as it also is when one is treated badly. For all these speakers by defining and grasping the what-it-is deduce things about the subject they are talking about.

Another is based on the many ways—as, for example, in the *Topics* concerning "sharp."[210]

Another is based on division—for example, if everyone does injustice for the sake of three things (this, this, or this), and because two of them are impossible in the present case, and because not even the accusers themselves affirm the third. . . .

Another is based on induction—for example, from the case of the woman of Peparethus. [It is argued] that women everywhere determine the truth about the paternity of children; for when the speaker Mantias was disputing in Athens about the paternity of a child, the child's mother made known the truth. Similarly, when Ismenias and Stilbon were disputing in Thebes, the woman of Dodona demonstrated [this when she] identified her son as being the son of Ismenias, and because of this Thettaliscus was acknowledged as Ismenias' son. And, again, from the *Law* speech of Theodectes:[211] "If people do not entrust their own horses to those who have taken bad care of the horses of others, nor their own ships to those who have capsized the ships of others, then, if this is likewise so in all cases, one should not employ for one's own preservation those who have badly guarded the preservation of others." And, as Alcidamas argued, that all honor the wise: "The Parians, at any rate, honored Archilochus although he slandered them; the Chians Homer, although he was not a

209. Of Polycrates.

210. 106a13–17.

211. The speech seems to have been against hiring mercenaries.

citizen; the Mytileneans Sappho, although she was a woman; the Spartans even made Chilon one of their senators although they are least fond of words; and the Italians, Pythagoras;[212] the Lampsacenes buried Anaxagoras, although he was a foreigner, and still honor him even now; {the Athenians were prosperous while they made use of the laws of Solon, and the Spartans those of Lycurgus; and at Thebes, as soon as the leading men became philosophers the city prospered."}[213]

Another is based on a judgment about the same, a similar, or a contrary case, especially when all always [judge in that way]—but if not, at any rate, when most do, or the wise (either all or most of them), or the good, or if these judges themselves do, or those these judges approve, or those one cannot judge contrary to (for example, those with the controlling vote), or those it would not be noble to judge contrary to (for example, the gods, a father, or teachers—as Autocles said against Mixidemides: "It is [a terrible thing] if it was fine for the Dread Goddesses[214] to stand trial before the Areopagus but not for Mixidemides"). Or as Sappho said, that it is bad to die; for the gods have so judged; for otherwise they would die. Or as Aristippus did against Plato when he said something too professorially: "But our companion," he said, "never spoke like that"—meaning Socrates. And at Delphi Agesipolis consulted the god, having previously consulted the oracle at Olympia, as to whether his belief was the very same as his father's, on the supposition that it would be shameful to say contrary things. And as Isocrates wrote about Helen, that she was good, if indeed **1399ᵃ1** Theseus so judged, and about Paris, whom the goddess judged to be better than others; and about Evagoras, that he was excellent, as Isocrates said; at any rate, when Conon suffered bad luck, leaving others aside, he came to Evagoras for help.[215]

Another is based on the parts, as in the *Topics*.[216] What sort of movement is the soul? For it is this or that. There is a paradigm in the *Socrates* of Theodectes: "What holy place has he profaned? Which gods that the city acknowledges did he not honor?"

Another—since in most cases the same thing is followed by good and bad—is to exhort or dissuade, accuse or defend, and praise or blame on the basis of consequences. For example, being educated is followed by being envied, which is a bad thing, while to be wise is good: therefore, one should not be educated, for one should not be envied; or certainly one should be educated, for one should be wise. This topic constitutes the craft of Callippus, with the addition of the possible and the other things that have been mentioned.

Another is when one needs to exhort or dissuade about two things that are opposites, and one needs to use the way[217] mentioned in the previous case in both. But the

216. 111ᵇ5–11.
217. Reading τρόπῳ.

difference is that there random things are opposed, while here they are contraries. For example, a priestess did not allow her son to speak publicly: "For," she said, "if you say what is just, the people will hate you; and if what is unjust, the gods will. Certainly, you should speak publicly; for if you say what is just, the gods will love you; and if what is unjust, people will." This is the same as the saying, "Buying the marsh with the salt."[218] The turning inside out consists in this: when each of two contraries is followed by a good and an evil, [apply] each contrary to each.

Another—since people do not praise the same things openly as they do non-openly, but openly praise the just and the noble most of all, while in private they wish more for what is advantageous—is on the basis of these to try to draw on each; for among the ones that are unacceptable, this topic is the most controlling one.

Another is based on analogical consequences—for example, when they tried to compel his son, who was younger than the required age, to perform public service because he was tall, Iphicrates argued that if they consider tall boys to be men, they should vote that short men are boys. And Theodectes in the *Law* speech argued: "Since you are making citizens of mercenaries, such as Strabax and Charidemus, because of their decency, will you not make exiles of those among the [citizen] mercenaries who have done irreparable harm?"

Another is based on [arguing] that if what results is the same, the things from which it resulted are also the same—for example, Xenophanes said that those who say that the gods are born and those who say that they die are equally impious; for in both cases it results that at some time gods do not exist. And, in general, one should take the result of each of the relevant things as always the same: "You are going to make a judgment not about Isocrates, but about education, as to whether one should study philosophy."[219] And that to give "earth and water"[220] is to be a slave, and that to share in "the common peace" is to do what is commanded.[221] And one should take whichever of the two is useful.

Another is based on the fact that people do not always choose the same thing before as after, but rather the reverse one—for example, the following enthymeme: "When in exile, we fought to return home, but having returned, we are to go into exile in order to avoid fighting!"[222] For at one time they chose to be at home at the cost of fighting, and at another time not to fight at the cost of not being at home.

Another is to say that that for the sake of which something might exist or might have come to be is that for the sake of which it does exist or did come to be—as if someone gave something to someone in order to cause him pain by taking it back. Hence it has been said:

218. I.e., you must take the bad with the good.
219. The reference seems to be to Isocrates, *Antidosis* 170–175.
220. The Persians demanded earth and water as a symbol of submission to their control.
221. Probably the peace forced on Greek cities by Macedon after the battle of Chaeronea in 338 BC, which was not completely ratified until 336.
222. Apparently an adaptation of Lysias 34.11.

It is not out of goodwill that the divine,
Gives great good luck to many, but in order that
The misfortunes they suffer be more evident.[223]

And, from the *Meleager* of Antiphon:

Not in order to kill the beast, but to be witnesses
Of the virtue of Meleager to Greece.

And, from the *Ajax* of Theodectes, that Diomedes deliberately chose Odysseus not in order to honor him, but in order that his companion might be inferior to him; for he could have done it for the sake of this.

Another, common to opponents [in court] and deliberative speakers, is to look to see what the incentives and the disincentives are, and for the sake of what people do things or avoid doing them, and these are the things that, if present, one should do the action, and if not present, then one should not do it. For example, if it is possible, easy, or beneficial either to oneself or to friends, or harmful to enemies, or, if it is punishable, the punishment is less than the thing at issue. And people are given an incentive on the basis of these, and a disincentive on the basis of their contraries. And accusation and defense are based on the same ones: they defend themselves on the basis of the disincentives and accuse on the basis of the incentives. This topic is the whole craft of Pamphilus and Callippus.

Another is based on things that are believed to have occurred but are unpersuasive, because they would not have been believed had they not actually occurred or nearly so—in fact, that they are more likely to have occurred; for people [only] accept things that really exist or that are likely to exist. If, then, something were unpersuasive and not likely, it would be true; for it is not because of being likely or being persuasive that it seems so [but because it is true]. For example, when Androcles of Pitthus spoke against a law, since he was shouted at, he said: "Laws need a law to rectify them, for even fish need salt" (and yet it is neither likely nor persuasive that creatures reared in saltwater would need salt), "and pressed olives need oil" (and yet it is unpersuasive that things from which oil comes need oil).

Another is refutative: looking for inconsistencies, to see whether there is any inconsistency among all the times, actions, or words.[224] First, separately, regarding the opponent [in court]—for example, "And he says he loves you, but he conspired with the Thirty." Next, separately, regarding [the speaker himself]: "And he says that I am litigious, but he cannot demonstrate that I have brought a case to be judged." Next, separately, regarding both the speaker himself and the opponent: "He has never put up any money, but I have ransomed many of you."

223. Source unknown.
224. Slightly rearranging Kassel's text.

Another, for people or things at issue against whom negative prejudices have been, or seem to have been, raised beforehand, is to state the cause of the prejudicial belief; for it must appear so because of something. For example, when a certain woman, who had palmed off her own child as another's, seemed to be the lad's lover because of clinging fondly to him, but when the cause was stated, the accusation was refuted. Another example is in the *Ajax* of Theodectes: Odysseus tells Ajax why, though he is more courageous than Ajax, he does not seem so.

Another is from the cause: if it exists, [arguing] that the effect does, and if it does not, that the effect does not; for the cause and what it is cause of go together, and nothing can exist without a cause. For example, when Leodamas was defending himself against Thrasybulus' charge that his name had been inscribed on a column on the Acropolis,[225] but had been erased in the time of the Thirty. That was not possible, he said; for the Thirty would have trusted him more if his enmity for the people had remained inscribed.

Another is to look to see whether it was possible or is possible for the action that someone advises, or is doing or has done, to be done in a better way; for it is evident that if this is not so,[226] he did not do the action; for no one voluntarily and knowingly deliberately chooses the bad things. But this is [sometimes] false; for often it later becomes clear how things could have been done better, while earlier it was unclear.

Another, when an action is about to be done that is contrary to what has been done, is to look at them together—for example, when the people of Elea asked Xenophanes if they should sacrifice and sing dirges to Leucothea or not, he advised them not to sing dirges if they took her to be a god, and not to sacrifice if they took her to be a human being.

Another topic is to accuse or defend on the basis of errors that have been made. For example, in the *Medea* of Carcinus,[227] some accuse Medea on the grounds that she has killed her children—at any rate, they are nowhere to be seen; for Medea made the error of sending her children away. But she defends herself on the grounds that it is not her children but rather Jason that she would have killed; for she would have made an error in not doing so, if in fact she had done the other thing. This topic and form of enthymeme constituted the whole craft before Theodorus.

Another is from the name—for example, as in Sophocles: "Clearly you are iron as the name you bear."[228] And, as people are accustomed to speak in praises of the gods, or as Conon called Thrasybulus "daring in council (*thrasuboulon*)," or as Herodicus said to Thrasymachus, "You are always daring in battle (*thrasumachos*)," and to Polus, "You are always a colt (*polos*)," and of Draco the legislator that his laws were not those of a human being but of a snake (*drakôn*) (for they were harsh). Also, as Hecuba in Euripides says to Aphrodite: "And rightly does the name of the goddess

225. The names of traitors were so inscribed.
226. Reading εἰ μὴ οὕτως ἔχει.
227. Apparently, in this version, Medea did not kill her children.
228. Fr. 597 Nauck. *Sidêros* means "iron."

start like 'foolishness (*aphrosunês*)'."[229] And as Chaeremon said: "Pentheus, named for his future misfortunes."[230]

Refutative enthymemes are more popular than demonstrative ones because a refutative enthymeme is a bringing together of contraries in a small space, and when these are set side by side they are more evident to the listener. But of all deductions, whether refutative or demonstrative, the most applauded are those of the sort the listeners foresee the moment they start, as long as they are not superficial (for at the same time people are also pleased with themselves for pre-perceiving the conclusion), and those of the sort that they are late in apprehending, so that they know them the moment they are stated.

2.24
Topics for Apparent Enthymemes

Since it is possible for a thing to be a deduction or for another thing not to be one, but to appear to be one, necessarily, it is also possible for a thing to be an enthymeme and for another thing not to be one, but to appear to be one, since indeed an enthymeme is a sort of deduction. And there are topics for apparent enthymemes.

One depends on the mode of expression, and one part of this, just as in dialectical **1401ª1** ones, is when what is ultimately stated, though not deduced, is said in the form of a deductive conclusion: "Therefore, such-and-such is not so," "Therefore, such-and-such must be so." Similarly, in the case of enthymemes, stating something tersely and antithetically makes it appear to be an enthymeme; for a mode of expression of this sort is the province of enthymemes. And that something of this sort seems so depends on the figure of the mode of expression. With regard to speaking deductively in one's mode of expression it is useful to state the crowning points of a number of deductions: "He saved some, avenged others, and freed the Greeks"; for each of these has been demonstrated from other things, but when they are put together something appears to result from them too. The other part is by exploiting homonymy: saying that the mouse (*mus*) is excellent, since from it is derived the most estimable of all festivals; for the Mysteries (*musteria*) is the most estimable festival of all. Or if someone composing an encomium for a dog were to include the Dog Star or Pan in their account, because Pindar said: "O blessed one, whom the Olympians call 'dog,' multifarious, of the Great Goddess." Or to say that to be without a dog is the greatest dishonor, so it is clear that the dog is estimable.[231] Or that Hermes is the most sociable (*koinônikos*) of the gods; for he alone is called "the common (*koinos*)

229. *Trojan Women* 990.

230. The word *penthos* means "misfortune" or "sorrow."

231. The precise meaning is unclear. However, a piece in the game of *poleis*, thought to resemble backgammon, was called a "dog." So that being without a dog would be to have no piece left in the game.

Hermes."[232] Or that speech (*logos*) is the most excellent thing, because good men are worthy of esteem (*logou axioi*), not of money; for the expression *axion logou* is not said of things in a simple way.[233]

Another is for the speaker to combine what is divided or to divide what is combined; for since what is not the same often seems to be the same, whichever is more useful should be done. This is Euthydemus' [kind of] argument—for example, claiming to know that there is a trireme in the Piraeus; for he knew each of the [three] things involved.[234] And claiming of the one knowing the letters that he knows the word; for the word is the same as these. Also, saying that since two doses of something cause illness, one dose is not healthy either: for it would be absurd if two goods equaled one evil. Put this way it is for refutation, but it is for proving in the following one: for two goods do not equal one evil. But the whole topic is fallacious. Again, what Polycrates said in regard to Thrasybulus, that he deposed thirty tyrants; for he combines. Or what is in the *Orestes* of Theodectes; for it is a case of division: "It is just that she who has killed her husband" should die; and for the son to avenge the father; these things, then, have been [justly] done.[235] But perhaps when they are combined, it is no longer just. This would also be one by omission; for it leaves out the by whom.[236]

Another topic is establishing or disestablishing an argument by exaggeration. This is when, without proving that someone did something, one amplifies the thing at issue; for when the accused amplifies it he makes it appear that he has not done the action, or that he has done it, when the accuser amplifies it.[237] There is, then, no enthymeme; for the listener fallaciously reasons that someone has done it, or that he has not done it; but this has not been proved.

Another is based on a sign; for this one too is non-deductive—for example, if someone were to say: "Lovers are advantageous to cities; for the love of Harmodius and Aristogeiton destroyed the tyrant Hipparchus." Or if someone were to say that Dionysius is a thief for he is wicked; for this of course is non-syllogistic; for not every wicked person is a thief, although every thief is wicked.

Another is through what is coincidental—for example, Polycrates says of mice that they helped by gnawing bowstrings.[238] Or if someone were to say that being invited to dinner is the most estimable thing; for Achilles' rage at the Achaeans in

232. If treasure, or anything else of value, chanced to be found, those present cried *koinos Hermês* as a way of claiming a share of the find.
233. *Logos* means both "speech" and "esteem."
234. A slightly more complex version of the argument is given at *SE* 177b12–13.
235. It was just for Clytemnestra to be killed for murdering her husband Agamemnon; it was just for Orestes to avenge the murder of his father Agamemnon; but it was not therefore just for both to happen (since that involves Orestes killing his mother).
236. It is just for Clytemnestra to be killed. But by whom? Theodectes leaves this out, and so commits a fallacy by omission.
237. Reading αὔξῃ.
238. I.e., they helped the Egyptians by gnawing the bowstrings of the invading Assyrians.

Tenedos was because of his not being invited; but he was enraged because he was dishonored, and being dishonored was coincidental to not being invited.

Another is by [affirming] the consequent—for example, in the *Paris*,[239] the argument that Paris was great-souled; for, looking down on social interaction with ordinary people, he passed his time on Mount Ida by himself; for because great-souled people are like this, he too should be believed to be great-souled. And: when someone is well-dressed and wanders around at night, he is an adulterer; for adulterers are like this.[240] The same is true of the fact that in front of temples beggars sing and dance, and that exiles can live wherever they like; for because these things belong to those who seem to be prosperous, the people to whom these things belong might seem to be prosperous too. But there is a difference in how [they belong],[241] which is why this too falls under omission.

Another is by taking a non-cause as a cause—for example, when the thing has happened at the same time as another or after it; for people take the coming-after-something as being because-of-something, and especially political policy makers—for example, as Demades took the policy of Demosthenes to be the cause of all evils; for it is after it that the war came.

Another is by omission of how and when—for example, arguing that Paris took Helen justly; for the choice had been given to her by her father; for presumably it was not given for ever, but for the first time; for a father's control extends indeed to this point. Or if someone were to say that it is wanton aggression to strike free people; for it is not so always, but when someone strikes the first blow unjustly.

Further, as in contentious arguments, an apparent deduction results by taking the unconditionally so and the not unconditionally so, but so in a certain respect—for example, in dialectical arguments, that what is not is (for what is not *is* what is not) and that the unknowable is scientifically knowable (for it is scientifically knowable that the unknowable *is* unknowable)—in rhetorical arguments as well there is an apparent enthymeme by taking the not unconditionally likely but likely in a certain respect. But this latter is not universally likely, as Agathon too says:

> Perhaps one could say that the thing itself is likely;
> To mortals many things happen that are not likely.[242]

For what is contrary to the likely does also occur, so that even what is contrary to the likely is likely. And if this is so, what is not likely will be likely. But not unconditionally so. Instead, as in contentious arguments, not adding with respect to, in

239. Of Polycrates.
240. *SE* 167ᵇ8–12.
241. Beggars sing and dance out of the necessity of getting a handout; exiles live where they like out of the necessity of leaving their homeland; the prosperous do these things because they are free to do them.
242. Fr. 9 Nauck.

relation to, and where, produces sophistry, as does the fact here that the likely is not unconditional but likely in a certain respect.

The craft of Corax is based on this topic; for if a person is not liable to be guilty of the charge (for example, if a physically weak person is accused of assault), he should be acquitted of the charge; for it is not likely; and if he is liable to be guilty (for example, if he is physically strong), [he should be acquitted]; for it is not likely, because it was going to seem likely. And similarly in other cases; for necessarily a person is either liable to be guilty or not liable to be guilty of the charge. Both alternatives appear likely, then, but one is likely, while the other is so not unconditionally but in the way mentioned. And this is "to make the weaker argument the stronger." Hence people were justly disgusted by Protagoras' declaration; for it consists in what is false, not true but apparently likely, and is included in no craft, but in rhetoric and contentious argument.

Enthymemes, both real and apparent, have now been spoken about.

2.25
Refutation

The next thing to be discussed, after what has already been said, is refutation.

It is possible to refute [an enthymeme] either by stating a counter deduction or by bringing an objection. And it is clear that it is possible to produce the stating of a counter-deduction on the basis of the same topics [as a deduction]; for the deductions are based on acceptable beliefs, and many things that seem to be so are contrary to one another. Objections, on the other hand, are brought, as also described in the *Topics*,[243] in four ways: based on itself, on what is similar, on what is contrary, or on what has been judged.

By "from itself" I mean, for example, if the enthymeme were about love as something excellent, the objection is in two ways; for it is possible to make a universal statement and say that all need is bad, or to make a particular one and say that there would be no talk of "Caunian love"[244] if there were not also bad sorts of love.

By from what is contrary: for example, if the enthymeme was that the good man does good to all his friends, [the objection is,] but not even the depraved one does evil to all of his.

Regarding what is similar: for example, if the enthymeme was that those to whom evil is done always hate, [the objection is,] but not even those to whom good is done always love.

243. A division similar to the one here is found at *APr.* 69b38–70a1, but no parallel division is found in the extant *Topics*, although a different fourfold division appears at 161a1–15.

244. A proverbial expression for forbidden love, of the sort between Byblis and her twin brother, Caunus.

The judgments are those of notable men: for example, if someone stated the enthymeme that one should be sympathetically considerate to those who are drunk, for their errors are made in ignorance. The objection is that then Pittacus does not have comprehension; for he would not have legislated greater punishments for someone who commits an error while drunk.

Enthymemes are stated on the basis of four things, and these four are likelihood, paradigm, proof, and sign. Those that are drawn from what either does or seems to hold for the most part are enthymemes based on likelihoods. Those that proceed through induction based on what is like, whether on one case or more than one, whenever a person by grasping the universal deduces the particular cases, are enthymemes through a paradigm. Those through what holds necessarily and always are enthymemes through a proof. And those, whether through a universal or a particular one, that something is so or is not so, are enthymemes through signs. And since this is so, and since what is likely holds not always but for the most part, it is evident that enthymemes of these sorts can be refuted by bringing objections, although the refutation may be an apparent one, and not always true;[245] for the objector does not refute that it is likely, but that it is not necessary. That is also why the defendant rather than the accuser always has the advantage, namely, through this fallacy; for since the accuser demonstrates through likelihoods, and since it is not the same thing to refute by proving that an argument is not likely as by proving that it is not necessary, what holds for the most part is always open to objection; for otherwise it would not hold for the most part, and would not be a likelihood, but would hold always and necessarily. And the judge thinks, when a refutation is made in this way, either that the thing is not likely or that it is not for him to judge, reasoning fallaciously, as we said (for he should not only judge on the basis of what is necessary, but also on the basis of likelihoods; for this is to judge in accord with "the best consideration"[246]). It is not enough, then, to refute by proving that it is not necessary; rather, one should refute by proving that it is not likely. And this will result if the objection rather holds for the most part. And an objection of this sort can be brought in two ways: either by the time or by the things at issue—but in the most controlling way, if by both; for if things are more often thus, this is more likely. **1403ᵃ1**

Both signs and enthymemes stated on the basis of a sign are refutable, even if the things hold, as was said in the first discussions;[247] for that every sign is non-deductive is clear to us from the *Analytics*.[248]

The refutation of enthymemes based on paradigms is the same as that of likelihoods; for if we have one case that is not so, there is a refutation, because the argument is not a necessity, even if more cases on more occasions are otherwise, but

245. Reading ἀεὶ.
246. 1375ᵃ29–30.
247. 1357ᵇ10–14, 17–21.
248. E.g., *APr.* 2.27.

if more cases or more occasions are that way,[249] we should contend that his present one is not like them, or not like them in the relevant way, or at least has some sort of difference.

Proofs and enthymemes based on proofs cannot be refuted as non-deductive (and this too is clear to us from the *Analytics*[250]), and what remains is to prove that the thing claimed does not hold. But if it is evident both that it holds and that there is a proof of it, the argument at once becomes irrefutable; for the demonstration becomes at once evident in all respects.

2.26
Amplifying and Diminishing; Refutative Enthymemes

Amplifying and diminishing are not elements of enthymemes; for I mean the same thing by "element" and "topic"; for an element or topic is something into the province of which many enthymemes fall. But amplifying and diminishing are related to proving that something is great or small, as to proving that it is good or bad, just or unjust, or anything else whatever. All these latter ones are things that deductions and enthymemes are about, so that if no one of these is a topic for enthymemes, neither is amplifying and diminishing.

Nor are refutative enthymemes some one form of enthymemes; for it is clear that one refutes by proving something or by bringing an objection. In the first case they prove the opposite in reply—for example, if he proved that something happened, the other proves that it did not, and if he proved that something did not happen, the other proves that it did. So this is not a difference (for they both use the same [topics]; for to prove that something is not the case or that it is the case, they bring in enthymemes). An objection is not an enthymeme either, but rather, as in the *Topics*, it is to state a belief on the basis of which it will be clear that [the opponent] has not [validly] deduced or that he has assumed something false.

But since there are three things that should be examined in a systematic way about a speech, let this much be said about paradigms, maxims, and enthymemes, and, in general, matters concerning the thought, and the bases on which we are well **1403b1** equipped with these and the ways we refute them. It remains to go through style and arrangement.[251]

249. Reading εἰ καὶ τὰ πλείω ἢ πλεονάκις ἄλλως, ἐὰν δὲ τὰ πλείω καὶ τὰ πλεονάκις οὕτω.

250. Again *APr.* 2.27.

251. This paragraph is repeated in an expanded form at the beginning of 3.1, suggesting that it may have been added to make a connection to a body of material on style and arrangement not intended to be part of the treatise as originally conceived.

BOOK 3

3.1
Style and Delivery

There are three things that should be systematically treated about a speech, first, what the means of persuasion will be based on; second, matters concerning style; and third, matters concerning how the parts of the speech should be arranged. The means of persuasion have already been spoken about and how many things they are based on, that they are based on three, and what sort these are, and why there are only these; for all judges are persuaded either because they themselves are affected in a certain way, or because they take the speakers to have certain qualities, or because something has been demonstrated. And enthymemes too have been spoken about, and the bases on which they should be supplied; for, on the one hand, there are special topics for enthymemes and, on the other, [general] topics. So the next thing to speak about is style; for it is not enough to have things one should say, but also necessary to have a way in which one should say them, and this contributes much to a speech's appearing to have a certain quality.

The first thing to be inquired about in accord with nature was precisely the one that naturally comes first: the basis on which the things at issue themselves have persuasiveness; second is the setting out of these by means of a certain style; and third of these is something the capacity of which is very great, but has not yet been systematically attacked, what has to do with delivery. For in fact delivery was late in making its way even into tragedy and comedy; for at first the poets themselves acted their tragedies. It is clear, then, that there is something of this sort in rhetoric too, as there is in poetics, which is precisely what some others have busied themselves about, among them Glaucon of Teos.

Delivery lies in the voice, and how it should be used in relation to each feeling (that is, sometimes loud, sometimes soft or intermediate), how the tones should be used (that is, high, low, or intermediate), and what rhythms to use in relation to each. For there are three things that such people investigate, which are volume, harmony, and rhythm. And these are pretty much those who win the rewards in competitions. And just as actors nowadays have greater capacity to do so than poets, so it is too in political debates, due to the depravity of the constitutions.

A craft concerned with delivery has not yet been contrived, since even one concerning style was late in emerging. And it seems to be something unrefined, when correctly considered. But since the whole study concerning rhetoric is related to **1404^{a}1** belief, one should pay the requisite attention to delivery, not because it is something correct, but because it is something compulsory, since the just thing, at any rate, is to seek nothing more in a speech than that it neither pain nor gladden; for it is just to contend by means of the things at issue themselves, so that other things, which are

outside the demonstration, are superfluous. Nevertheless, delivery's capacity is great, as has been said, because of the depravity of the listener.

Matters of style, however, are a small necessary part in all teaching; for to speak in one way rather than another does make some difference in relation to making things clear, although not so great a one; on the contrary, all this is appearance, and appeals to the listener, so no one teaches geometry this way.

Whenever style does come up it will do the same thing as the craft of delivery, and some people have tried to say a little about it—for example, Thrasymachus in his *Appeals to Pity*. But what concerns delivery is a natural thing, and largely outside the province of craft, while what concerns style is within the province of craft. That is why, again, those who are capable in it receive rewards, just as orators do for their delivery; for written speeches are stronger due to their style than due to their thought.

It was naturally the poets, then, who first got it going; for names are imitations, and the voice, the most imitative of all our parts, was there to start with. That is why the crafts of rhapsodizing, delivery, and of course others, were set up. And since the poets, though saying something foolish, seemed to acquire their reputation because of the style, a poetic style [of writing] first came about—for example, that of Gorgias. And even now the majority of the uneducated still think that such people discuss things in the most nobly beautiful way. This is not so, however, but rather the style characteristic of speech is distinct from that characteristic of poetry. This is made clear by what happened; for not even the tragic poets still use it in the same way, but just as they changed from tetrameters to iambic meter because, of all the various meters, it is most like [ordinary] speech, so they have also given up using names contrary to ordinary ways of speaking, and the ones with which the first poets ornamented their verses, and which the writers of hexameters still use even now. That is why it is ridiculous to imitate those who themselves no longer use style in that way.

So it is clear that we need not speak in an exact way about whatever matters have to do with style, but only those having to do with what we are discussing. The former is spoken about in the *Poetics*.[252]

3.2
Virtue of Style

Let the matters just discussed be regarded as theoretically grasped, and let virtue of a **1404b1** style be to be perspicuous (for speech is a sort of sign and if it does not make things clear it will not do its work), and neither low nor too elevated, but appropriate; for a poetic style, though presumably not low, is not appropriate for a speech.

In the case of nouns and verbs it is the prevalent ones that make a speech perspicuous, while the other names spoken about in the *Poetics* make it not low but

252. Chapters 20–22. Subsequent references are to these.

ornamented; for to deviate from them gives it an appearance of greater dignity; for people feel the same in relation to style as they do in relation to strangers and fellow citizens. That is why one should give one's ordinary way of speaking an air of unfamiliarity; for people find wondrous what is far away, and what is wondrous is pleasant.

In poetry of all sorts there are many ways of producing this effect, and they are fitting there; for the account is about things and people that are more out of the ordinary. But in prose speech they are much less so, since the subject matter is less so, and since even in poetry it would be inappropriate if a slave or a very young person were to use nobly beautiful language, or if it were used about very minor things.[253] But even in these cases what is appropriate is a matter of lowering or elevating. That is why doing it should be concealed, and one should not seem to speak in an artificial way but in a natural one; for the latter is persuasive, while the former is the contrary; for as with someone setting a trap for them, people resent it, just as they do spiked wines. An example is the effect of Theodorus' voice in comparison to that of other actors; for his seems to be that of the character speaking, while theirs seem alien to it. One conceals well if one composes one's speech by choosing from ordinary ways of speaking. This is precisely what Euripides does, and he first set the example.

A speech is composed of names and verbs, and the forms of names are those we got a theoretical grasp on in the *Poetics*, and of these, exotic names, double ones, and neologisms should be used rarely and on rare occasions (where, we will say later; the why has already been stated: it deviates from what is appropriate in the direction of excess). But what is prevalent, what is in proper form,[254] and metaphor are alone useful in the style characteristic of prose speeches. A sign of this is that these are the only ones that everyone uses; for everyone makes use of metaphors in addition to proper and prevalent words. So it is clear that if one composes a speech well, there will be an air of unfamiliarity to it, its composition will possibly be concealed, and it will be perspicuous. This, we said,[255] is the virtue of rhetorical speech. The sorts of names that are useful to a sophist, by contrast, are homonyms (for it is through these that he argues unfairly), and to a poet, synonyms. By words that are both "prevalent and synonymous" I mean, for example, "go" and "walk" (for these two are both prevalent and synonymous). **1405ᵃ1**

What each of these is, and how many forms of metaphor there are, and that its capacity both in poetry and in speeches is great, has been stated, as was said previously,[256] in the *Poetics*. But in a speech one should lavish more loving attention on them, inasmuch as a speech has fewer resources to assist it than verse. Perspicuity plus pleasantness plus an air of unfamiliarity are most of all possessed by metaphor, and [the use of] metaphor cannot be acquired from anyone else. But the epithets and metaphors

253. Kassel proposes a different structure of clauses but without impact on the meaning.
254. Neither lengthened nor shortened, but having the letters and syllables that properly belong to their prevalent forms.
255. 1404ᵇ1–5.
256. 1404ᵇ28.

used in speaking should be fitting. And this will be based on analogy—otherwise, it will be manifestly inappropriate, because contraries are most evident when set side by side. Instead, one should look to see what is appropriate to an old man as a red cloak is to a young one; for the same clothes are not appropriate to both. And if one wishes to honor, one should take one's metaphor from better things belonging in the same kind, and if to blame, from worse ones. I mean, for example, when the contraries are in the same kind, saying of the one who begs that he "prays," or of the one who prays that he "begs," because both are sorts of solicitation, is a case of doing this. As also is when Iphicrates called Callias a "begging priest" instead of a "torchbearer" and the latter replied that Iphicrates must be uninitiated into the Mysteries himself or he would not have called him a "begging priest" but a "torchbearer"; for both epithets have to do with a god, but one is a term of honor and the other of dishonor. And the one [who called actors] "flatterers of Dionysus," while they call themselves "artists."[257] These epithets are both metaphors, the first of which disparages, while the second does the contrary. Also, pirates call themselves "purveyors" nowadays—which is why one can say that the person who has done an injustice has "made an error," or that the one making an error has "done an injustice," and that a thief either "received" or "carried away." An expression like "holding sway over the oar and landing in Mysia" in Euripides' *Telephus* is inappropriate, because "holding sway" is more elevated than the worth [of what it refers to]— hence, no concealment.

There is an error in syllables too if they are not signs of pleasant voiced sounds. For example, Dionysius the Brazen in his elegies calls poetry "Calliope's screech," because both are voiced sounds; but the metaphor, by [using] meaningless voiced sounds, is bad.[258]

Further, metaphors should not be far-fetched, but rather should be transferred, in the form of names, from things that are of the same kind and same form to what is nameless, so that as soon as the name is uttered it is clear that it is of the same kind—as, for example, in the well-regarded riddle, "I saw a man gluing bronze onto a man using fire"; for the process is nameless, but both are a sort of application. Therefore, the author of the riddle called the application of the cupping instrument "gluing."[259] And, in general, from good riddles it is possible to get decent metaphors; for metaphors imply riddles, so that it is clear that the metaphorical transfer will be a good one.

257. Actors are taken to be devoted to the god Dionysus, as his flatterers by those who disparage them and as skilled in his service by the actors themselves.

258. A screech is a meaningless voiced sound, a poem a meaningful one, so they do not both belong to the same kind, as is required for a good metaphor.

259. The riddle is as follows: I saw a man gluing bronze onto a man using fire. What did I see? Answer: You saw a doctor cupping his patient with a bronze cup, heated in a fire, that draws out blood or other fluids as it cools.

And it should be from nobly beautiful things. And noble beauty in names, as Licymnius says, lies in the voiced sound or in the thing signified, and ugliness is the same way.

Further, and thirdly, there is what refutes the sophistical argument. But it is not, as Bryson said, that nobody uses shameful language if indeed the same thing is signified by saying this word instead of that; for this is false; for one may be more prevalent than another, more like the thing, or more properly belonging to it, by setting the thing at issue before the eyes. Further, this word may not have the same way of signifying as that one, so that on this ground too one must be posited as more nobly beautiful or more shameful than the other; for while both signify what is nobly beautiful or shameful, they do not do so insofar as it is nobly beautiful or insofar as it is shameful, or, if they both do so, one does it more and the other less.

These are the sources from which metaphors may be got: from the nobly beautiful either in regard to voiced sound or to capacity, or to sight or to some other sort of perception. It makes a difference, for example, whether one says "rosy-fingered dawn"[260] rather than "purple-fingered," or still worse, "red-fingered."

In the case of epithets too, the application is made from what is bad or shameful, for example, "mother-slayer," and from what is better, for example, "father-avenger."[261] And Simonides, when the winner in a mule-race offered him a small fee, was unwilling to produce [a celebratory ode], as being disgusted at producing one about "half-asses," but when the winner paid enough, he wrote: "Hail daughters of storm-footed mares."[262] And yet they were daughters of the asses too.

And, again, the same is true of the use of diminutives. The use of diminutives makes both the bad and the good less so, as Aristophanes jibes in the *Babylonians*,[263] when he uses "gold-let" instead of "gold," "cloak-let" instead of "cloak," "abuse-let" instead of "abuse," and "disease-let" instead of "disease."[264] But one should watch closely and carefully observe moderation in both [epithets and diminutives].

3.3
Frozen Effects and Inappropriate Metaphors

Frozen effects, on the other hand, come about in four ways with regard to style: First, in double names—for example, Lycophron's "many-faced heaven of the mighty-summited earth" and "narrow-passaged shore"; or like the name given by Gorgias, "oath-breaking

260. Often found in Homer.
261. The reference is to Orestes, who in killing Clytemnestra became at once a mother-slayer and a father-avenger.
262. Fr. 10 Page. Simonides focuses on their "bad" fathers in calling them "half-asses" and on their "good" mothers in calling them "daughters of storm-footed mares."
263. Fr. 90 Kock.
264. Reading καὶ ἀντὶ νοσήματος.

1406a1 and oath-keeping beggar-mused-flatterers";[265] or like Alcidamas' "his soul filled with wrath and his face growing flame-colored," and he thought their eagerness would be "end-accomplishing," he made the persuasion of his words "end-accomplishing," and the sea bed "indigo-blue." For all these appear poetic because of the doubling. This is one cause of frozenness.

Another one is the use of exotic names, as when Lycophron calls Xerxes a "*pelôron* [hugeous] man" and Sciron a "*sinis* [destroying] man,"[266] and Alcidamas of "*athurma* [toys] in poetry," "the *atasthalian* [wretchedness] of nature," and "*tethêgmenon* [whetted] with the unmixed anger of his thought."

A third lies in the use of epithets that are [too] long, or inopportune, or [too] frequent; for in poetry it is appropriate to say "white milk," but in a speech it is not only less appropriate, but also, if such things are used to excess, it puts it to the test and makes it plain that it is a poetic production. Epithets must of course be used to some extent (for they deviate from what is customary and give the style an air of unfamiliarity), but one should aim at moderation, since otherwise it does greater evil than speaking extemporaneously; for while the latter does not achieve the good, the former does achieve the bad.

That is why Alcidamas' epithets appear frozen; for he uses epithets not as seasonings but as the main course, so frequent, long, and conspicuous are they. For example: not "sweat" but "the moist sweat"; not "to the Isthmian games" but "to the festal assembly of the Isthmian games"; not "laws" but "laws, the kings of cities"; not "by running" but "by a running impulse of the soul"; not "a school of the Muses" but "a school of the Muses inherited from nature"; and "the melancholic meditation of his soul"; the craftsman not of "favor" but of "all-popular favor"; and "household steward of the listeners' pleasure"; and concealed not with "boughs" but with "boughs of wood"; and not he covered his body but "his body's shame"; and "closely imitating (*antimimon*) the soul's appetite (*epithumian*)" (this is at the same time using a double name and an epithet, so the result is a poetic production); and "so extravagant an excess of depravity." That is why, by speaking poetically, people produce, because of inappropriateness, something ridiculous and frozen, and, because of babbling, something lacking in perspicuousness; for when a speaker heaps words on someone who already knows, he dissolves the perspicuousness by casting a shadow over it.

People use the double names when something is nameless and the word is easily put together, as in "pastime (*to chronotribein*)." But if it is overdone, it becomes an entirely poetic production. That is why a style using double names is most useful to
1406b1 dithyrambic poets (for they are noisy); exotic names to epic poets (for the style is

265. B15 DK.

266. *Pelôros* is an archaic—and so in the relevant sense exotic—name, meaning something huge and, hence, appropriate for a monster (*pelôr*). Both Sciron and Sinis were famous robbers. *Sinis* is also an exotic word meaning "destroying."

dignified and self-secure); and metaphor to iambic poets (for they [tragic poets] now use iambics, as was said[267]).

And further, a fourth sort of frozen effect is found in metaphors; for there are also inappropriate metaphors, some because they are ridiculous (for comic poets use metaphors too), some because they are overly dignified and tragic. And, if far-fetched, they lack perspicuousness. For example, Gorgias' "things green and bloodless," or "you have shamefully sown and badly reaped";[268] for these are overly poetic. And as Alcidamas called philosophy "a fortress to the laws,"[269] and the *Odyssey* "a beautiful mirror of human life" and "introducing no such toys to poetry" (for all these are unpersuasive because of what was stated). As for what Gorgias said to the swallow, when she flew down and let fall her droppings on him, it was in the best of tragic styles, since he said, "Shame on you, Philomela." For, though shameful for a maiden, if a bird did it, it was not shameful. He well rebuked her by calling her what she was, then, but not what she is.[270]

3.4
Similes and Metaphors

A simile is also a metaphor; for the difference is small; for when the poet says [of Achilles], "He rushed on like a lion,"[271] it is a simile, when "A lion, he rushed on," it is a metaphor; for because both are courageous, he used a metaphor and called Achilles "a lion"). The simile is useful in a speech too, but on occasion; for it is poetic. And similes are to be got in just the way metaphors are; for they are metaphors, but differing in the way they are stated.

Examples of similes: What Androtion said about Idreus, that he was "similar to mongrels let off the chain"; for as they run to bite, so Idreus, let off his chains, was dangerous. And Theodamus likened Archidamus to a "Euxenus without a scientific knowledge of geometry" (this is by analogy; for Euxenus will then be a geometry-knowing Archidamus). And the one in Plato's *Republic*, that those who strip the dead [of their weapons] are like mongrels who bite at stones but do not attack the throwers;[272] or the one applied to the people, that it is similar to a ship owner who is strong but deaf;[273] or the one applied to the verses of the poets, that they are like those

267. 1404ᵃ29–31. Reading ἡ μεταφορὰ . . . εἴρηται.
268. B16 DK.
269. It is unclear whether philosophy is a fortress (*epiteichisma*) against the laws or a fortress in defense of them.
270. A23 DK. Philomela was transformed into a swallow. By metaphorically transferring her name to an ordinary swallow, Gorgias offends again perspicuousness, since what he says is false of an ordinary swallow, though true of a maiden.
271. Homer, *Iliad* 22.164.
272. 469d–e.
273. 488a–b.

who are in bloom but lack beauty;[274] for when the latter have finished blooming and the former are dissolved into their elements they do not appear the same. And the
1407ᵃ1 one of Pericles about the Samians, that they are like children who take the sop but go on crying;[275] or about the Boeotians, that they are like holm oaks; for the latter are felled by holm oaks, and the Boeotians by fighting each other.[276] And Demosthenes'
5 one about the people, that they are similar to those who get seasick on ships. And the way Democritus likened orators to nurses who swallow the baby's sop and rub his
10 lips with the spit. And the way Antisthenes likened the thin Cephisodotus to incense, because he gives pleasure by wasting away.

All these can be stated either as similes or as metaphors, so it is clear that whichever ones are popular when stated as metaphors will also be similes, and similes are metaphors in need of a ratio. And a metaphor based on an analogy should always
15 be reciprocally applicable to either of the two things of the same kind—for example, if a wine-saucer is the shield of Dionysus, the shield can be fittingly said to be the wine-saucer of Ares.[277]

A speech, then, is composed of these things.

3.5
The Constituents of Good Greek Style

The starting-point of style, however, is to speak correct Greek. This consists in five
20 things: First, the use of connectives, which should be introduced in the natural order of coming before or after each other that some of them require—for example, as *ho men* and *ho egô men* require *de* and *ho de*.[278] And they should be correlatively introduced while the listeners still remember the correlation, and the two should neither be too far apart, nor should [another] connective be introduced before the
25 connective that is necessary; for this is rarely appropriate: "But I, on the one hand (*men*), since (*epei*) he spoke to me, for Cleon came begging and (*te kai*) praying, set out, taking them with me."[279] In cases like this, many connectives are thrown in

274. 601b.
275. Samos was conquered by the Athenians in 440 BC. The sop the Samians received was the establishment there of a democracy instead of an oligarchy.
276. The wood of the holm oak (*Quercus ilex*) is hard and tough and was used in making plow beams and other tools, such as axes, which were then used to cut down other holm oaks.
277. A wine-saucer (*phialê*) is a broad, flat bowl or cup, used for pouring libations and drinking, whose shape makes it like a shield.
278. *Men* ("on the one hand") requires an answering *de* ("on the other hand"). *Egô men* ("I on the one hand") implies a contrast with someone else (*ho de*) on the other.
279. The *men* calls for an answering *de*, which is expected (though it does not appear in the text), with *epei* and *te kai* intervening.

before the correlative one is introduced, and if what is intermediate is too long, it lacks perspicuousness.

In one case, then, good style consists in the use of connectives, while in a second it consists in calling things by their special names and not by encompassing ones.[280]

A third is not to use ambiguities, unless by using them, you deliberately choose to achieve the contrary effect,[281] which is precisely what people do when they have nothing to say, yet pretend to say something; for such people say it in verse, just as Empedocles does; for by much going around in circles it tricks the listeners, and they feel precisely the way that many do about oracles; for when oracles speak ambiguously, they also assent: "Croesus, by crossing the Halys, will dissolve a great empire."[282] And because there is generally less chance of an error, oracles speak of the thing at issue in general terms; for in a game of odd-or-even[283] one is more likely to win by saying "odd" or "even" rather than how many it is, or that "it will be" rather than when, which is why soothsayers never add the when. All these things, then, are alike, and so—except for the sake of the sort of thing we mentioned—should be avoided.

A fourth is to follow Protagoras' division of the kinds of names into masculine, feminine, and neuter; for these too should be introduced correctly: "She (*hê*), having come (*elthousa*) and having spoken (*dialechtheisa*), went away."[284]

A fifth consists in the correct naming of plural and singular: "They, having come, beat me (*hoi d'elthontes etupton me*)."[285]

In general, what is written should be easy to read and easy to speak, which is the same thing. This quality is precisely what the many connectives do not possess, nor the writings that are not easy to punctuate—for example, those of Heraclitus. For to punctuate Heraclitus' writings takes work because it is unclear what word goes with what, the preceding one or the following one; for example, at the start of his written composition he says: "Of this *logos*' being forever do human beings prove to be uncomprehending."[286] For it is unclear which of the two the "forever" goes with.[287] Further, the following produces solecism: not introducing, when you join words, what is appropriate for both—for example, if [you are introducing] sound and color

280. If N_1 is a name special to X, and N_2 is a name that encompasses X (or applies to X and to other things), use N_1 rather than N_2.

281. I.e., obscurity.

282. Croesus took it to mean that he would dissolve the Persian empire; in fact, the empire he dissolved was his own.

283. One player held a certain number of counters hidden in his hand. His opponent had to guess how many they were, or whether the number was odd or even.

284. Participles (*elthousa*, *dialechtheisa*) have genders which here, in agreement with *hê*, are feminine.

285. *Hoi*: masculine plural; *elthontes*: masculine participle agreeing with *hoi*; *etupton*: third-person plural, again agreeing with *hoi*; *me*: accusative singular.

286. B1 DK.

287. Is it of the *logos'* being forever that human beings prove uncomprehending, or is it of the *logos'* being that they prove forever uncomprehending?

"seeing" is not common, while "perceiving" is common. And lack of perspicuousness results if you do not present your thesis beforehand, if you are going to throw in many things in the middle—for example, "I was in fact, after speaking to that man, going blah, blah, blah, to go for a walk," instead of "I was in fact going, after speaking, to go for a walk, then blah, blah, blah happened."

3.6
The Weight of a Style

To the weight of a style, the following things contribute: Using the account instead of the name—for example, not "circle" but "a plane figure that extends equally from the center." To concision, doing the contrary: the name instead of the account. And if something is shameful or inappropriate, if what is shameful is in the account, using the name in speaking, but if it is in the name, using the account. Making things clear by means of metaphors and epithets, while guarding against the poetic. Making the singular plural, precisely as the poets do. They say, though there is only one harbor, "to the Achaean harbors,"[288] and "here are my tablet's many-leaved folds."[289] Not joining two names [under one article], but introducing a single one for each—for example, "the woman, the one that is mine"—and, when speaking concisely, doing the contrary: "the woman of mine." Speaking with a conjunction, and, if speaking concisely, doing the contrary, although without ungrammatical asyndeton—for
1408a1 example, "having walked over and having spoken" and "having walked over, I spoke." The practice of Antimachus is also useful, speaking on the basis of what the thing does not possess, as he does in the case of Teumessos: "There is a windy little hill. . . ."[290] Amplification of this sort can go on without limit. And it is available in the case of good things and bad things that are not possessed, whichever is useful. It is from this too that the poets get names, such as, "string-less and lyre-less music," since they introduce them based on the privations; for this is popular when using proportional metaphors in speaking—for example, saying that the trumpet is "lyre-less music."

3.7
Appropriateness

The style will have appropriateness if it expresses feeling as well as character and is proportional to the underlying things at issue. And it is proportional if it neither

288. F83 Nauck. Source unknown.

289. Euripides, *Iphigenia in Taurus* 727. Iphigenia is referring to her letter, made up of joined leaves—literally, "doors (*thurai*)"—of wood coated with wax.

290. The beginning of a passage from the *Thebais*, which continues to praise the hill by enumerating all the good qualities that do *not* belong to it.

speaks off-handedly about weighty things nor in a dignified way about worthless ones, and if no ornamental epithet is attached to a worthless name. Otherwise, it has the appearance of comedy, like what Cleophon produces; for some of the things he said were like saying "Milady fig (*potnia sukê*)."[291]

Style [appropriately] expresses feeling if, in case of wanton aggression, it is that of an angry person; if, in case of impious or shameful things, it is that of one who is disgusted and reluctant even to speak of them; if, in case of praiseworthy things, admiringly; but if they are pitiable, in a lowly way; and similarly in the other cases. And the proper style too makes the thing at issue persuasive; for the soul draws a false inference as to the truthfulness of the speaker, because, in the case of such things, they are in such a condition that, even if the things at issue are not as the speaker says, they think they are that way. In fact, the listeners always share the feelings of a speaker who speaks with [appropriate] feeling, even if he says nothing. That is why many speakers overwhelm their listeners by shouting.

The sort of proof that is based on signs is also expressive of character, when what is appropriate to each kind and state [of character] follows along with it. By "kind" I mean in accord with stage of life (for example, boy, man, old man), woman or man, Spartan or Thessalian; by "states" I mean the things in accord with which someone is of a certain sort in life; for lives are not of the same sort in accord with every state. If, then, a person speaks using names that also properly belong to a state, he will convey the [relevant] character; for a boorish and a well-educated person would not say the same things or would not say them in the same way.

Listeners' feelings are also affected by expressions that professional speechwriters use immoderately: "who does not know?" "everybody knows"; for a listener agrees out of shame, in order to share in the very thing all the others also do.

Opportune or inopportune use is common to all the forms. And a cure for every excess is the oft-repeated one: the speaker himself should criticize himself beforehand; for something seems true when even the one making the speech does not conceal what he is doing. Further, not using all the proportionalities at the same time; for this way the listener[292] is deceived. I mean, for example, if the names are harsh, the voice, countenance, and the other appropriate things[293] should not also be harsh. Otherwise, what each of them is becomes evident.[294] But if one is used, but not another, the speaker does the same thing, but escapes notice. But if, then, gentle things are said [too] harshly and harsh things [too] gently, it becomes unpersuasive.

Double names, a number of epithets, and especially unfamiliar names are fitting for anyone speaking in a way expressive of feeling; for sympathetic consideration is

291. *Potnia* is a poetic title of honor, used chiefly in addressing females, whether divine or human. A *sukê* is a fig tree, the fruit of which is a *sukon*, which is a vulgar name for a woman's (or a man's) genitals.

292. Reading ὁ ἀκροατής.

293. Reading καὶ τοῖς.

294. Reading ἕκαστον ὅ ἐστιν.

shown to an angry person when saying that an evil is "cosmic-sized" or "gargantuan." And they are also appropriate when the speaker already has hold of the listeners and, by his [words of] praise or blame, anger or love, has produced ecstasies of feeling in them, as Isocrates does at the end of the *Panegyricus*: "fame and name . . ." and "in that they endured . . ."; for people do utter such things when they are in an ecstasy of feeling, so that the listeners, being themselves in a similar condition, are clearly receptive of them. That is why these things are also fitting for poetry; for poetry is god-inspired. They should be used, then, in the way described, or with self-deprecation, as Gorgias did, or as in the *Phaedrus*.[295]

3.8
The Scheme or Rhythm of a Style

The scheme of the style should be neither metrical nor rhythmless; for the former is unpersuasive (for it seems fabricated), and at the same time also diverts attention; for it makes the listener attend to the similar cadence and when it will occur again—just as children anticipate the answer to the herald's, "Whom does the emancipated slave choose as his sponsor?" with "Cleon!"[296] But what is rhythmless is unlimited, while a speech should be limited, although not by meter; for what is unlimited is displeasing and unknowable. All things are limited by number. And the number of the scheme of a style is a rhythm, of which the meters are segments.[297] That is why a speech should have rhythm, but not meter; for then it will be a poem. But its rhythm should not be exactly implemented; and this will be if it is rhythmical only up to a point.

Among the rhythms, the heroic[298] is dignified, but deficient in the harmony suited to speaking.[299] The iambic is the very style of ordinary people (which is why of all the meters it is most used in speaking), while style [in a speech] needs to be dignified and removed from common usage. The trochaic is too much like comic dancing, as is clear from [trochaic] tetrameters; for tetrameter is a dancing rhythm. What remains is the paean, which came into use starting with Thrasymachus, although he and his followers could not state what it was. The paean is a third rhythm,[300] closely connected to those already mentioned; for it has the ratio three to two, while the

295. 234d, 241e.
296. By law an emancipated slave could not plead his own case in court; he needed a citizen sponsor to do it on his behalf. Cleon evidently played this role very often.
297. Reading τμήματα.
298. I.e., dactylic hexameter.
299. Reading σεμνὸς καὶ λεκτικῆς ἁρμονίας δεόμενος.
300. Though the paean is actually the fourth meter mentioned, it represents the third alternative regarding ratio, since iambus and trochee involve the same ratio.

others are one to one or two to one. And one-and-a-half is closely connected to these, and this is what the paean is.[301]

The other rhythms should be avoided because of what we mentioned and because they are metrical, while the paean should be adopted; for it alone of the rhythms mentioned is not a meter, so that it most of all escapes notice. As things stand, however, only one sort of paean is used, both at the start and at the end. But the start should differ from the end. There are two forms of paean that are opposite to each other, of which one is appropriate as a start (as it is in fact used). This is the one that starts with a long syllable, and ends with three short ones: *Dālŏgĕnĕs eite Lukian* ("Delos-born or Lycian") and *khrūsĕŏkŏma Hekate pai Dios* ("golden-haired Archer, son of Zeus"). The other is the contrary, where three short ones start, and a long ends: *mĕtă dĕ gān hŭdată t' ŏkĕănŏn ĕphănĭsĕ nūx* ("After earth and waters, night obscured ocean").[302] This produces an ending; for a short syllable, because of its incompleteness, produces something docked. Instead it should be brought to an abrupt close with a long syllable, and the end clearly marked, not by the scribe nor by a marginal mark,[303] but by the rhythm.

That the style, then, should be rhythmical, not un-rhythmical, and what rhythms make it rhythmical and how they do so, has been stated.

3.9
Continuous versus Compact Style

The style is necessarily either continuous and united by connective, like the preludes in dithyrambs, or compact and like the antistrophes of the ancient poets.

The continuous style is the ancient one; for previously all used it, but nowadays not many do. By "continuous" I mean one that has no intrinsic end, except by the discussion of the thing at issue having been completed. It is displeasing because it is unlimited; for all wish to have the end in view. That is why runners lose their breath and relax when they reach the end; for they do not flag before that because of seeing the limit-point ahead of them. This, then, is the continuous style.

The compact style, by contrast, is the one in periods. And by a "period" I mean a style having an intrinsic starting-point and end-point, and a magnitude easily surveyed as a whole. This is pleasing and easily learned. It is pleasing, because it **1409b1** is contrary to the unlimited one and because the listener always thinks he has got hold of something for himself for at every moment something completed is given to him, while neither to foresee nor get to an end is displeasing. And it is easily learned

301. One and a half is the ratio 3:2, which is the mean ratio between 1:1 (heroic) and 1:2 (iambus) or 2:1 (trochee).

302. All three are attributed to Simonides.

303. In Aristotle's time, written punctuation marks were undeveloped. A mark was added in the margin to indicate, for instance, the change of speaker in a dialog.

because it is easily remembered, and this is so because a periodic style has a number, which is the most easily remembered thing of all. That is why everyone remembers things in verse better than those in prose; for it has a number by which it is measured. And the period should also be completed in thought and not broken off, as in the iambic line: "Calydon is this land, of Pelops' soil . . .";[304] for the division makes it possible to suppose the contrary, as in the case we mentioned, that Calydon is in the Peloponnese.

A period is either divided into clauses or smooth. A style consisting in clauses is completed, divided, and easily uttered in a breath, not by means of [arbitrary] division, but as a whole. A clause is one of the two parts of this. I call a period "smooth" when it has only one clause. And both clauses and periods should be neither truncated nor too long; for a short one often jolts the listener; for when he is still being impelled onward by the measure that he has a defining mark of within himself, if he is pulled up short by the speaker's pausing, he is necessarily made to stumble, as it were, due to the abrupt pause. Those, on the other hand, that are too long make him feel left behind, like walkers who go past the turning-point; for they too leave behind their fellow walkers.[305] Similarly, periods that are too long become a [whole] speech that is like a rambling [dithyrambic] prelude. The result is what Democritus of Chios jibed at in Melanippides, who instead of antistrophes composed [dithyrambic] preludes:

> A man does bad things to himself in doing bad things to another;
> A long dithyrambic prelude does the worst to the composer himself;[306]

for the same applies to those who speak in long clauses. But those that are too short do not turn into a period; thus they drag the listener stumbling along.

A style consisting in clauses is either divided or opposed. An example of a divided one is "I have often admired those who organized assemblies and established athletic contests."[307] It is opposed when in each clause contrary is brought into relation with contrary or when the same [word] is yoked together with the contraries. For example: "They profited both, both those who stayed and those who followed; the latter, for they provided them more than they had at home, and the former, for they left enough behind"—the contraries are staying and following, enough and more.[308] "So both to those needing [to get] things and those wishing to indulge in them . . ." —indulging in and getting are contraries.[309] And further: "It often happens in these circumstances that the practically wise fail and the foolish succeed"; "They were straightaway

304. The opening line of Euripides' *Meleager*.
305. Reading ἀπολείπουσι . . . συμπεριπατοῦντας.
306. A parody of Hesiod, *Works and Days* 265.
307. The opening of Isocrates, *Panegyricus*.
308. *Panegyricus* 35.
309. *Panegyricus* 41.

thought worthy of the prizes of valor, and not much later they took the command of the sea"; "To sail through the land and march through the sea, bridging the Hellespont and digging through Athos"; "And though citizens by nature, by law deprived of the city"; "For though some of them miserably perished, others were shamefully saved"; "Privately using [only] barbarians as household slaves, while communally overlooking their many enslaved allies"; "Either to possess when alive or to bequeath when dead."[310] Also, what someone said against Peitholaus and Lycophron in court: "And these men, though they used to sell you when they were at home, have come to you here to buy you off." For all these do what has been said. And such a style is pleasing, because contraries are better known, and are known more clearly when side by side, and because they are like deductions; for refutation consists in a bringing together of opposites.

Antithesis, then, is of this sort. Equalization (*parisôsis*) is if the clauses are equal [in the number of syllables], and unison (*paromoiôsis*), if each of the two clauses has a similar extremity; but it must have this either at the start or at the end. And at the start it is always found in [similar] names, while at the end it may be found in the last syllable, the inflection of the same name, or the same name. At the start in such cases as: *Agron gar elaben argon par' autou* ("A field he took from him, a fallow field"),[311] and *Dôrêtoi t' epelonto pararrêtoi t' epeessin* ("They were ready to accept gifts and to be persuaded by words").[312] At the end: *Ô[i]êthês an auton ou paidion tetokenai, all' auton paidion gegonenai* ("You would have thought him not to have begotten a child, but to have become a child himself"),[313] and *En pleistais de phrontisi kai en elachistais elpisin* ("In the midst of the greatest cares and smallest hopes"). Inflexions of the same name: *Axios de stathênai chalkous, ouk axios ôn chalkou* ("Worthy of a bronze statue, but not worthy of a bronze coin"). The same name: *Su d' auton kai zônta eleges kakôs kai nun grapheis kakôs* ("When he was alive you spoke badly about him and now you write badly"). The same syllable: *Ti an epathes deinon, ei andr' eides argon*? ("What terrible thing would you have suffered, if you had seen an idle man?") And it is possible for the same clause to have all these at the same time, namely, for the same one to be a case of antithesis, equalization, and similarity of ending. **1410^{b}1**

The starts of periods have been pretty much enumerated in the *Theodectea*. And there are also false antitheses—for example, the one Epicharmus wrote: *Toka men en tênôn egôn ên, toka de para tênois egô* ("At one time I was in their house, at another I was with them.")[314]

310. *Panegyricus* 48, 72, 89, 105, 149, 181, 186.
311. Aristophanes, Fr. 649 Kock.
312. Homer, *Iliad* 9.526.
313. The source of this and the other unattributed quotations that follow is unknown.
314. Fr. 147 Kaibel.

3.10
The Sources of Elegant and Popular Expressions

Since determinations have been made about these things, we must next state the sources of elegant and popular expressions. Well, to produce them is a matter for natural cleverness or training; to explain them, on the other hand, is a matter for this methodical inquiry. Let us say what they are, then, and enumerate them completely, and let the following be for us a starting-point.

To learn easily is in fact by nature pleasant to everyone, and names signify something, so whichever names produce learning in us are pleasantest. Exotic names are unknown, and prevalent ones we [already] know, but metaphor is especially good at producing learning; for when someone says that old age is "stubble,"[315] he produces learning and knowledge through the kind; for both old age and stubble are [in the kind of] things that have finished blooming. The similes of the poets also do the same thing. That is why, if they do it well, they appear elegant. For a simile, as was said earlier,[316] is a metaphor differing in how it is presented. That is why it is less pleasing, because it is longer, and because it does not say that this is that, and so the [listener's] soul does not inquire about it.

Necessarily, then, both in style and in enthymemes, the ones that are elegant are those that produce rapid learning in us. That is why superficial enthymemes are not popular (by "superficial" I mean those that are entirely clear and there is no need to inquire about), and neither are those that are unknown when stated. Instead, the ones that are popular are those of which there is knowledge at the same time as they are stated (even if it did not exist previously), or the thought is apprehended a little later; for then some sort of learning takes place, in the other case neither [sort of learning] takes place. In terms of the thought belonging to what is spoken, then, enthymemes of this sort are popular. In terms of the style, on the other hand, an enthymeme is popular because of its scheme, if it is expressed in an oppositional way (for example, "Considering that the peace common to the others was a war against their own private interests" [317]—where peace is opposed to war), and because of names, if these contain a metaphor, provided it is neither strange (for then it is difficult to comprehend) nor superficial (for then it makes no impression). Further, [it is popular] because of setting things before the eyes; for things should be seen as being done rather than as being in prospect. One should therefore aim at these three things: metaphor, antithesis, activity.

1411a1 Among the four sorts of metaphor, the most popular are those by analogy, as when Pericles said[318] that the youth killed in the war vanished from the city as if the spring

315. Homer, *Odyssey* 14.214.
316. 1406b20–22.
317. Isocrates, *Philippus* 73.
318. 1365a31–33.

had been taken from the year. Leptines,[319] speaking about the Spartans, said that he would not allow [the Athenians] to look on while Greece "became one-eyed." And when Chares was eager to have his accounts for the Olynthian war inspected, Cephisodotus indignantly exclaimed that he was trying to have his accounts inspected while "squeezing the people's throat." And once, exhorting the Athenians, he said that they should march out to Euboea, and there provide themselves with supplies "by the decree of Miltiades."[320]

When the Athenians had made a truce with the Epidaurus and the neighboring coasts, Iphicrates, indignant, said that "they had stripped themselves of travel provisions for the war."[321] Peitholaus called the Paralian "the people's bludgeon" and Sestus "the corn seller's board of the Piraeus." Pericles urged the removal of Aegina, "the eyesore of the Piraeus."

Moerocles said that he was no more wicked than X (naming one of the decent people); for that person was wicked at thirty-three and a third percent interest, he himself at ten. Anaxandrides' iambic line about the daughters who were slow in marrying: "The maidens, I find, are past their marriages' due date."[322] That of Polyeuctus to a certain Speusippus, who was a paralytic, that he could not keep quiet, though "shackled by luck in a five-holed pillory of disease."[323] Cephisodotus called triremes "multi-colored millstones," and the Cynic called taverns the "communal messes of Attica."

Aesion said that the Athenians had "drained" their city into Sicily; for this is a metaphor and sets things before the eyes.[324] And his "So Greece cried aloud" is also, in a way, a metaphor and sets things before the eyes. Cephisodotus urged the Athenians not to hold their "race meetings" too often. And Isocrates spoke of those who "race together" in the general assemblies. And the example in the funeral oration, that "it is fitting for Greece to cut off her hair [in mourning] beside the tomb of those who died at Salamis, since together with their virtue freedom was buried";[325] for if the speaker had said that it was proper to shed tears since their virtue was being buried together with them, it would have been a metaphor and set things before the eyes, but "with virtue freedom" involves a certain antithesis.[326]

319. Sparta is one of the eyes, Athens the other.
320. Issued at the time of the Persian invasion of 390 BC, proverbial for the speed with which it was carried out.
321. Against Sparta, in which Iphicrates scored a significant victory in 390 BC. Epidaurus, which prior to the truce had been allied with Sparta, could easily have been plundered by the Athenian navy to provide provisions.
322. Fr. 68 Kock.
323. The head went in one hole, the hands and feet in the other four.
324. The Athenian forces sent to invade Sicily in 415–413 BC were so enormous that they left scarcely anyone behind in Athens.
325. Lysias 2.60. The original refers to the battle of Aegospotami (405 BC), in which the Spartans defeated the Athenians, not Salamis (480 BC), in which the Greeks defeated the Persians.
326. The antithesis is not between freedom and virtue but between freedom and buried.

1411ᵇ1 And when Iphicrates said "the route of my words is through the middle of Chares' actions," it was a metaphor by analogy, and "through the middle of" sets things before the eyes. To say "summoning dangers to help with dangers"[327] is a setting before the eyes and a metaphor. Lycoleon said in defense of Chabrias, "They did not even feel shame before his supplicant—the bronze statue [over there]"; for this was a metaphor at that time, but not at all time, although it set things before the eyes; for when Chabrias was in danger, the statue—the inanimate yet animate memorial of his works for the city—supplicated.

And "in every way practicing smallness of thought"; for to practice is to increase something.[328] That "the god kindled the understanding as a light in the soul"; for both understanding and light make something clear.[329] "For we are not putting an end to our wars, but rather postponing them";[330] for both postponing and a peace of this sort are future things. That "treaties are a much nobler trophy than those that come about in wars; for the latter concern small gains and a single stroke of luck, while treaties concern the whole war"; for both treaties and trophies are signs of victory.[331] And that "cities pay a heavy inspection-based fine with the blame of people"; for an inspection-based fine is a sort of legal blame.[332]

That elegant expressions are based on metaphors by analogy, then, and on setting things before the eyes has been stated.

3.11
Setting Things before the Eyes

We must now state what we mean by setting things before the eyes and what must be done for this to come about. I mean, then, that things are set before the eyes by whatever signifies them being active—for example, to say that a good man is "foursquare"[333] is a metaphor (for both are complete things), but it does not signify activity, while "having his prime of life in full bloom"[334] does signify activity, as does

327. Author unknown. The metaphor lies in the transfer of "summoning" from people to impersonal dangers.
328. Isocrates, *Panegyricus* 151. The subject's smallness of soul may have been increasing, but he was not practicing it with that end in view. Thus as increasing is to X so practicing is to smallness of soul.
329. Source unknown.
330. Isocrates, *Panegyricus* 172.
331. Based on Isocrates, *Panegyricus* 180.
332. The metaphor transfers "inspection" from its proper legal setting to a more general non-legal one.
333. Simonides Fr. 37 Page.
334. Isocrates, *Philippus* 10.

"you, like a sacred animal roaming at will"[335] and "thereupon, the Greeks darting forward with their feet."[336] "Darting" signifies activity and is a metaphor; for it means "quickly." And Homer often used setting before the eyes so as to make inanimate things animate through metaphor. But in all of them it is by producing activity that he wins popularity, as, for example, in the following: "Downward again to the plain rolled the ruthless stone," and, "the arrow flew," and, "[the arrow] was eager to fly," and, "[the spears] stuck in the ground, still longing to take their fill of flesh," and, **1412ᵃ1** "the spear-point sped eagerly through his breast."[337] In all of these, because the things are [signified as] animate, there is an appearance of their being active; for "being ruthless," "longing," and the others signify activity. And these he has applied to the things through a metaphor by analogy; for as the stone is to Sisyphus, so is the shameless person to the one shamefully treated.

Homer does the same to inanimate things in his most popular similes as well: "Arched, foam-crested, in ranks, one upon another."[338] He makes everything into something that moves and lives, and activity is movement.

Metaphors, as was said earlier,[339] should be drawn from things that are closely related but not manifestly so—as even in philosophy getting a theoretical grasp on the resemblances in things that are very far apart is a matter of good guesswork. So it was that Archytas said that arbitrator and altar are the same thing; for it is to them both that someone who has suffered an injustice flees. Or if someone were to say that an anchor and a pothook are the same; for they are the same thing, but they differ with respect to the above and the below. And the "re-equalization" of cities[340] [signifies] the same thing in cases that are very far apart—the equality is in surface area and in [political] capacity.

In most cases elegant expressions are due to metaphors and to accompanying deception; for it becomes more clear to the listener that he has learned something new when this is contrary [to what he expected], and his soul seems to say "how true, and I was in error." And the elegance of epigrams also comes from their not meaning what they say—for example, the one of Steisichorus, that "their cicadas will sing to themselves from the ground."[341]

And good riddles are pleasing due to the same thing; for learning is involved and they are said by means of a metaphor. As too are what Theodorus calls "novel expressions." But this effect comes about when there is something unacceptable, and

335. *Philippus* 127. Flocks of sacred animals were allowed to roam freely within temple precincts. Isocrates is representing Phillip as such an animal, with the whole of Greece as his precinct.
336. Euripides, *Iphigenia in Aulis* 80.
337. Homer, *Odyssey* 11.598, *Iliad* 13.587, 4.126, 11.574, 15.542.
338. *Iliad* 13.799.
339. 1405ᵃ35–37, 1410ᵇ31–33.
340. Perhaps a reference to Isocrates, *Philippus* 40.
341. 1395ᵃ2.

not, as he says, something in accord with previous belief; instead, it is like the plays on words in jokes.

Jibes involving a change of letter have precisely this effect; for they involve deception. It also occurs in verse; for things may not be as the listener expected: "He strode along, having on his feet—*chilblains*!"; the listener was expecting "sandals."[342] And it should be clear as soon as it is uttered. Those involving a change of letter make the speaker mean not what he says, but what he twists the name to mean—for example, Theodorus saying to Nikon the lyre player, *thrattei*;[343] for he pretends to mean *thrattei se* and deceives us; for he means something else. That is why it is pleasing to the one who learns it, since if the listener does not know that Theodorus is a Thracian, it will not seem elegant. Also, *boulei auton persai*.[344] But both must be said in the way that is fitting.

Likewise too with elegant expressions. For example, saying that the *archê* of the sea was not the *archê* of the evils for the Athenians;[345] for they profited from it. Or—as Isocrates said[346]—the *archê* was for the city the *archê* of the evils. For in both cases what one would not think anyone would say is what is said and is recognized as true; for to say that an *archê* is an *archê* is to say nothing clever, but Isocrates does not mean it that way, but rather in another way, and he denies *archê* not in the sense he has spoken of it, but in another one.

In all these cases, if the name is introduced in a fitting way, whether by homonymy or metaphor, it is done well. For example, "*Anaschetos ouk anaschetos*";[347] the denial is by homonymy, but is used fittingly, if he is displeasing. Also, "do not make yourself more *xenos* than a *xenos*," or not more than you should be.[348] And the same with, "a *xenos* should not always be *xenos*";[349] for this too means something foreign [to what it says]. And the same with the much-praised line of Anaxandrides, "It is noble to die before doing anything that deserves death";[350] for this is the same as saying that someone deserves to die who does not deserve to die, or that someone deserves to die who does not deserve death, or who has done nothing that deserves death. The form of the style is the same in these cases, but the briefer and more oppositional the style,

342. Source unknown. The rhyme led the listener to expect *pedila* ("sandals"), the author substituted *chimethla* ("chilblains").
343. Reading θράττει. Theodorus says "you are a lyre strummer," or "you are confounded," but means "you are a Thracian strumpet or female slave."
344. The verb *mêdizein* ("Medize") means "side with the Medes." If there were a cognate verb *persein* ("Persianize"), the real or intended meaning would be "you wish him to Persianize," while the literal meaning is, "you wish to destroy him."
345. *Archê* means both "rule," or "command," and "start," or "beginning."
346. *Philippus* 61, *Panegyricus* 119, *De Pace* 101.
347. *Anaschetos*, as an adjective, means "endurable," but is also a proper name. An English equivalent would be, "There is no bearing Baring."
348. *Xenos* means "strange" (adjective) and "stranger" (noun).
349. Fr. 209 Kock. Author unknown.
350. Fr. 64 Kock.

the more popular it is. The cause of this is that learning comes about more because of opposition, and faster because of brevity.

And what is said should in addition always apply to the person addressed and be correctly expressed, if it is going to be true and not superficial; for these may be separate. For example, "One should die erring in nothing"; yes, but it is not elegant.[351] "A deserving man should marry a deserving woman";[352] yes, but it is not elegant. But if both are present at the same time it is elegant: "He deserves to die who does not deserve to die." And the more it has of these, the more elegant it appears—for example, if the names are a metaphor too, and a metaphor of the relevant sort, and there is antithesis, equalization, and it has activity.

Popular similes too, as has already been said above,[353] are also, in a way, metaphors; for they are always stated on the basis of two [relations], just like a metaphor by analogy—for example, "The shield," we say, "is the wine-saucer of Ares"[354] and "The bow is a stringless lyre."[355] This way of stating it, then, is not simple, while to say that the bow is a lyre or the shield a wine-saucer is simple. People also make similes in this way—for example, by likening a pipe player to an ape, or a shortsighted person to a spluttering oil-lamp (for both contract). And it is done well when it involves metaphor; for it is possible to liken a shield to "the wine-saucer of Ares" and a ruin to "the rags of a house," and to say that Niceratus is a like a "Philoctetes stung by a Pratys"—a simile used by Thrasymachus when he saw Niceratus, after his defeat by Pratys in a rhapsode contest, still long-haired and parched. It is especially in regard to these that poets are hissed off the stage, if they do not make them well, and if they do make them well, that they are popular. I mean when they would introduce a corresponding [metaphor]: "like curly celery the legs he wears,"[356] and "like Philammon punching his leather bag,"[357] and all things of this sort are similes. That similes are metaphors has been stated many times.

Proverbs are also metaphors, though from form to form. For example, if someone brings something into his house, being himself persuaded that it is good, and then is harmed, it is as "the Carpathian says of the hare"; for both suffered what was described.[358]

351. Source unknown.
352. Fr. 206 Kock. Author unknown.
353. 1407ᵃ11–14, 1410ᵇ15–18.
354. Timotheus, Fr. 21 Page. 1407ᵃ17–18.
355. Fr. 33 Page. Author unknown.
356. Fr. 207 Kock. *Selinon* is properly "celery," though also "parsley" (= *petroselinon*, or "rock celery"). Because of its curly labia-like leaves it is used in comedy and elsewhere as a slang term for the female genitals. It is this that makes *selinon* not just an element in a simile corresponding to legs, but also a metaphor. He wears his own twisted legs = he is "wearing" a woman's genitals on his penis. The next example also involves a sexual double entendre.
357. Fr. 208 Kock. A *kôrukos* is both a leather punching bag and a slang term for the male scrotum. It is apparently this that makes it a metaphor: punching his leather bag = masturbating.
358. Hares were introduced into the island as a benefit, but did more harm than good.

The sources of elegant expressions, then, and the cause due to which they are such have been pretty much stated.

Popular hyperboles are metaphors too. For example, saying of someone with a black eye that "you would have thought he was a basket of mulberries"; for his eye is somewhat purple, but there is exaggeration in the quantity. And in the expression "like so-and-so" there is hyperbole that differs in the style: "like Philammon punching his leather bag," and, "you would have thought that he was Philammon punching his leather bag," and, "like curly celery the legs he wears," and, "you would have thought he had celery for legs, so curly are they." Hyperboles are characteristic of young people; for they exhibit great exaggeration. That is why they are most used by those who are angry:

> Not even if he gave me as many gifts as there is sand or dust . . .
> Nor will I marry a daughter of Atreus' son, Agamemnon,
> Not even if she rivals Aphrodite the golden in beauty,
> Or the works of Athena.[359]

That is why it is unfitting for an older person to use it. (This [figure of speech] is **1413b1** especially used by Attic orators.[360])

3.12
Each Kind of Rhetoric Has Its Own Style

One should not overlook the fact, however, that a distinct style is fitting for each kind [of rhetoric]. For the writing style and the debating style are not the same; neither are the style of public oratory and judicial style. But it is necessary [for an orator] to know both; for the craft of debate involves having a scientific knowledge of how to speak correct Greek, while writing involves not being compelled to keep anything silent that one may wish to communicate to others—which is precisely the condition of those who do not have the scientific knowledge of how to write.

Writing style is the most exact, while debating style is most suited to delivery. And of the latter there are two forms; for one is expressive of character and the other of feeling. That is why actors too are in pursuit of these sorts of plays, and poets in pursuit of actors of these sorts. But poets who write plays suited to reading are also in demand—for example, Chaeremon (for he is as exact as a professional speechwriter), and, among the dithyrambic poets, Licymnius. And, when compared, the speeches of the writers appear thin in debates, while those of the orators appear prosaic in the hands. The cause of this is that their fitting place is in debates—which is why speeches intended for delivery, when the element of delivery is removed, because

359. Homer, *Iliad* 9.385, 388–390.

360. This sentence is secluded by Kassel. In the mss. it appears before the previous sentence.

of no longer doing their work, appear foolish. For example, cases of asyndeton and frequent saying of the same thing are correctly rejected in writing style, but not in debating style—indeed, the orators use them; for they are suited to delivery. But one must vary the expression when one says the same thing—which is precisely the factor that, as it were, paves the way for delivery: "This is the one who stole from you, this is the one who cheated you, this is the one who last of all attempted to betray you."[361] Also, for example, what Philemon the actor used to do in Anaxandrides' *An Old Man's Madness*, when he says "Rhadamanthus and Palamedes," and, in the prolog of *The Pious Ones*, the word "I";[362] for if one does not deliver things of this sort [with variation], it become a case of "the man carrying a beam."[363]

Similarly, with cases of asyndeton, I "came, met, begged"; for these must be delivered, and not spoken as if they are one [expression], in the same character and tone of voice. Further, cases of asyndeton have a special affection; for many things seem to be being said at the same time; for the connecting particle makes the many into one, so that if it is removed, it is clear that the contrary will result: the one will be many. Therefore, it involves amplification: I "came, discussed, beseeched" (what is said seems to be many things), "he overlooked everything I said." This is what Homer **1414ᵃ1** wishes to do in the passage

> Nereus, again, from Syme . . .
> Nereus, son of Aglaia . . .
> Nereus, the most noble man who . . .[364]

For a person about whom many things are said must also be often referred to. If someone is often referred to, then, it also seems [wrongly] that many things are being said about him. So Homer amplified [Nereus' importance], though mentioning him in only one passage and by means of this fallacy made him memorable, though no account at all is given of him later on.

The style of public oratory seems altogether like illusionistic painting (for the greater the mob is, the more distant the view; which is why exactness is superfluous and gives a worse appearance in both cases), while judicial speech is more exact. And that before a single judge even more so; for it is least of all "rhetorical"; for what properly belongs to the thing at issue and what is alien to it is more easily surveyed [by him], and debate is absent, so that the judgment is clear. That is why it is not the same orators who are popular in all these. But where delivery is most a factor, there exactness is least present. And this is where voice is a factor, and most of all where a

362. The idea, presumably, is that at these points Philemon used to repeat various lines in different formulations.
363. The point seems to be about the effects of repetition, which is like the uniform steps taken by someone carrying a beam.
364. *Iliad* 2.671–673.

loud one is. The epideictic style is most like that of writing (for its work is reading), while the judicial style comes second.

To make the further distinction that the style should be pleasant and magnificent is superfluous; for why that rather than temperate, generous, or some other virtue of character? For clearly the things we mentioned will make the style pleasant, if indeed the virtue of style has been correctly defined;[365] for otherwise for the sake of what should it be perspicuous and not low but appropriate? For if it is babbling, it is not perspicuous, nor if it is [too] concise, but it is clear that the mean is fitting. And the things mentioned will make the style pleasant, if they are well mixed: the customary and the unfamiliar, rhythm, and persuasiveness based on what is appropriate.

Style, then, has been spoken about, both in general about all kinds [of speech] and in a way special to each kind. It remains to speak about arrangement.

3.13
Arrangement

There are two parts to a speech; for it is necessary to state the thing at issue and also to demonstrate it. That is why to state without demonstrating or to demonstrate without having first stated is impossible; for the person demonstrating demonstrates something and the one first stating it first states it for the sake of demonstrating it. Among these, the former is the statement of the case and the latter the means of persuasion—just as if one were to make the division that one part was the problem and the other the demonstration.

As things stand, people make a ridiculous division;[366] for a narration surely belongs only in a judicial speech; for how in an epideictic speech or in one of public oratory can there possibly be the sort of narration they talk about, or replies to the opponent, **1414b1** or an epilog in demonstrative ones?[367] And an introduction, reply by comparison, and recapitulation sometimes occur in public speeches when there is a dispute, for in fact both accusation and defense often occur there, but not insofar as it is deliberative. Further, an epilog does not even belong in every judicial speech—for example, if the speech is short or if the thing at issue is easily remembered; for in the epilog what happens is that there is a reduction of length.

The necessary parts [of a speech], therefore, are the statement of the case and the means of persuasion. These, then, are its special ones, and the most it has are introduction, statement of the thing at issue, means of persuasion, and epilog; for the replies to the opponent belong to the means of persuasion, and the reply by

365. 1404b1–5.

366. Introduction (*prooimion*), narration (*diêgêsis*), means of persuasion (*pistis*), epilog (*epilogos*).

367. I.e., judicial speeches as they are required to be in cities that are in good legislative order (1354a18–26).

comparison is amplification of one's own case, so that it is a part of the means of persuasion; for one who does this demonstrates something, while the introduction does not and neither does the epilog, but rather serves as a reminder.

If one were to go on making divisions of this sort, then, which is precisely what the followers of Theodectes do, there will be a distinct narration, a post-narration, and a pre-narration, as well as a refutation and an additional refutation.[368] But a name should be assigned [only] if speaking of a form and a difference, otherwise it becomes empty and frivolous, like the ones Licymnius produced in his *Craft*, naming things "wafting," "wandering," and "ramifications."

3.14
The Introduction

The introduction is a speech's starting-point, which is precisely what a prolog is in poetry and a prelude in pipe playing; for all these are starting-points and a paving of the way, as it were, for what follows. The prelude is like the introduction in epideictic speeches; for in fact as pipe players play as a prelude whatever they are able to play well and join it to the keynote of the piece, so too in epideictic speeches this is the way one should write: after saying whatever one wishes, straightaway sound and join the keynote. And this is precisely what all writers do. A paradigm is the introduction in Isocrates' *Helen*, where there is nothing in common between those who employ contentious arguments and Helen. At the same time, even if the writer wanders into foreign territory, it is fitting for the whole speech not to be of the same form.

The introductions in epideictic speeches say things that are based on praise or blame—for example, Gorgias in his *Olympic Speech*, says, "You are worthy of the admiration of many, men of Greece . . . ;"[369] that is, he praises those who first brought the festal assemblies together, while Isocrates blames them because they honored the virtues of the body with gifts, but awarded no prize to those who think well. They also begin with advice—for example, that one should honor good people, which is why [the speaker] himself praises Aristides, or those who are neither well reputed nor bad but good though living in obscurity, like Paris the son of Priam; for one who speaks in this way offers advice. Further, they are based on introductions in judicial speeches, that is, on the appeals to the listener, if the speech concerns something **1415ᵃ1** unacceptable, hard to bear, or oft-repeated by many, in order to obtain sympathetic consideration [for discussing it]—for example, Choerilus': "Now when all subjects have been allocated. . . ."[370] The introductions in epideictic speeches, then, are based on the following: on praise, on blame, on exhortation, on dissuasion, and on appeals

368. The Greek terms are *epidiêgêsis, prodiêgêsis, elegchos, epexelegchos*.
369. B7 DK.
370. Fr. 1, 1a Kinkel.

to the listener. And they should be either unfamiliar or closely related to the keynote of the speech.

Introductions in judicial speeches should be taken to have precisely the same capacity as prologs in plays and introductions in epic poems; for those in dithyrambs are like those in epideictic speeches—for example, "due to you and your gifts or your battle spoils."[371] In the speeches and in epic poems there is a sample of the account, in order that the listeners may have some foreknowledge of what the account is about and their thought not kept in suspense; for what is unlimited makes a listener's thought wander, while the one who gives the starting-point into the listener's hand, so to speak, enables him, by holding on to it, to follow the account. This is why [we have]: "Sing, goddess, the wrath . . . ," and "Tell me, Muse, of the man . . . ,"[372] and

> Bring me another account, about how from the land of Asia
> There came to Europe a great war.[373]

The tragedians too make clear what the play is about—if not straightaway, as Euripides does, at any rate, somewhere in the prolog, as Sophocles does: "My father was Polybus. . . ."[374] And the comic dramatists do the same thing.

The most necessary and the special work of the introduction, then, is this: to make clear what the end is that the speech is for the sake of. That is why if the thing at issue is clear or [the speech] short, one should not use an introduction.

The other forms of introduction that are used are remedies and are common [to all the kinds of speeches]. These say things based on the speaker, the listener, the thing at issue, and the opponent. Those based on the speaker himself and the opponent are all those concerned with refuting or making an accusation. But these are not done in the same way; for in the defendant's case what comes first are the things having to do with the accusation, while in the accuser's they come in the epilog. Why this is so is not unclear; for the defendant, when he is about to introduce his own case, must do away with any hindrances to it, and so must first refute the accusation. But the one attacking him should put his accusation in the epilog in order that the listeners may remember it better.

Appeals to the listener [in the introduction] are based on producing goodwill and sometimes on making him attentive; for it is not always advantageous to make him attentive, which is why many speakers try to provoke laughter. Many things will lead to ease of learning, if the speaker wishes it, including his appearing to be a decent person; for the listeners pay more attention to such people. And they are attentive to
1415b1 large things, to their own private affairs, to wondrous things, and to pleasant ones. That is why one should try to produce the impression in them that one's speech is

371. Attributed to Timotheus, Fr. 18 Page.
372. The opening lines of the *Iliad* and *Odyssey*.
373. From the introduction to Choerilus, *Persica*. Fr. 1a Kinkel.
374. *Oedipus Tyrannus* 774. Reading ἐμοὶ πατὴρ ἦν Πόλυβος.

about such things; for, if they are not attentive, it is because the issue is small, has nothing to do with them, or is painful. But one should not overlook the fact that all such things are outside the argument; for they are addressed to a listener who is base and ready to listen to what is outside the thing at issue; for if he were not like that, there would be no need of an introduction, except for one that stated the thing at issue in headline form, in order that it have a head, as if it were a body.

Further, making the listeners attentive is common to all the parts [of the speech], if there is a need for it; for they are inclined to slacken more anywhere than at the start. That is why it is ridiculous to put it at the start, when all listen with the greatest attention. So wherever it is opportune, one should say, "and now give me your attention, for this concerns me no more than it does you," or "I'll tell you something strange, you've never heard the like of it," or anything so wondrous. This, as Prodicus said, is "to throw in some of the fifty-drachma lecture when the listeners nod."[375] But it is clear that this is not addressed to the listener insofar as he is a listener.

In fact all speakers in their introductions are either accusing or refuting accusations. [As in:] "My lord, I will not say that eagerly,"[376] and "why this introduction?"[377] Also, those who have, or believe themselves to have, a bad case [make use of introductions]; for it is better to spend time on anything other than the thing at issue. That is why slaves [when accused of something] do not answer questions but rather state the surrounding circumstances and produce introductions.

The sources from which one should produce listeners with goodwill and each of the other things of that sort have already been stated.[378] But since "grant that on reaching the Phaeacians I may find friendship or pity"[379] is well said, these are the two things one should aim at.

In epideictic introductions, however, one should make the listener think that he shares in the praise, either himself, his family, his practices, or in some other way;[380] for what Socrates says in the funeral oration is true, that it is not difficult to praise Athenians in front of Athenians, but in front of Spartans.[381]

Introductions in public oratory are based on those of judicial speech, but by the nature of the case there is little need of them; for in fact they are concerned with what the listeners also know, and the thing at issue needs no introduction, except because of the speaker himself or his opponent, or if the listeners do not take the thing to have the importance the speaker wishes, but either more or less. That is why it is necessary to accuse or to refute accusations, to amplify or diminish. And it is for the sake of

375. A12 DK.
376. Sophocles, *Antigone* 223. The messenger is reluctantly reporting the burial of Polyneices to Creon.

these things that an introduction is needed, or for the sake of ornamentation, lest the
1416a1 speech appear off-handedly done without it. For Gorgias' encomium to the Eleans is like that; for without any preliminary sparring or warm-ups he starts at once by saying, "Elis, happy city."[382]

3.15
Topics Concerning Accusation

One [topic] concerning accusation is based on anything with which one might remove offensive prejudice; for it makes no difference whether someone has expressed it or not, so that this way is universally applicable.

Another topic is to contest the things that are disputed: either they did not occur, or they were not harmful, or not harmful to this person, or not harmful to this degree; or they were not unjust, or not very, or not shameful, or without importance; for dispute is about things of this sort, as in the reply of Iphicrates to Nausicrates; for he said that he had indeed done what Nausicrates claimed and that it had caused harm, but that he had not done an injustice. Or, though admitting the injustice, counterbalance it: if it caused harm, that it was nonetheless noble, and if it caused pain, it was nonetheless beneficial, or something else of that sort.

Another topic: that it was an error, or a stroke of bad luck, or necessary, as Sophocles said that he was trembling not, as his accuser said, in order to seem old, but out of necessity; for it was not by his own volition that he was eighty years old. Also, the for-the-sake-of-which may counterbalance it—for example, that you did not wish to harm but rather so-and-so, and you did not do the thing of which you are accused, though it happened to have harmed: "Hating me would be just, if I had acted so as to bring it about."

Another: if the accuser is also involved [in similar actions], either at the present time or previously, either himself or one of those close to him. Another: if there are others who are involved [in similar actions] but are agreed to be not guilty of the accusation—for example, if so-and-so is an adulterer, because he is dressed in a refined way, what's-his-name must also be one. Another: if the accuser or someone else has accused others, or if—without [a formal] accusation—they were under the same suspicions as the defendant is now, and were shown not guilty. Another is based on counter accusing the accuser; for it is absurd, if he himself is untrustworthy, for his words to be trustworthy.

Another: if there has already been a judgment of the matter, as in Euripides' reply to Hygiaenon in an exchange of property trial,[383] when he was accused of impiety

382. B10 DK.

383. A person A assigned a public service could argue that another B was better able to pay its cost. He challenged B in court either to carry out the service in his place, if B admitted he was richer, or to exchange his wealth for A's, and then A would carry it out.

for having written a line encouraging perjury: "The tongue swore, but the mind is unsworn."[384] For he said that Hygiaenon was doing an injustice by bringing a judgment into the law courts that belonged in the court of Dionysus;[385] for there is where he gave an account of these words or where he will give one if anyone wished to bring an accusation.

Another is on the basis of accusing the accusation [itself], how great an evil it is, and this because it produces different judgments and because it does not persuade as to the thing at issue.

Common to both sides is the topic of speaking with [reference to] symptoms.[386] For example, in the *Teucer*, Odysseus claims that Teucer is closely related to Priam; **1416^{b}1** for [his mother] Hesione was Priam's sister; while Teucer says that his father Telamon was Priam's enemy, and that he has not betrayed the spies.

Another, for the accuser, is to praise some small thing at great length and then blame something big in a concise way, or first to present many good things, and then put forward the single thing that bears on the thing at issue and blame it. Speakers of this sort are most crafty and most unjust; for they attempt to do harm by means of good things, [that is,] by mixing them with what is bad.

Common to both attacker and defender is that, since the same action may be done for the sake of many things, the accuser should present the character as bad and interpret the thing in a worse direction, the defender in a better one—for example, saying that Diomedes deliberately chose Odysseus, on the one side, because he took Odysseus to be the best, and, on the other, not because of that, but because he alone, as someone inferior, would not be a rival.[387]

Concerning accusation let this much be said.

3.16
Narration

Narration in epideictic speeches is not continuous but part by part; for one should go through the actions on which the speech is based; for the speech is composed, on the one hand, from what is outside the province of craft (for the speaker is in no way the cause of the actions) and, on the other, from what comes from the craft, which consists in proving either that the actions did take place, if the audience is not persuaded, or that they were of a certain quality, of a certain quantity, or even all of them. This is why one should sometimes not narrate everything continuously, because things proved in this way are difficult to remember: on the basis of some actions the person is proved to be courageous, on the basis of others, wise or just.

384. Euripides, *Hippolytus* 612.
385. I.e., the theater, which is the proper venue in which to judge a play.
386. I.e., signs.
387. 1399^{b}28–29.

Also, a speech composed in this way is simpler, while in the other way it is complex and not plain sailing. Of well-known actions, the listener should just be reminded. That is why many people have no need of narration. For example, if one wishes to praise Achilles (for everyone knows his actions), one should instead make [other] use of these. If, on the other hand, one wishes to praise Critias, he does need it, for not many people know [his good actions]. {. . .}[388]

But nowadays [writers on rhetoric] say—ridiculously—that the narration should be rapid. And yet, as the man said to the baker when asked whether he should knead the dough hard or soft ("What?" he said, "is it not possible to do it well?"), so here too the case is similar; for one should not narrate at great length, just as one should not produce introductions or state the means of persuasion at great length either; for, in these cases too, doing these things well is not a matter of rapidity or concision but of [due] measure. And this consists in saying just as much as will make the thing at issue clear, or as much as will make the listener suppose that it has happened, that harm or injustice has been done, or things of whatever magnitude one wishes their magnitude to be—or, for the opponent, the opposites of these.

And one should narrate as an aside whatever bears on one's own virtue, for example, "I criticized him, by always stating what was just, telling him not to abandon the children," or bears on the opponent's vice, "but he answered me that, wherever he might find himself, there he would find other children"—which is what Herodotus[389] tells us the Egyptians who had revolted replied [to the king who had invited them to return], or what is pleasing to the judges.

For the defender the narration may be shorter; for what is disputed is either that the thing has not happened, was not harmful, was not unjust, or was not of the alleged magnitude. So one should not spend time on what is agreed, unless it contributes to [making the case]—for example, that the action was done, but that it was not unjust. Further, one should speak of the actions as done in the past, except for those that, when presented as being done in the present, conduce to pity or indignation. A paradigm is the story of Alcinous, as it is told to Penelope in sixty lines, or as Phaÿllus told the epic cycle, or the prolog in the *Oeneus*.

The narration should be expressive of character. And it will be if we know what makes the character. One thing that certainly does so is making the deliberate choice clear, and it is by the quality of this that the character is of a certain quality, and it is by its end that the deliberate choice is of a certain quality. This is why mathematical arguments do not involve character, because they do not involve deliberate choice (for they do not involve the for-the-sake-of-which), but the Socratic arguments do (for they speak of things of this sort[390]).

388. There seems to be a lacuna in the text at this point, which some mss. fill with a repeat of 1367b28–1368a10.

389. 2.30 (paraphrased).

390. Reading περὶ τοιούτων γὰρ λέγουσιν.

Other things expressive of character are those that follow along with each particular character—for example, that someone walks away as he was talking; for this makes clear his insolence and boorishness of character.

And do not speak as from thought, as they do nowadays, but as from deliberate choice: not "I wished it" or "for I deliberately chose it," but, "although I gained no benefit, it was better." For the former is characteristic of a practically wise person, the latter of a good one; for what is characteristic of a practically wise person consists in the pursuit of what is beneficial, and of a good one in that of what is noble.

If anything seems unpersuasive, also state its cause, as Sophocles does. A paradigm is the passage from the *Antigone*, that Antigone cared more for her brother than for either her husband or children; for if they perished they might be replaced,

> But when mother and father have gone to Hades
> No brother could ever be born.[391]

If you do not have a cause, say that you are not unaware that the things you are saying are unpersuasive, but that you are by nature a person of this sort, and in fact people are never persuaded that anyone voluntarily does anything other than what is advantageous.

Further, speak on the basis of feelings, narrating both the things that follow along with them, which the listeners know, and the ones that are special to oneself or to one's opponent: "And off he went, scowling at me," and, as Aeschines says about Cratylus, that he was "furiously hissing and furiously shaking his fists"; for these are means of persuasion, because these things they do know become symptoms of those they do not know. Many things of this sort are to be gotten hold of from Homer: "Thus she spoke, and the old nurse covered her face with her hands";[392] for those who start to cry put their hands over their eyes.

Also, you should straightaway present yourself too as a person of a certain sort, in order that the listeners may see you as such—your opponent as well; but do it concealing that you do it. And this should be easy to see from messengers; for we know nothing of what they are going to say. Nonetheless, we get some notion of it [from their demeanor]. Narration, though, should occur at many places, and sometimes not at the start.

In public oratory there is hardly any narration, because no one narrates about future things. But if there is narration at all, it is about things in the past, in order that, reminded of them, the listeners will deliberate better about things to come. In the latter case, however, the speaker does not do the work of an advisor. And if something is unpersuasive, promise to state the cause straightaway and to set it out with as many details as the listeners wish—for example, Jocasta in Carcinus' *Oedipus*

391. 911–912.
392. *Odyssey* 19.361.

is always promising, when the one inquiring about her son asks her questions, and Sophocles' Haemon.[393]

3.17
Means of Persuasion

Means of persuasion should be demonstrative, and, since dispute is concerned with four issues, the demonstration should bear on the disputed one—for example, if whether the thing happened or not is disputed, in the trial, the demonstration should most of all bear on this; if that it did no harm, on this; and if that it was not of such-and-such magnitude, or that it happened justly, likewise. And if the dispute is about whether this thing happened, do not forget that it is only in this dispute that it is necessary for one or other of the two opponents to be wicked; for ignorance is not the cause, as it might be if the dispute were about justice. So in this case one should spend time on it, but in the others one should not.

In epideictic speeches amplification is mostly for [arguing] that things are noble or beneficial; for the things at issue should be taken on trust. And in fact demonstrations rarely bear on these, unless they are unpersuasive, or someone else is held to be the cause of them.

In the speeches of public oratory one may dispute that something will be, or that though the things he [that is, the opponent] recommends will be, they will not be just, or beneficial, or of such-and-such magnitude. And one should also look to see whether anything outside the thing at issue is falsely stated; for such things appear to be proofs that the other ones are falsely stated too.

1418a1 Paradigms are more suited to public oratory, enthymemes to judicial oratory; for the former is concerned with the future, so it must quote paradigms from past events, while the latter is concerned with things that are or are not the case, which more admit of demonstration and of necessity; for what is past has a necessity about it.

Enthymemes should not be stated successively, but rather mixed in. Otherwise, they damage each other. For there is a defining mark of their quantity, "my friend, since you have spoken as much as a wise man should"[394]—yes, but not such things as he should. And do not look for enthymemes about everything. Otherwise, you will do precisely what some of those doing philosophy do, who deduce things that are better known and more persuasive than the things on the basis of which they state them. And when you are trying to arouse feelings, do not speak in enthymemes; for an enthymeme either knocks out feeling or is spoken pointlessly; for simultaneous movements knock out each other and either extinguish each other or make each other weak. Nor, when the speech is expressive of character, should you look for

393. The reference, apparently, is to *Antigone* 683–723.
394. Homer, *Odyssey* 4.204.

an enthymeme at the same time; for demonstration involves neither character nor deliberate choice.

Maxims should be used both in a narration and in a means of persuasion; for they are expressive of character: "And I have given the money—and this while knowing [the maxim] that one should not trust anyone." Or to arouse feelings: "And I do not regret it, although I have been treated unjustly; for though the profit remains his, the justice remains mine."

Speaking publicly is more difficult than judicial speaking, as makes perfect sense, because it is concerned with the future, the latter with what happened in the past, which is scientifically knowable "even to prophets,"[395] as Epimenides the Cretan said; for he used to "prophesize" not about the future things but about things that happened in the past but were unclear. And the law is a given in judicial speeches, and, having a starting-point, it is easier to find a demonstration. Also, public speaking does not afford many opportunities for leisurely digressions—for example, against the opponent, or about oneself, or to arouse feelings. On the contrary, it least of all does so, unless one wanted to divert attention. Therefore, when at a loss, one should produce a digression, precisely as the orators in Athens do—Isocrates too; for, even when giving advice, he brings accusations—for example, against the Spartans in the *Panegyricus*, and against Chares in *On the Peace*.

In epideictic speeches one should introduce episodes of praise, as Isocrates does; for he is always bringing someone in for this purpose. And what Gorgias used to say, that he was never left without a word, comes to the same thing; for if he is speaking about Achilles, he praises Peleus, then Aeacus, then the god, and likewise with [his] courage, which produces these and those things, or is of such-and-such a sort.

If you possess demonstrations, you should speak both in a way expressive of character and demonstratively, but if you do not possess enthymemes, in a way expressive of character. And to a decent person it fits more to appear good than an exact argument does. **1418^{b}1**

Refutative enthymemes are more popular than demonstrative ones, because whenever something produces a refutation, it is more clear that it deduces; for contraries set side by side are more readily known. Refutative ones directed against the opponent are not a distinct form, however, but belong among the means of persuasion. Some refute by objection, others by [counter] deduction.[396]

In both deliberative and judicial speech the starting speaker should state his own means of persuasion first, then meet the contrary ones, refuting them and pulling them to pieces beforehand. But if the opposition's case is prolific, meet the contrary points first, as Callistratus did in the Messenian assembly; for first refuting by anticipation the things they were likely to say, he then stated his own case. If you speak second, however, you should first speak to the contrary argument, refuting it and

395. B4 DK.

396. Reading τὰ μὲν λῦσαι ἐνστάσει τὰ δὲ συλλογισμῷ.

counter deducing, especially if it proved popular; for just as the soul is not receptive to a person against whom accusations have been made beforehand, in the same way it is not receptive to argument either, if the opponent seems to have spoken well. Hence one should make room in the listener for the argument one is going to give. And this will happen if you do away with [the opponent's arguments]. That is why it is by fighting against all of them, or the most important, the popular, or the easily refuted ones, that one will make one's own persuasive:

> The goddesses I will be allied with first, . . .
> For I do not think that Hera . . .[397]

In these lines [Hecuba] seizes first on what is most foolish.

So much for means of persuasion. As regards character, since there are some things which, if one says them about oneself, leave one open to envy, to a charge of long-windedness, or to disputation, and, if one says them about another, to a charge of abusiveness or boorishness, one must make another say them, precisely as Isocrates does in the *Philippus* and the *Antidosis*; as Archilochus does when he blames someone; for he makes the father say about his daughter in an iambus, "Nothing is unexpected or declared impossible on oath," and makes Charon the carpenter say in the iambus that starts, "Not for me the wealth of Gyges."[398] And as Sophocles does, when he makes Haemon speak to his father about Antigone as [reporting] what others say.[399] And sometimes one should also change one's enthymemes and turn them into maxims. For example, "People with understanding should bring about reconciliation when fortunate; for that way would be conducive to getting most." And expressed as an enthymeme, "For if it is whenever reconciliation is most profitable and conducive to getting most that one should be reconciled, then it is when one is fortunate that one should be reconciled."

3.18
Questioning

As for questioning, it is most opportune to do it when the opponent has stated one of
1419a1 the two [premises], so that when one additional question is asked something absurd results. For example, when Pericles questioned Lampon about the sacred rites of the savior goddess,[400] he replied that it was not possible for an uninitiated person to hear them. When asked if he knew them himself, he said he did. Pericles then asked, "And how so, since you are uninitiated?"

397. Euripides, *Trojan Women* 969, 971.
398. Fr. 122, Fr. 19 West.
399. *Antigone* 688–700.
400. I.e., Demeter.

Second, it is opportune when one point is evident and it is clear to the questioner that the opponent will grant the other; for having learned that [second] premise, he should not additionally ask about the evident one but should state the conclusion. For example, when Meletus stated that Socrates did not acknowledge the gods, but admitted that there was something he called a *daimonion*,[401] Socrates asked if *daimons* were not either children of gods or something divine, and when Meletus said, "They are," he replied, "Does anyone think there are children of gods but not gods?"[402]

Further, when the speaker is intending to prove that the opponent is stating contrary things or something unacceptable.

Fourth, when it is not possible for the opponent to refute you except by answering in a sophistical way; for if he answers that "it is so but it is not so," or "some are so, some are not," or "in one way it is so, in another not," the listeners shout out on the supposition that he is at a loss to answer. Otherwise, you should not attempt it; for if the opponent gets in an objection, you will seem to be beaten; for it is not possible to ask many questions, because of the weakness of the listener. That is also why one should compress enthymemes as much as possible.

One should give answers to ambiguous questions by dividing them by account and not concisely. And answers to things that seem to be contraries should be conveyed straightaway by the answer [itself], before [the opponent] asks further questions or deduces the conclusion; for it is not difficult to foresee the drift of the argument.

This and the means of refutation may be taken as evident to us from the *Topics*.[403]

When a conclusion is being drawn, if [the opponent] frames the conclusion as a question, you should state the cause. For example, when Sophocles was asked by Pisander if it seemed good to him, as it did to the other preliminary councilors, to put in place the Four Hundred, he said it did. "What? Did this not seem to you to be a wicked thing?" He said it did. "Therefore, what you did was wicked?" "Yes," he said, "for nothing else was better." And when the Spartan, who was being inspected for his term as overseer, was asked whether it seemed to him that the other overseers had been justly put to death, he said that it did. "But did you not put in place these same measures?" And he said that he did. "Therefore, would you not," he was asked, "be justly put to death too?" "No, indeed not," he said, "for they took bribes to do these things, while I did not, but rather with due consideration." That is why one should neither ask any question after drawing the conclusion nor frame the conclusion as a question, unless the balance of truth is much in one's favor. **1419^{b}1**

As for jokes, since they seem to have some use in debates, and Gorgias rightly said that one should "destroy the opponents' seriousness with laughter and their laughter with seriousness,"[404] we have stated in the *Poetics*[405] how many forms of jokes there

are. Among these, one lot is fitting for a free person, the other not. And so a speaker will take whatever one is fitting for him. Self-deprecation is more suited to a free person than buffoonery; for the self-deprecator makes a joke for the sake of himself, while the buffoon makes it for the sake of someone else.

3.19
Epilog

The epilog is composed of four things: what produces in the listener a good disposition toward the speaker himself and a bad one toward the opponent; amplifying and minimizing; what brings the feelings of the listener into a certain state; and recollection.

For the natural thing for him to do, after he has demonstrated that he is truthful and his opponent false, is to praise and blame and drive the point home. And one of two things should be aimed at: that he is a good person in the relevant respects or that he is one unconditionally or that his opponent is a bad person in the relevant respects or that he is one unconditionally. And the topics on the basis of which he should establish them as being of these sorts have been stated.[406]

After this, it is accord with nature to amplify or minimize what has already been proved; for the things at issue should be agreed to, if one is going to speak of their magnitude; for the growth of bodies too is from something preexisting. The topics from which amplifying and minimizing should be set forth were stated earlier.[407]

After this, when the things, their sorts, and how great they are are clear, one should induce the listener to feel the [relevant] feelings. And these are pity, indignation, anger, hatred, envy, jealousy, and strife. Their topics too were stated earlier.[408]

So it remains to recollect the things that were said previously. And this it is fitting to do in the way that people—speaking incorrectly—say one should do it in introductions; for in order to be easily learned, they prescribe saying things many times. But what one should in fact do [in the introduction] is state the thing at issue, in order that it not escape notice what the judgment is about, while here, in the epilog, one should speak in summary form of the things through which the conclusion has been proved.

And the starting-point is for the speaker to state that he has demonstrated the things he promised, so that what these things are and why they hold should be mentioned. And it is stated on the basis of a comparison with the opponent's case—comparing either what both have said about the same thing (for example, "but he said this about this, while I said that, and because of these things") or straight down point by point. Or on the basis of self-deprecation (for example, "he said this, while

406. 1.9.

408. 2.1–11.

I said that—and what would he have done if he had proved this, but [I had] not [proved] that?"). Or on the basis of questioning ("what has not been proved?" or "what did he prove?")—either by comparison or in a way that is in accord with nature given the statements made, first one's own, and again, if one wishes, those of the opponent separately. **1420^{b}1**

For one's final utterance the fitting thing is an asyndeton, in order that it be an epilog and not a speech: "I have spoken; you have listened; you have the facts; render judgment."[409]

POETICS*

1
Poetry as Imitation: Medium

Let us speak about the craft of poetry itself, and its forms, what capacity each of them has, and how plots should be constructed if the poetry is going to be done well, further, how many parts it should be composed of, and of what sorts, and similarly too about anything else related to this methodical inquiry, starting first, as is in accord with nature, from first things. **1447ª8**

Epic poetry and the poetry of tragedy, and further, comedy, dithyrambic poetry, most of the craft of pipe playing, and of lyre playing are all on the whole really imitations. But they differ from each other in three ways: in that the imitation has different media, different objects, or modes that are different and not the same. 15

For just as some people produce imitations of many things by making images with colors and shapes (some through craft, others through practice), still others do so by means of their voices, so too in the case of the crafts just mentioned, all 20 of them produce imitations using rhythm, speech, or harmony, either separately or in combination—for example, pipe and lyre playing (and indeed any other sort of playing that happens to be of the same sort as regards this capacity, such as playing the panpipes) make use only of harmony and rhythm, whereas the craft of dancers 25 makes use of rhythm only, without harmony—for these people too, through the rhythms that are shaped [into movements], produce imitations of characters, feelings, and actions. But the craft that uses unaccompanied prose or[1] verse—whether it mixes meters together or uses one single kind of meter—has no name up to now;[2] **1447ᵇ8** for we have no common name for the mime plays of Sophron and Xenarchus and for the Socratic dialogs, not even if someone were to produce their imitation in iambic trimeters, elegiacs, or any other such meter.

But people, to be sure, attach the making of poetry to the meter, naming some "elegiac poets" and others "epic poets," calling them "poets" not in virtue of imitation, but in virtue of their common use of meter. And in fact if a medical subject or 15 a topic on nature is dealt with in meter, people are accustomed to call the authors in the same way. But Homer and Empedocles share nothing in common apart from the meter. That is why, while it is right to call the former a "poet," the latter should

* Translated by C. D. C. Reeve. Text: R. Kassel, *Aristotelis De Arte Poetica* (Oxford, 1965), in consultation with P. Destrée, *Aristote Poétique* (Paris, 2021) and L. Tarán and D. Gutas, *Aristotle Poetics* (Leiden, 2012).

1. Reading ψιλοῖς ἤ.

2. Reading ἀνώνυμος τυγχάνει οὖσα.

be called a "natural scientist" rather than a "poet." Likewise, if someone were to produce an imitation by combining all the meters, as Chaeremon did with his *Centaur* (a mixed piece of poetry composed of all the meters), he too should be called a "poet." About these matters, then, let things be determined in this way.

But there are some crafts that make use of all the media just mentioned (I mean, rhythm, melody, and meter) like dithyrambic poetry and nomes, and also tragedy and comedy. The difference is that some make use of all of these at the same time, others do so in different parts.

These, then, are what I mean by the differences between the crafts in the media in which they produce the imitations.

2
Poetry as Imitation: Object

1448a1 Since imitators imitate people in action, and since it is necessary that these people be either excellent or base (for when we speak of character it pretty much always follows along with one or the other of these alone—for, in terms of character, everyone differs because of vice and virtue), it follows that they imitate either better people than we are, or worse, or else such as we are. It is likewise with the painters; for Polygnotus made images of those who are better, Pauson of those who are worse, and Dionysius of those similar to us. So it is clear that each of the imitations I have mentioned will also contain these differences, and will be different by imitating things that are different in this way. For even in dance, pipe playing, and lyre playing these dissimilarities can occur, as also in speeches and unaccompanied verse—for example, Homer imitates those who are better, Cleophon those similar to us, whereas Hegemon of Thasos, who was the first to write parodies, and Nicochares, the author of the *Deiliad*, imitate worse ones. Likewise for dithyrambs and nomes; for one can imitate people in precisely the same way as Timotheus and Philoxenus imitated the Cyclops. It is this difference that distinguishes tragedy from comedy; for the latter tends to imitate people who are worse than those present now and the former those who are better.

3
Poetry as Imitation: Mode

Further, a third difference among these is the mode in which one can imitate each of these things. For in fact one can use the same media to imitate the same things, sometimes by narrating (either becoming someone else, as Homer does, or keeping to his own voice without changing), or with all the imitators[3] serving as actors and being active.

3. Reading τοὺς μιμουμένους.

Imitation, then, has these three differences, as we said from the start, media, objects, and mode. So, from one perspective, Sophocles would be the same sort of imitative poet as Homer; for both imitate excellent people. From another perspective, though, he would be the same as Aristophanes; for both imitate doers of action, that is, people who act (*dran*). From which derives what we call *dramas*, so some people say, because they imitate people acting.

And that is why the Dorians lay claim to both tragedy and comedy. For among Dorians, it is the Megarians who lay claim to comedy, since the Megarians from around here claim that it arose at the time they established their democracy and those in Sicily do so, for the poet Epicharmus, who was from there, was much earlier than Chionides and Magnes. As for tragedy, some Dorians in the Peloponnese lay claim to it. They make the names a sign of this; for they say that they call the outlying villages *kômai*, whereas the Athenians call them *dêmoi*, on the supposition that comedians (*kômôdoi*) owe their name not to *kômazein* (that is, from reveling) but rather from their roaming around from one *kômê* to another, driven out in dishonor from the city. They also say that they use the term *dran* for acting, whereas the Athenians use *prattein*. **1448^{b}1**

About the differences in imitation, then, both how many they are and what they are, let these things be said.

4
Origins and Development: Tragedy

It seems that there are two causes that quite generally gave birth to the craft of poetry, and both are natural. For it is both the case that imitation is innate in human beings from childhood (and they differ from other animals in that a human being is especially prone to imitate, and indeed takes his first steps on the path to learning through imitation) and that everyone takes pleasure in products of imitation. A sign of this is what happens in fact; for we take pleasure in viewing the most exact likeness of things that are in themselves painful to see—for example, the shapes of the most worthless animals, or even of corpses. The cause of this too is that learning is most pleasant, not only to philosophers, but also to the others, although they share in it to a small extent. For because of this indeed people take pleasure in seeing likenesses, because, in viewing them, they come to learn and deduce what each of their elements is—for example, that this person here is so-and-so. Since, if it so happens that one has not seen the thing before, its likeness will produce pleasure not as a product of imitation, but because of its execution, colors, or some other such cause.

Since imitating, then, comes naturally to us, just as harmonies and rhythms do (for that meters are parts of rhythms is evident), it was, from the start, those most naturally gifted in these who, by developing them little by little, gave birth to poetry out of [their] improvisations.

Poetry was split up in accord with each poet's proper character; for the more dignified poets imitated noble actions, that is, those characteristic of such people, whereas the shabbier ones imitated the actions of base people, at first producing invectives (*psogos*), just as the others produced hymns and encomia. We cannot cite any such poem from any of the pre-Homeric poets, though it is likely that there were many. But starting from Homer we can—for example, the *Margites* is his, and others of this sort. It is in these that, fittingly, the iambic meter was introduced. That is why indeed the meter is now called iambic, because people used to lampoon (*iambizein*) each other in this meter. And, of the old poets, some became producers of heroic verses [in hexameters], others of lampoons [in iambic meters].

Just as Homer was the poet par excellence when it came to serious subjects (standing alone not only because he composed well but because he also produced *dramatic* imitations), he was also the first to indicate the characteristic mode (*schêma*) of comedy, by giving a dramatic form not to an invective but to the ridiculous; for the *Margites* stands in the same relation to comedy as the *Iliad* and the **1449a1** *Odyssey* do to tragedy.

And once tragedy and comedy had been given a glimpse of, each poet was impelled by his individual nature to one or the other of these: some became authors of comedies instead of lampoons (*iambos*), while others composed tragedies instead of epics, because the characteristic modes of comedy and tragedy are greater and more honorable. (To investigate whether tragedy is now adequately developed in its forms, whether judged intrinsically or in relation to its audiences, is for another account.[4])

In any case, tragedy, and comedy too, arising from an improvisational starting-point (the former from the leaders of the dithyramb, the latter from the leaders of phallic songs, which still today remain an established custom in many cities), grew little by little as poets developed whatever of it was coming to light. And once tragedy had gone through a lot of changes, it stopped [changing], since it had acquired its own nature. Aeschylus was the first to increase the number of actors from one to two, to reduce the parts of the chorus, and make speech the protagonist. Sophocles introduced three actors and scenery.

Further, [tragedy changed] in terms of scale: from its original small-scale plots and ridiculous style of speech—due to its having been changed from satyr play—tragedy became dignified at a late date. And the meter, from tetrameter, became iambic. For at first poets used tetrameter because their poetry was akin to a satyr play and more suited to dancing. But once speech came in, the nature itself [of tragedy] discovered its proper meter. For of meters the iambic is the closest to speech. A sign of this is that we very often use iambics in speaking with each other, but hexameters we use rarely and when do, we depart from the harmony of speech.

4. No such account is extant. However, in *Po*. 26 tragedy is compared to epic poetry from these two perspectives.

Further, as for the number of episodes, and how each of the other parts is said to have been arranged, let us take them as having been described. For it would presumably take a lot of work to go through each of them.

5
Origins and Development: Comedy and Epic

Comedy, as we said, is an imitation of people of a baser sort—not, however, base with regard to every sort of vice; rather, the ridiculous is only one part of what is ugly and shameful. For the ridiculous is a sort of error and shame that is neither painful nor destructive—for example, a ridiculous mask is from the outset ugly and distorted but not pained.

Now the transformations of tragedy and the poets who brought them about have not been forgotten, but in the case of comedy they have been forgotten because it was not taken seriously at the start; for in fact the official granted a chorus of comedians[5] only at a late date—they used to be amateurs. The first names we have of comic poets belong to a time when comedy had already taken on some of its characteristic modes. But no one knows who introduced the use of masks, prologs, a multiplicity of actors, and other such things. As for the production of plots, it comes originally from Sicily. From among the Athenian poets, however, Crates was the first to abandon the form of the lampoon and produce universal accounts,[6] that is, plots. **1449b1**

Epic poetry follows tragedy up to the point of being an imitation in verse of excellent people. But they differ in that epic makes use of a single meter and is a narration. Further, with regard to length, tragedy tries to stay within the limits of a single revolution of the sun, or a little beyond, whereas epic is indeterminate in terms of time. And it does differ in this respect, even though at first poets composed in the same way in tragedies and in epics. As for their parts, some they have in common, whereas others are special to tragedy. That is why whoever knows about excellent and bad tragedies knows about epics too; for the parts epic poetry possesses also belong to tragedy, but those that tragedy possesses are not all in epic poetry.

6
Tragedy: Definition, Parts, Plot

The craft of imitation in hexameters and comedy we will discuss later on. But for now, let us speak about tragedy, by taking up the definition of its substance that results from what has been said: tragedy, then, is the imitation of a serious and complete

5. The earliest official competition for comedies in Athens was in 486 BC.
6. 1451b8–10.

action that has magnitude, in embellished speech, with each of its forms used separately in the parts of it, by people acting and not by narration, accomplishing through pity and fear the purgation (*katharsis*) of such feelings.

By "embellished speech" I mean the sort that has rhythm and harmony—and by saying "its forms are used separately" I mean that some parts of it are brought about through verse alone and some through melodies (*melos*).

Since the imitation is produced by people acting, the first component of a tragedy is of necessity the order of the spectacle, next melody-composition, and style of speech, for it is in these media that they produce the imitation. By "style of speech (*lexis*)" I mean the construction of the verses itself; the capacity of what I mean by "melody-composition (*melopoiia*)" is entirely evident.

But since tragedy is the imitation of an action, and an action is performed by doers of action who are necessarily of a certain quality as regards their character and their thought (for it is through these that we say that their actions too are of a certain sort), and it is with respect to actions that they all succeed or fail, the plot is the imitation of the action; for by this "plot (*muthos*)" I mean the composition of events. By "characters" I mean that with regard to which we say that the doers of action are of a certain quality. By "thought (*dianoia*)" I mean the parts in which they demonstrate something or even express some universal maxim by speaking.

Necessarily, then, every tragedy has six parts, in accord with which the tragedy is of a certain quality. These are plot, character, style of speech, thought, spectacle (*opsis*), and melody-composition. For the parts with which they imitate are two, one is the mode, and the remaining three are the objects they imitate. And there is nothing else besides these. It is not, then, just a few poets, as it were, who have made use of these;[7] for every tragedy has spectacle,[8] character, plot, style of speech, melody, and thought likewise.

But the most important of these is the structure of events. For tragedy is the imitation not of people but of actions, that is, of a life. But both happiness and misery lie in action, and the end is a certain action and not a quality; and it is in virtue of their character that people are of a certain quality, but it is in virtue of their actions that they are happy or the contrary.[9] Therefore, actors do not act in order to imitate characters, but rather take on characters because of their actions. So it is the events, that is, the plot, that are the end of tragedy, and the end is the most important thing of all.

Further, there would be no tragedy without action, but we could have a tragedy without characters; for the tragedies of most of the young poets are without characters, and, in general, there are many such poets, as also happens in painting—for

7. Reading οὐκ ὀλίγοι αὐτῶν.
8. Reading ὄψιν ἔχει πᾶν.
9. Reading καὶ εὐδαιμονία . . . τοὐναντίον.

example, Zeuxis in relation to Polygnotus: Polygnotus is a good painter of characters, whereas the painting style of Zeuxis contains no characters at all.

Further, if someone puts speeches in succession that are expressive of character, however well composed in terms of style of speech and thought, he will not do what we saw[10] to be the work of tragedy. On the contrary, a tragedy that makes inferior use of these but has a plot, that is, a structure of events, will fulfill it much more. In addition, the most important things by which tragedy beguiles the soul are parts of the plot, namely, reversals and recognitions.

Further, a sign of this is that even beginners in producing poetry can produce exactness in style of speech and in characters, prior to their being capable of combining events—for example, pretty much all the early poets too.

Thus, the plot is the starting-point and (so to speak) the soul of the tragedy, whereas the characters are secondary. The situation is much the same too in the case of painting; for if someone were indiscriminately to anoint a surface with the most beautiful colors, he would not please as much as he would if he made a likeness in black and white. Moreover, tragedy is the imitation of action and, because of this above all, it imitates doers of action.

Thought comes third. It is the capacity to say what is pertinent and what is fitting, which is precisely what, in speeches, is the work of politics and rhetoric. And indeed, the old poets made their characters speak in a way proper to politics, but present ones make them speak in a way proper to rhetoric.

Character is what reveals the deliberate choice, of what quality it is. That is why there is no character involved in those speeches in which what the speaker deliberately chooses to do or to avoid is not clear.[11] And there is thought involved in speeches in which people demonstrate something to be the case or not, or state something universal.

Style of speech holds the fourth place.[12] As mentioned above, what I mean by "style of speech (*lexis*)" is expression through use of names, which has the same capacity in verse as in prose.

Of the remaining parts, melody-composition is the most important of the embellishments. Spectacle is capable of beguiling the soul, but is furthest removed from the province of craft and least properly belongs to the craft of poetry; for tragedy's capacity exists even without a performance and actors. Besides, the craft of the maker of masks and other stage properties has more control over the production of spectacles than does the poet's.

11. Reading ὁποῖά τις ἐν οἷς οὐκ ἔστι δῆλον ἢ προαιρεῖται ἢ φεύγει.

12. Secluding τῶν μὲν λόγων.

7
Plot: Completeness and Magnitude

These things[13] having been determined, let us next state of what quality the structure of events should be, since that is the first and most important element of a tragedy.

We have laid down that tragedy is the imitation of a complete, that is, a whole action, having a certain magnitude; for there are also wholes that have no magnitude. And a whole is that which has a starting-point, a middle, and an end. A starting-point is what does not itself come after something else of necessity, but after which something else naturally occurs or comes to be. The end is the contrary: it is itself what naturally occurs after something else, whether of necessity or for the most part, but after which there is nothing else. The middle is what both itself comes after something else and after which something else comes. Therefore, well-constructed plots should neither start at a random point nor end at a random point but make use of the forms mentioned.

Further, a nobly beautiful thing, whether a living being or any object composed of parts, must not only have these properly ordered, but also have a magnitude that is not random—for noble beauty lies in magnitude and order, which is why a nobly beautiful animal can be neither altogether tiny (for the viewing of it is confounded since it happens within an extent of time that comes close to being imperceptible) nor altogether large (for viewing it cannot take place at the same time, and its unity and wholeness is gone from the viewers' view—for example, if there were an animal a thousand miles long). So, just as in the case of bodies and animals, though they must have magnitude, in the case of plots as well, though they must have length, their length must make them easy to remember.

As for the limit of the length, the limit that relates to performances and perception does not belong to the craft; for if a hundred tragedies had to compete, they would compete by the water clock, as people say they once did.[14] But as for the limit that is intrinsic to the nature of the thing at issue, in every case the longer the plot is, up to the point of still being clear as a whole, the more nobly beautiful, as regards its magnitude, it is. Determining the matter in simple terms: in whatever magnitude, in accord with likelihood or necessity, a succession of events can come about, in which a change from good luck to bad luck, or from bad luck to good luck, occurs—this is an adequate limit of the magnitude.

13. I.e., tragedy's parts.
14. Reading ὥσπερ ποτὲ καὶ ἄλλοτέ φασιν.

8
Plot: Unity

A plot is not one unity, as some people think, if it concerns one individual; for many, even an unlimited number of things, happen to one individual, from some of which no one unified thing is composed. And in the same way there are many actions of a single individual from which no one single unified action comes about. That is why all those poets err, as it seems, who composed a *Heracleid* or a *Theseid*, or poems of this sort; for they think that, since Heracles was one individual, it belonged to the plot to be one unity as well. But just as Homer was superior in other respects, it seems that, whether due to craft knowledge or due to nature, he also saw this correctly; for in composing the *Odyssey* he did not include everything that happened to Odysseus—for example, that he was wounded on Mount Parnassus or pretended to go mad when called to arms, the happening of neither of which events made it either necessary or likely for the other to happen. Instead, Homer composed the *Odyssey* around one single unified action of the sort we mentioned, and likewise too the *Iliad*.

It is necessary, then, that just as in the other imitative crafts a single imitation is of a single thing, so too the plot, since it is the imitation of an action, must be of one unified action and of it as a whole. And its parts, the events, must be so composed that if one of them is transposed or removed, the whole is disjointed and disturbed; for a thing whose presence or absence produces no clearly visible effect is no part of the whole.

9
Plot: Universality and Necessity

It is also evident from what has been said that the work of the poet is to speak not about things that have happened, but about things such as they could have happened and are possible in accord with likelihood or necessity. For the historian and the poet do not differ due to the one speaking in verse, the other without verse (for the histories of Herodotus could be set in verse, but they would be no **1451b1** less a sort of history when in verse than without verse). Instead, the difference is this: the one speaks about things that have happened, the other about things such as could happen. This is also why poetry is more philosophical and a more serious thing than history; for poetry speaks more about the universal, history about the particulars. The universal, on the one hand, is this: the sort of thing that a certain sort of person would say or do, in accord with likelihood or necessity, which is what poetry aims at, while adding proper names. A particular thing, on the other hand, is what Alcibiades did or what he suffered.

In the case of comedy this has already become clear; for after having composed a plot by means of likelihoods, comic poets assign random names, and do not, like the lampoonists, compose poems about particular individuals. But in the case of tragedy,

poets keep to the names of people there have been. The cause of this is that the possible is persuasive. But what has not happened, we are not yet persuaded is possible, whereas it is evident that what has happened is possible; for it would not have happened if it were not possible. Nonetheless, some tragedies in fact have only one or two familiar names, the others being made up, while others have none—for example, Agathon's *Antheus*; for in it the events and the names are alike made up, and yet it provides no less enjoyment. So one must not seek to cling at all costs to the traditional stories that tragedies are about. For in fact it is ridiculous to seek this, since even the familiar ones are known only to a few people, but they provide enjoyment to everyone, nonetheless.

It is clear, then, from these considerations that a poet should be a composer of plots rather than of verses, to the extent that he is a poet in virtue of imitation, and imitates actions. Therefore, even if it turns out that he produces imitations of things that have happened, he is no less a poet; for nothing prevents some of the things that have happened from being the sorts of things that are likely to happen, that is, that are capable of happening,[15] and it is in virtue of that aspect of them that he is a poet.

Of simple plots and actions, the episodic ones are the worst. By "episodic" I mean a plot in which the episodes follow each other with neither probability nor necessity. Such plots are composed by inferior poets because of themselves, but by good ones because of the actors; for while composing competition pieces and extending the plot beyond its capacity, they are often compelled to distort the succession of events.

1452a1 But the imitation is not only of a complete action, but also of events that cause pity and fear, and these mostly occur when they happen because of each other contrary to expectation; for they will contain more of the element of wonder this way than if they happened by chance or by luck, since even of events that happen by luck the most wondrous seem to be those that appear to have happened as if on purpose—for example, when the statue of Mitys in Argos killed the person who was the cause of Mitys' death by falling on him as he was looking at it; for such things seem not to happen fortuitously. So it is necessary for plots of this sort to be more nobly beautiful.

10
Plot: Simple and Complex

Of plots, some are simple and some complex; for in fact the actions of which the plots are imitations are from the outset also of these sorts. By "simple action" I mean one that comes about in a continuous and unified way (as has been defined), where the change of luck (*metabasis*) occurs without reversal or recognition. By "complex action" I mean one in which the change of luck involves a recognition, a reversal, or both. And these must arise from the structure of the plot itself, so that as a result

15. Reading καὶ δυνατὰ γενέσθαι.

of things that have previously come about, these things, either from necessity or in accord with likelihood, come about; for it makes a great difference whether these things happen because of those or [only] after those.

11
Reversal, Recognition, Suffering

A reversal (*peripeteia*) is a change in the actions to their contrary, as we said,[16] and this, as we are saying, in accord with likelihood or necessity—for example, in the *Oedipus* though the person came in order to bring joy to Oedipus and to relieve him of his fear about his mother, by revealing who he was, he did the contrary.[17] And in the *Lynceus*,[18] though Lynceus is being led as if he is going to be killed, and Danaus follows him as if to kill him, it so happens from the actions done that the latter is killed and the former saved.

Recognition (*anagnôrisis*), as the name itself signifies, is a change from ignorance to knowledge, which leads either to friendship or to enmity, between those whose relation to good luck and bad luck has been determined.

A recognition is most nobly beautiful when it occurs at the same time as a reversal, as with the one in the *Oedipus*. But there are certainly other sorts of recognition too; for also in relation to inanimate objects and random events it is possible for it to happen precisely in the way stated,[19] and one can recognize whether someone has done something or not done it. But the sort that most belongs to plot, that is, that most belongs to action, is the one we have stated; for this sort of recognition-cum-reversal will involve either pity or fear, which are the sorts of actions tragedy has been established to be an imitation of, since both bad luck and good luck will result from things of this sort.

And since recognition is recognition among people, some recognitions are by only one of the two people of the other, when it is clear who the other is. But sometimes there must be recognition on both sides—for example, Iphigenia was recognized by Orestes as a result of her sending the letter, but for him to be recognized by Iphigenia there had to be another recognition.[20]

These, then, are two parts of the plot: reversal and recognition. The third is suffering. Of these, reversal and recognition have been discussed. As for suffering, it is [entailed by] destructive or painful action—for example, deaths that are out in the open,[21] as well as excessive pains, wounds, and things of this sort.

16. Perhaps 1451a12–15.

19. Reading ὥς ὅπερ εἴρηται συμβαίνει.
20. Euripides, *Iphigeneia in Tauris* 727–841.
21. As opposed to concealed or covered up.

12
Prolog, Episode, Choral Part

The parts of tragedy that should be put to use as formal elements have been stated previously. But in terms of quantity, that is, the separate parts into which it is divided, these are as follows: prolog, episode, exit, and choral part, and the latter is divided into choral entry and choral ode. These are common to all tragedies, whereas actors' songs onstage and dirges are special to some.

A prolog (*prologos*) is a whole part of a tragedy, the one that is before the choral entry. An episode (*epeisodion*) is a whole part of a tragedy, the one that is between whole choral melodies. An exit (*exodos*) is a whole part of a tragedy after which there is no choral melody. Of the choral part, the choral entry (*parodos*) is the first whole choral style of speech (*lexis*); a choral ode (*stasimon*) is a choral melody that is without anapests or trochees; and a dirge (*kommos*) is a lament shared between chorus and actors onstage.

The parts of tragedy that must be used as formal elements have been stated previously, while in terms of quantity, the separate parts into which it is divided are these.

13
Guidelines for Plot Construction

What poets must aim at and what they must beware of in composing plots, and from what the work of tragedy will come about, would be the next things to discuss after the ones talked about just now.

Since, then, the composition of the most nobly beautiful tragedy must be not simple, but complex, and moreover it must be the imitation of events that cause fear and pity (for this is special to this sort of imitation), it is clear, first, that decent men must not be shown changing from good luck to bad luck (for this does not cause fear or pity, but is repulsive), nor depraved ones changing from bad luck to good luck; for this is the most unsuited to tragedy of all, since it has nothing of what it must have; for it is neither appealing to our fellow feeling for humans, nor does it cause pity or **1453a1** fear. Nor, again, must it show a thoroughly wicked person falling from good luck into bad luck; for a composition of this sort, though it can include what is appealing to our fellow feeling for humans, involves neither pity nor fear, for pity is felt for the one whose bad luck is undeserved, and fear for a person like ourselves, so that the outcome will cause neither pity nor fear.

There remains, therefore, the person who is intermediate between these. A person of this sort is one who is neither outstanding in virtue and justice, nor does he undergo a change to bad luck because of vice and wickedness, but rather because of some sort of error, and who is one of those people who have a great reputation and

good luck—for example, Oedipus, Thyestes,[22] or other notable men belonging to such families. Necessarily, therefore, a plot shaped in a nobly beautiful way is simple rather than (as some people say) double, and involves a change not from bad luck to good luck, but rather the contrary, from good luck to bad luck, not because of wickedness, but because of a great error committed either by a person of the sort just mentioned, or by a better rather than a worse person.

A sign of this is also what is in fact taking place; for at first poets recounted stories at random, but now the most nobly beautiful tragedies are composed about a few households—for example, about Alcmeon, Oedipus, Orestes, Meleager, Thyestes, Telephus,[23] and those others who happen to have suffered terrible things, or done them.

The tragedy that in accord with the craft of tragedy is most nobly beautiful, then, comes from this sort of composition. And that is why those who criticize Euripides for doing this in his tragedies (namely, that many of them end in bad luck) are making the same error. For that, as was said, is the correct thing. A most important sign of this is that onstage and in competitive performances these tragedies are manifestly the most tragic—provided they are staged successfully. And Euripides, even if he does not manage things well in other respects,[24] is manifestly the most tragic of the poets.

Second in noble beauty, which is said to be first by certain people,[25] is the tragedy that has a double composition like the *Odyssey*, and ends in contrary ways for the better and the worse people. It seems to be first, however, because of the weakness of the spectators; for the poets, in composing plays, follow the wishes of the spectators. But this is not the pleasure of tragedy, but rather belongs more properly to comedy; for there the worst enemies in the story (for example, Orestes and Aegisthus[26]) exit as friends at the end, and no one is killed by anyone.

14
Sources of the Tragic Effect

Now fear and pity can come about from the spectacle, but they can also do so from **1453b1** the structure of events itself, which is precisely a more primary thing and characteristic of a better poet. For the plot must be so structured that, even without seeing them, anyone who hears about the events as they unfold, will shudder and feel pity at

22. As portrayed in Sophocles' lost *Thyestes in Sicyon*, where he unwittingly commits incest with his daughter Pelopia.

23. Alcmaeon and Orestes killed their mothers to avenge their fathers (1253b24, 33); Meleager and Telephus killed their uncles by accident.

24. 1454a29–33, 1454b1, 1454b31–32, 1456a26–27, 1461b20–21.

25. Secluding σύστασις.

26. In tragedy, Orestes, Clytemnestra's son, kills her lover Aegisthus; no extant comedy has them become friends instead.

what happens, which is just what one would feel on hearing the plot of the *Oedipus*. To produce this effect by means of spectacle lies more outside the province of craft and requires lavish expenditure. But those, who by means of spectacle, produce not fear but only what is monstrous, have nothing in common with tragedy; for one must not seek every sort of pleasure from tragedy but only the one proper to it. Since what the poet must produce is the pleasure that comes from pity and fear by means of imitation, it is evident that it must be built into the events.

Of things that happen, let us now get a grasp on what sorts of them are manifestly terrible and what sorts lamentable. It is necessary, then, for actions of these sorts to be of friends in relation to each other, or of enemies, or of neither. If, then, it is enemy in relation to enemy, there is nothing causing pity, either in doing it or being about to do it, except in the suffering itself. Nor is there, if they stand in neither relation. But when the sufferings take place in friendships—for example, when brother kills, or is about to kill brother, or does something else of this sort, or son father, or mother son, or son mother—these are the ones that must be sought out.

One cannot, to be sure, undo the traditional stories (I mean, for example, Clytemnestra's being killed by Orestes or Eriphylus by Alcmeon[27]), but the poet must invent plots for himself and use in a nobly beautiful way the stories that have been handed down.

Let us state more perspicuously what we mean by "in a nobly beautiful way." For it is possible for the action to come about in the way the old poets made it do, that is, in full knowledge and awareness, just as Euripides too made Medea kill the children. But it is also possible for someone to do the action, do the terrible thing while being in ignorance, and then later recognize the friendship, as Sophocles' Oedipus does (this instance is outside the drama, of course, but within the tragedy itself we have, for example, Astydamas' *Alcmaeon* or Telegonus in the *Wounded Odysseus*[28]). And a further third possibility beyond these is to be about to do something irreparable because of ignorance, but to recognize the friendship before doing so. And beyond these cases there are no others. For it is necessary either to do an action or not to do an action, and to do so knowingly or not knowingly.

Of these to be, in full awareness, about to do the action, and not to do it is the worst; for this is repulsive, and not tragic; for there is no suffering. That is precisely why no one composes in this way, except rarely—for example, Haemon against Creon in the *Antigone*.[29] And to do the action in full awareness is second worst. Better is to do the action in ignorance and, having done it, to recognize [the friendship]; for there is nothing repulsive present in it and the recognition causes surprise (*ekplêxis*). But the best one is the last. I mean, for example, the *Cresphontes*,[30] where Merope is about to kill her son, and does not kill him, but rather recognizes him, as did the

27. 1453a20.
28. Perhaps by Sophocles.
29. Sophocles, *Antigone* 1232–1243.
30. Of Euripides.

sister her brother in the *Iphigenia*,[31] and in the *Helle*,[32] where the son was about to hand over his mother [to the enemy], but recognized her.

That is why indeed, precisely as we said just now, tragedies are not about many families. For, seeking not due to craft but due to luck, poets discovered how to produce this sort of effect in their plots. They are compelled, then, to turn to families in which such sufferings have happened.

Where the structure of events is concerned, then, and of what sorts plots should be, enough has been said.

15
Character

Where people's characters are concerned, on the other hand, there are four things the poet must aim at.

First and foremost, they must be worthy.[33] And there will be a character if, as was said,[34] their speech or action reveals a certain deliberate choice, whatever it may be, and a worthy character if their deliberate choice is worthy. And it can exist in each kind of person; for even a woman can be worthy, as can a slave, although presumably the first of these is inferior, and the second wholly low in rank. Second is fittingness; for it is possible for a man to be courageous[35] in character, but it is not fitting for a woman to be courageous or powerful to such a degree. Third is life-likeness. For this is different from making the character worthy or fitting in the way just stated. Fourth is consistency. For even if the person on whom the imitation is modeled is inconsistent, and this sort of character is taken for granted, it must still be consistently inconsistent.

An example of wickedness of character, not required by any necessity, is the Menelaus in *Orestes*;[36] of the unfitting and unsuitable character, the lament of Odysseus in the *Scylla*[37] and the speech of Melanippe;[38] and of the inconsistent character, *Iphigenia in Aulis*; for the supplicating Iphigenia is nothing like the later one.

And likewise in the characters too, just as also in the structure of events, the poet must always seek what is either necessary or likely, so that it is either necessary or likely for this sort of person to say or do these sorts of things, and necessary or likely for this event to come about after that one.

31. 1452ᵇ6–8.
32. Author unknown.
33. 1453ᵃ8–10.
34. 1450ᵇ8–9.
35. Reading ἀνδρεῖον.
36. Of Euripides.
37. Dithyramb by Timotheus.
38. In Euripides' lost *Melanippe the Wise*.

It is evident, then, that the resolutions of plots too must come about from the plot
1454b1 itself, and not from a deus ex machina, as in the *Medea*, and the *Iliad* scene of the launching of the ships.[39] But a deus ex machina must be used for what is outside the drama—either whatever things have happened beforehand and that no human being could possibly know, or whatever ones happen afterward that need to be foretold or
5 announced (for we assign it to the gods to see all things). However, there should be no non-rational element in the structure of events, unless outside the tragedy—for example, that in Sophocles' *Oedipus*.

Since tragedy is an imitation of people better than ourselves, the poet must imitate the good portrait painters. For in fact they, while making them life-like by rendering
10 the individual person's outward shape, paint them as more nobly beautiful. So too the poet in imitating people who are angry, lazy, or have other traits of this sort, must, in the case of their characters, make them of this sort but decent—for example, Homer made Achilles both a good man and a paradigm of harshness.[40]

The poet, then, should observe these rules, and in addition to these he should
15 observe whatever is a result of the perceptions that of necessity follow along with the craft of poetry; for in fact it is possible often to err with respect to these. But enough has been said about these in my published accounts.[41]

16
Forms of Recognition

What recognition is was stated previously.[42] As for the forms of recognition, the first is the one which is most outside the province of craft and which poets make
20 most use of through lack of resourcefulness, namely, recognition by means of signs. Of these, some are congenital birthmarks—for example, "the spearhead-shaped one that the earthborn bear,"[43] or those in the shape of stars like the ones Carcinus uses in his *Thyestes*. Others, though, are acquired. And of these, some are on the body—for example, scars; others are external—for example, necklaces, or the recognition because of the boat in the *Tyro*.[44]

25 But it is possible to put these too to better or worse use—for example, Odysseus was recognized in one way by the nurse and in another by the swineherds;[45] for the recognitions done for the sake of persuasion, that is, all recognitions of this sort, are

39. Homer, *Iliad* 2.109–210.
40. Reading παράδειγμα σκληρότητος post ἀγαθὸν καὶ.
41. Possibly the lost dialog *On Poets*.
42. 1452a29–32.
43. Possibly from Euripides' lost *Antigone*.
44. Of Euripides. Tyro's two sons were set adrift in a boat, which Tyro recognized later on.
45. Homer, *Odyssey* 19.386–475, 21.205–225.

more outside the province of craft, whereas those that result from a reversal, like that in the Bath Scene, are better.

Second are those made up by the poet, this being why they are outside the province of craft. For example, how Orestes in the *Iphigenia* makes it known that he is Orestes;[46] for Iphigenia is recognized by means of the letter, whereas he himself says what the poet wishes, but not what the plot does. That is why it is something close to the error mentioned, for he too might have brought recognizable things with him. Also, the voice of the shuttle in Sophocles' *Tereus*.[47]

Third is by means of a memory, when someone reacts to seeing something, as in Dicaeogenes' *Cypriots* (for on seeing the painting, the protagonist bursts into tears), or as in the *Tale to Alcinous*[48] (for on hearing the lyre player and remembering, Odysseus weeps), as a result of which they were recognized.

Fourth is recognition based on a deduction—for example, in the *Libation Bearers*:[49] someone similar to me [Electra] has come; but there is no one similar to me except Orestes; therefore it is he who has come. Or the sophist Polyidus' recognition concerning Iphigenia; for it would be likely, he said, for Orestes to deduce that his sister was sacrificed, and so it falls to him to be sacrificed too. Or in Theodectes' *Tydeus*: having come in order to find his son, he is to die himself. Or the recognition in the *Sons of Phineus*;[50] for when the women saw the place, they deduced their fate, namely, that they were fated to die there; for in fact it is where they were exposed as infants.

There is also a combined sort of recognition resulting from a fallacious inference by the audience—for example, in *Odysseus the False Messenger*;[51] for the fact that he, and no one else, could bend the bow is made up by the poet and is a premise, as indeed is [Odysseus'] saying that he would recognize the bow that he had not seen. But to suppose him to be recognized by means of this involves a fallacious inference.[52]

The best of all recognitions is the one resulting from the events themselves, when the surprise comes about by means of likelihoods—for example, in Sophocles' *Oedipus* and the *Iphigenia*; for there it is likely that Iphigenia would wish to send a letter. For only recognitions of this sort are without made-up signs and necklaces. Second best are those that result from deductions.

46. Euripides, *Iphigenia in Tauris* 727–841.
47. Tereus raped Philomela and cut out her tongue to silence her; but a tapestry she wove on her loom revealed what he had done.
48. Homer, *Odyssey* 8.521–586.
49. Aeschylus, 168–234.
50. Perhaps of Sophocles.
51. Author unknown.
52. The text is uncertain. The idea seems to be this. The poet tells us that Odysseus alone can bend the bow, which is true. Therefore, his doing so would allow him to be recognized. In fact, however, he is recognized in the play by his knowing that the bow is his when he sees it. But that involves a false inference, since many people know that the bow is his.

17
Setting before the Eyes, Stories, Gestures, Episodes

In constructing plots and elaborating them by the style of speech, the poet must set things before the eyes as much as possible; for in this way, seeing them most vividly, as if he were actually present at the actions, he can find what is fitting and is least likely to overlook things that are contrary to each other. A sign of this is the criticism leveled against Carcinus. For his Amphiaraus was returning from a sanctuary, which the poet,[53] not visualizing it, failed to notice, and the play failed onstage because the spectators were annoyed at it.

As far as possible the poet must also elaborate his plots with gestures; for the ones who are most convincing are those who, from the same nature [as ourselves], are inside the feelings, and the one who feels distress most truly distresses us, and the one who feels anger most truly angers us. That is why the craft of poetry is for the naturally clever rather than for the manic person;[54] for the former are versatile, while the latter are excitable.

As for stories, both those that are ready-made and those he makes up, he must set them out in universal terms[55] while he is composing them, and then in this way work out the episodes and extend them. I mean that he might get a theoretical grasp on the universal in the following way, for example, in the story of Iphigenia: "A certain girl, having been offered as a sacrifice, disappears in a way that is unclear to those who sacrificed her, and is set down in another country, where it was the custom to sacrifice strangers to the goddess, whose priesthood the girl came to hold. Some time later the priestess' brother happens to arrive (the fact that god's oracle ordered him to go due to a certain cause is outside the universal,[56] and for what purpose he went, is outside the plot), and, having arrived and been captured, is about to be sacrificed by his sister, when he makes himself recognized (either in the way Euripides made him do it or in the way Polyidus did[57]) by saying, as would be likely, that it was not only his sister's fate to be sacrificed, therefore, but also his own. And from that comes his rescue." After this point the poet must supply names and work out episodes; and in such a way that the episodes will properly belong [to the plot]—for example, in the case of Orestes, the madness through which he was captured, and his rescue through purgation.

In dramas the episodes are short, whereas epic is lengthened out with them. For the story of the *Odyssey* is not long: "Someone has been away from home for many years, guarded against returning by Poseidon, and alone. Further, things at home are such that his wealth is being consumed by his wife's suitors, his son plotted against.

53. Reading τὸν ποιητὴν.

55. 1451b8–10.
56. Reading ἔξω τοῦ καθόλου post ἐκεῖ.
57. 1455a6.

He arrives home after much distress, makes himself recognized by certain people, launches an attack, and he himself survives while he destroys his enemies." This is what is special to it; the other things are episodes.

18
Complication, Wonder, Chorus

In every tragedy there is a complication and a resolution. Things outside it, and often some of the things inside it, are the complication, the rest is the resolution. By "complication (*desis*)" I mean what goes from the start up to the part that is the last [point] from which there is a change either to good luck or to bad luck, while by "resolution (*lusis*)" I mean the part from the start of the change of luck up to the end. For example, in Theodectes' *Lynceus*, the preceding actions, the capture of the baby, and then [the parents'] accusation[58] is the complication, whereas from the accusation of murder up to the end is the resolution.

There are four forms of tragedy (the same number, in fact, has been mentioned also for the parts): the complex form, the whole of which consists in reversal and recognition; the tragedy of suffering—for example, the ones about Ajax[59] or Ixion; the tragedy expressive of character—for example, the *Women of Phthia* and the *Peleus*;[60] the fourth **1456ᵃ1** is [mere] spectacle[61]—for example, the *Daughters of Phorcys*,[62] the *Prometheus*,[63] and those set in Hades.

Now preferably the poet must try to include all these, otherwise, the most important ones and as many as possible, especially given the way people criticize poets nowadays; for because for each part there have been poets good at it, they expect a single poet to surpass the special good of each of them. But it is right to say that one tragedy is different from, or the same as, another by reference to nothing other than its plot, that is, whether they have the same complication (*plokê*) and resolution. Many poets complicate well, but resolve badly; but both must be coordinated.

It is necessary for poets to remember, though, precisely what was said many times,[64] not to compose a tragedy with an epic structure (by "epic" I mean many-plotted)—for example, if someone were to make a tragedy out of the whole of the *Iliad*'s plot. For there, because of its length, the parts take on the fitting magnitude, whereas in dramas what results is very much contrary to what is supposed. A sign of this is that

58. Reading ἡ αὐτῶν αἰτίασις.
59. By Sophocles, Carcinus, Theodectes, and others.
60. Both perhaps by Sophocles.
61. Reading ὄψις.
62. Either the Gorgons or the women who guarded them.
63. Of the Promethean trilogy of Aeschylus, only *Prometheus Bound* is extant.
64. Perhaps 1455ᵇ15–23.

those who composed a sack of Troy as a whole, and not in part, as Euripides did,[65] or the whole of Niobe's story,[66] and not like Aeschylus [a part], either fail or do badly in competitions, since in this alone even Agathon failed.

In reversals and in simple actions, poets aim to achieve the effects they wish by using wonder; for this is tragic and is appealing to our fellow feeling for humans. This is possible when someone who is wise but wicked is deceived, like Sisyphus, or when someone who is courageous but unjust is defeated. And this is even likely, as Agathon says, for it is likely that many things happen even contrary to likelihood.

The poet should take the chorus too to be one of the actors, and to be a part of the whole and to join in the action, not as in Euripides but as in Sophocles. As for the rest of the poets, the singing parts no more belong to their plot than to any other tragedy. That is why they sing interludes (*embolima*)—a sort of practice first started by Agathon. Yet how does singing interludes differ from fitting a speech, or a whole episode, from one drama into another?

19
Thought and Style of Speech

We have now discussed the other formal elements. It remains to discuss style of speech and thought.

As for thought, let what was said about it in the *Rhetoric*[67] be assumed; for it is special rather to that methodical inquiry. The things referred to thought are those that have to be produced through speech. And of these the parts are demonstration and refutation; the production of feelings (for example, pity, fear, anger, and others of this sort); and further, importance and unimportance. In the events too it is clear that the poet must use some of the same formal elements when he needs to make things piteous or fearful, important or likely, except that there is this much difference, namely, that in the latter case things must be evident without instruction, while in the former case things must be produced in the speech by the speaker and based on the speech. For what would be the work of the speaker if the things he needs to say are evident even not through speech?

Where style of speech is concerned, one form of theoretical investigation is concerned with the modes of expression, knowing which belongs to the craft of delivery and to the person who possesses this sort of craft in its architectonic variety—for example, knowing what a command is, a prayer, a narration, a threat, a question, an answer, and anything else of this sort. But no criticism at all that is based on

65. In *Trojan Women* and *Hecuba*.
66. A puzzling reference, since no epic recounts her story, according to which her proud boast about the superiority of her fourteen children to Leto's two, Apollo and Artemis, led to their death at the latter's hands.
67. 1403a35–b1.

knowledge or ignorance of these things is worth taking seriously. For why would anyone take as an error the things Protagoras criticizes, namely, that Homer, while thinking he is expressing a prayer, is giving an order, since he says, "Sing, goddess, of the anger"? For bidding someone to do or not to do something, Protagoras says, is an order. Hence one must leave aside this theoretical knowledge as belonging to another craft and not to that of poetry.

20
Parts of Speech

Of speech (*lexis*) in its entirety the parts are these: element, syllable, connecting particle, conjunction,[68] name, verb, inflection, statement.

An element is an indivisible voiced sound, and not every one, but one from which a compound sound naturally comes about; for wild beasts too have indivisible voiced sounds, but none of those are what I mean by an "element." Of this voiced sound the parts are vowels, semivowels, and mutes. A vowel is what has an audible voiced sound produced without any application [of the tongue]; a semivowel is what has an audible voiced sound produced with an application (for example, *sigma* and *rho*); and a mute is what, produced with an application, has no audible sound by itself, but becomes audible when combined with an element that has sound (for example, *gamma* and *delta*).

Elements differ in the shapes the mouth takes, but also in the places [from which they are produced], in the presence or absence of aspiration, in being long or short, and in having acute, grave, or intermediate pitch. Theoretical knowledge about each of these properly belongs to the craft of versification.

A syllable (*sullabê*) is a non-significant voiced sound composed of a mute and a voiced element; for in fact *gamma rho* is a syllable[69] without an *alpha* and also with an *alpha*, *gamma rho alpha*. But, again, theoretical knowledge of these differences belongs to the craft of versification.

A connecting particle (*sundesmos*) is a non-significant voiced sound that neither prevents nor causes the production of a single significant voiced sound from several voiced sounds, [and is naturally placed either at the extremities or in the middle,] **1457ª1** which it is not fitting to place by itself at the start of an account—for example, *men*, *dê*, *toi*,[70] *de*. Alternatively, it is a non-significant voiced sound that from more than one voiced but significant sounds naturally produces a single significant voiced sound. {For example, "about," "concerning," and the rest.}[71]

68. Reading ἄρθρον before ὄνομα rather than after ῥῆμα.
69. Reading συλλαβὴ καὶ.
70. These particles convey nuances that are captured in English in different ways in different contexts. Reading δή τοί.
71. Transposed from 1457ª7–8.

An *arthron*[72] is a non-significant voiced sound that makes clear the start of a statement, its end, or its division.[73]

A name (*onoma*) is a composite significant voiced sound, without a reference to time, no part of which is significant by itself; for in double names we do not use any part as significant by itself—for example, in "Theodorus," "dorus" is not significant.

A verb (*hrêma*) is a composite significant voiced sound, involving a reference to time, no part of which is significant by itself, just as in the case of names; for "human being" or "white" does not signify a time, whereas "walks" or "walked" additionally signify, in the one case, the present time, in the other, the past.

An inflection (*ptôsis*) of a name or verb is either with regard to the part that signifies case—*of* him [genitive], *for* him [dative], and things of that sort; or with regard to the part that signifies number (for example, human *beings*, or human *being*); or with regard to the sorts of delivery (for example, a question, a command); for "Did he walk (*ebadisen*)?" or "Walk! (*badize*)" is an inflection of the verb with respect to these forms.

A statement is a composite significant voiced sound, some parts of which are significant by themselves; for not every statement is composed of verbs and names—for example, the definition of human being [as featherless biped animal].[74] On the contrary, it is possible for there to be a statement without verbs. However, a statement will always have a part that signifies something—for example, "Cleon" in "Cleon walks." And a statement is one statement in two ways: either by signifying one thing or by consisting of several things through conjunction—for example, the *Iliad* is one through conjunction, whereas that [giving the definition] of human being is so by signifying one thing.

21
Forms of Names (Nouns)

Of the forms of names, some are simple (by "simple" I mean not composed of parts that are significant—for example, "earth"), others double. Of the latter, one is composed of a significant part and a non-significant part, except that within the name these are not significant and non-significant; the other is composed of parts that are significant. There can also be triple, quadruple, even multiplex names—for example, many amplified names,[75] such as *Hermokaikoxanthos*.[76]

1457b1 Every name, however, is either prevalent, exotic, a metaphor, an ornament, made-up, lengthened, shortened, or altered.

72. It is unclear which part of speech Aristotle is defining. Later the term meant "article."
73. Omitting ἢ φωνὴ . . . μέσου.
74. *Int.* 17a11–12.
75. Reading μεγαλειωτῶν.
76. Perhaps the fusion of the names of three rivers.

By a "prevalent" name I mean one a given group would use, and by an "exotic" name one that other groups would. So it is evident that the same name can be both prevalent and exotic, although not for the same people; for *sigunon* ("spear") is prevalent for the Cypriots, but exotic for us.

A metaphor is the application to something of a name belonging to something else, either from kind to form, from form to kind, from form to form, or by analogy. By "from kind to form" I mean, for example, "here stands my ship";[77] for being moored is a sort of standing. By "from form to kind" I mean, for example, "Odysseus in truth did ten thousand noble deeds";[78] for ten thousand is many, and Homer uses it here instead of "many." By "from form to form" I mean, for example, "having drained out his soul with bronze" and "having cut with long-edged bronze"[79] [a bowl to drain out water]; for here the poet calls cutting "draining" and draining "cutting"; for both are a sort of removal.

By "analogy" I mean when the second is to the first as the fourth is to the third [b : a :: d : c]. For the poet will say the fourth [d] in place of the second [b], or the second [b] in place of the fourth [d]. Sometimes too poets add something that is related to the substituted term. I mean, for example, that the wine-saucer is related to Dionysus as the shield is to Ares. And therefore a poet will say that a wine-saucer is "the shield of Dionysius" and a shield "the wine-saucer of Ares."[80] Or as old age is related to life, so the evening is related to day. And therefore a poet will say that evening is "the old age of day"[81] (or as Empedocles does), or call old age "the evening of life,"[82] or "the sunset of life."[83]

In some cases, there is no established name for one of the terms of the analogy, but nonetheless they will be expressed in the same way. For example, to let go of seed is to "sow" it, whereas to let go from the fire of the sun is nameless. But it stands in the same relation to the sun as sowing does to the seed. That is why the poet says "sowing the god-created fire."[84] It is possible to use this mode of metaphor also in another way: having called something by a name that belongs to something else, to deny something that properly belongs to it—for example, if a poet said not that a shield is a "wine-saucer of Ares," but a "wineless wine-saucer."

{. . .}[85]

77. Homer, *Odyssey* 1.185, 24.308.
78. *Iliad* 2.272.
79. Empedocles B138, B143 DK.
80. Timotheus, Fr. 21 Page.
81. B152 DK.
82. Alexis, Fr. 228 Kock.
83. Plato, *Laws* 770a.
84. Source unknown.
85. There is a lacuna in the text at this point, perhaps to be filled with a definition of ornament.

A made-up name is one that, being wholly unused by anyone, is given by the poet himself, for it seems that there are some names of this sort—for example, "sprouters" for horns, and "prayer-man" for priest.

As for lengthened or shortened names, the former is one that uses a longer vowel than the one properly belonging to it, or an inserted syllable. A name is shortened if something is removed from it. A lengthened one, for example, is *polḗos* for *polḗos* ("of a city"), and *Pêlḗiadeô* for *Pêlḗidou* ("son of Peleus"); a shortened one is, for example, *kri* [for *krithê*] ("barley"), *dô* [for *dôma*] ("house"), and [*ops* for *opsis*] in "from a pair of eyes a single vision (*ops*) comes."[86]

An altered name is when the poet leaves part of the thing doing the naming as it is but makes up some of it—for example, [*dexiteron* ("rightward")] for *dexion* ("right") in "by her rightward (*dexiteron*) breast."[87]

Of names themselves, some are masculine, some feminine, some neuter. Masculine names are those that end in *nu*, *rho*, or *sigma*, and in those letters composed with *sigma* (there are two of those: *psi* and *xi*). Feminine names are those that end in the vowels that are always long, that is, in *êta* or *ômega*, or, of those that can be lengthened, in *alpha*. So it turns out that there is an equal number of letters for masculine and feminine names to end in; for *ps* and *ks* are composites [of *sigma*]. No name ends in a mute or in a vowel that is [always] short. And in *iota*, only three end—*meli* ("honey"), *kommi* ("gum"), and *peperi* ("pepper")—and in *upsilon*, five—*pôu* ("fleece"), *napu* ("mustard"), *doru* ("spear"), *gonu* ("knee"), and *astu* ("town").[88] Neuter nouns, for their part, end in the same ones, and in *alpha*, *nu*, *rho*,[89] and *sigma*.

22
Virtue of Style of Speech

Virtue of style of speech consists in being perspicuous and not low. And the most perspicuous is that composed of prevalent names; but it is low. An example is the poetry of Cleophon, and of Sthenelus. On the other hand, a style that makes use of unfamiliar names is dignified and removed from the prosaic. By "unfamiliar" I mean exotic, metaphor, lengthening, and everything that is contrary to what is prevalent. But if someone were to make all the names be of this sort, the result will be either a riddle or gibberish: if composed of metaphors, a riddle; if of exotic names, gibberish. For the very form of a riddle is to combine impossibilities in stating things that are the case. This cannot be done with a combination of the other sorts of names, but is possible with a combination of metaphors—for example, "I saw a man gluing bronze

86. Empedocles, B88 DK.
87. Homer, *Iliad* 5.393.
88. Reading τὸ πῶυ τὸ νᾶπυ τὸ γόνυ τὸ δόρυ τὸ ἄστυ.
89. Reading καὶ α . . . καὶ ρ.

onto a man using fire,"[90] and others of the same sort. But things composed of exotic names are gibberish. The style of speech, therefore, must be somehow a mix of these; for the first—for example, exotic name, metaphor, ornament, and the other forms mentioned—will produce what is not prosaic and not low either, while the prevalent name will produce perspicuousness.

In no small part the lengthenings, abbreviations, and alterations of names contribute to perspicuousness and non-prosaicness; for, because of their variation from what is prevalent, since they are contrary to what is customary, they will produce what is non-prosaic, but because of their share in what is customary, they will produce perspicuousness. So it is not correct to criticize this mode of speaking and ridicule the poet[91] for it, as some have done, for example, the elder Eucleides, on the supposition that it is easy to produce poetry if one is allowed to lengthen names as much as one wishes, composed as lampoons in such a style of speech, "I saw Epichares walking Marathon-ward (*Marathônade*)" [for "I saw Epichares walking to Marathon"] and "not stirring up his hellebore (*ellêbôron*)."[92] Using this mode in an obvious way, then, is ridiculous. Moderation is a common requisite of all the parts; for in fact a poet would also produce the same result by using metaphors, exotic names, and the other forms in an unfitting way and to deliberately produce what is ridiculous. **1458^{b}1**

How much difference what is fitting makes in the case of epic poems is to be seen by putting [prevalent] names into the verse. And in the case of exotic names, metaphors, and the other forms, if one were to substitute the prevalent names [for them], one would see that what we are saying is true. For example, when Euripides composed the same iambic verse as Aeschylus, substituting only one name, an exotic one, in place of a customary prevalent one, it is evident that the one verse is nobly beautiful, the other shabby. For while Aeschylus in his *Philoctetes* wrote "the cancer that eats the flesh of my foot,"[93] Euripides substituted "feasts on" for "eats."[94] Also, in "now I am a paltry man, niddering, and unseemly,"[95] if someone substituted the prevalent names and wrote, "now I am a little man, weak, and ugly." And "offering a misshapen stool and a paltry table"[96] versus "offering a bad stool and a little table." Or "the shores resound" versus "the shores scream."[97]

Further, Ariphrades ridiculed the tragedians because they used things which no one would say in speaking—for example, "from the house away" instead of "away

90. *Rh*. 1405^{b}1–5.

from the house," or "of thine," "mine own,"[98] or "Achilles round" instead of "around
1459a1 Achilles," and all other things of this sort. But it is because in fact such expressions are not among the prevalent ones that they produce what is not prosaic in the style of speech. But Ariphrades was ignorant of this.

But while it is important that each of the things mentioned be used in a fitting way, including double names and exotic ones, to be skilled with metaphors is by far the most important. For it alone cannot be acquired from anyone else and is a sign of good natural cleverness; for to use metaphors well is to see likeness.

Of names, double ones are most fitting for dithyrambs, exotic ones for heroic verses, and metaphors for iambic verses. In fact, in heroic verses all the things just mentioned are useful, whereas in iambic ones, because these most of all imitate speech, those names are fitting that one can use in prose speeches too. And prevalent name, metaphor, and ornament are things of this sort.

Where tragedy is concerned, and imitation in the medium of acting, then, let what has been said be enough for us.

23
Epic: Plot

Where the craft of narration and imitation in the medium of verse is concerned, on the other hand, it is clear that, just as in tragedies, the poet should compose plots that are dramatic (that is, about one unified action that is whole and complete, having a starting-point, middle points, and end), in order that, like one unified and whole animal, it may produce the pleasure proper to it, and not compositions that are like histories, in which it is necessary not to exhibit a single unified action, but rather a single time, with all that happened during it to one person or to several people, each event having a random relation to the others. For just as at the same time as the sea battle at Salamis happened, the battle against the Carthaginians in Sicily also happened, but did not contribute anything to the same end, so too in successive times one thing sometimes comes about after another, though from these no single end comes about.

Pretty much all of the poets, however, do this. That is why, as we said already,[99] Homer appears divinely inspired compared to the others, in that he did not attempt to make a poem of the war as a whole, although it had a starting-point and an end; for the plot would have been too long and not easily seen as a whole, or, if moderated in length, too complex in its variety. But as things stand, selecting a single part, he has used many parts as episodes, for example, the catalog of ships and other episodes, with which[100] he diversifies his poem. The other poets compose their poems about a

98. Sophocles, *Oedipus at Colonus* 986.

100. Reading οἷς.

single person, a single time, or a single multipart action—for example, the one[101] who composed the *Cypria* and the *Little Iliad*. Accordingly, from each of the *Iliad* and the *Odyssey*, only one or at most two tragedies are made, whereas many are made from the *Cypria*, and more than eight from the *Little Iliad*—for example, the *Judgment of Arms*, *Philoctetes*, *Neoptolemus*, *Eurypylus*, *Beggary*, *Spartan Women*, *Sack of Troy, Departure of the Ships*, *Sinon,* and *Trojan Women*.[102] **1459ᵇ1** 5

24
Epic and Tragedy Compared, Homer

Further, epic must include the same forms as tragedy, for it is either simple or complex, expressive of character or full of suffering. And its parts, except for melody-composition and spectacle, are the same; for, in fact, it needs reversals, recognitions, and sufferings. Further, the thoughts and the style of speech must be nobly beautiful. 10

Homer was both the first to use all these and to do so in a fully adequate way. For in fact of his two poems each is composed in each of the two ways[103]—the *Iliad* is simple and full of suffering, while the *Odyssey* is complex (in fact, recognition permeates it) and expressive of character. In addition to this, Homer has surpassed everyone[104] in style of speech and thought. 15

Epic differs, though, with respect to the length of its composition and in its meter.

Now, of its length, the limit we stated[105] is adequate; for it must be possible for both the starting-point and the end to be within the range of one's vision. And this would be so if the compositions were shorter in length than the old epics, but were to extend to the length of the series of tragedies presented for a single hearing. In relation to the considerable extension of its length, however, epic has a special affection, due to the fact that in tragedy it is not possible to imitate many parts [of the plot] as being done in action at the same time, but only the part performed on the stage and by the actors. In epic, by contrast, because it is narration, it is possible to compose many parts that are accomplished at the same time, and due to these, provided they properly belong in it, the weightiness of the poem is increased. So epic has this advantage when it comes to magnificence, change for the listener, and interspersing 20 25

101. Unknown.

102. *Judgment of Arms* is by Aeschylus; *Philoctetes* by Sophocles and (not extant) by Euripides; *Neoptolemus* by Nicomachus; *Eurypylus*, *Spartan Women*, and *Sinon* (the person left behind by the Greeks to persuade the Trojans to accept the Trojan Horse) by Sophocles; the topic of *Beggary* (not extant) is Odysseus disguised as a beggar; and *Trojan Women* by Euripides. 105. 1451ᵃ9–15.

dissimilar episodes; for similarity, by quickly satiating [the spectator], makes tragedies fail [when staged].

As for its meter, from experience the heroic one has been found fitting. For if anyone were to compose a narrative imitation in one or more of the other meters, it would be manifestly unfitting; for heroic verse is the most stately and most weighty of the meters. That is why it is most receptive of exotic names and metaphors; for narrative imitation also exceeds the others also in this.[106] Iambic [trimeter] and [trochaic] tetrameter, on the other hand, are suited to movement, the second to dancing,[107] the first to action. It would be yet stranger if someone mixed them, as Chaeremon did. That is why no one has composed a long composition in any meter other than the heroic. But, as we said,[108] the nature itself [of epic] teaches poets to choose what is fitting for it.

Homer deserves to be praised for many things, and especially because, among the [epic] poets, he alone is not ignorant of what the poet must do. For the poet himself must say as little as possible; for it is not in virtue of this that he imitates. The others contend for the prize themselves throughout the poem, but imitate little and seldom. But Homer, after a short preamble, brings on a man, a woman, or something else,[109] and none of them characterless, but all of them possessing character.

In tragedies, the poet should produce the element of wonder, but in epic the non-rational, through which the element of wonder results par excellence, is more possible, because one does not look at the person doing the action. For the events pertaining to the pursuit of Hector would appear ridiculous on the stage, with the Greeks standing still and not pursuing him, and Achilles forbidding them to do so, but in the epic they are unnoticed. The element of wonder, though, is pleasant. A sign of this is that everyone exaggerates when they narrate a story, supposing that they make themselves agreeable.

Also, Homer above all taught the other poets to speak falsehoods as they should. This is by fallacious inference. For, if whenever A is or comes to be, B is or comes to be, people think that if B is, A is or comes to be. But this is false. That is why, if A is false, but if A is or comes to be, necessarily B is or comes to be, the poet should add B. For because we know that B is true, our soul fallaciously infers that A is too. A paradigm case of this is the Bath Scene.[110]

Also, one must deliberately choose likely impossibilities in preference to unpersuasive possibilities, and stories must not be composed of non-rational parts—or rather to the greatest possible extent they should contain nothing non-rational. Or, failing that, it must be outside the frame of the plot, like Oedipus not knowing how Laius died. But it must not be in the drama, like the people reporting on the Pythian

110. Homer, *Odyssey* 19.386–475.

Games in the *Electra*,[111] or the non-speaking man who comes from Tegea to Mysia in the *Mysians*.[112] So, to say that the plot would otherwise have been ruined is ridiculous; for plots of this sort must not be composed to start with. But if one is posited, and appears comparatively reasonable, even something absurd must be admissible,[113] since even the non-rational bits in the *Odyssey* about the putting ashore of Odysseus[114] would clearly be intolerable if an inferior poet had composed them. But as things stand, Homer hides the absurdity by embellishing it with the other good things.

But the poet must take special pains with the style of speech in the idle parts, that is, the ones expressive neither of character nor of thought; for, contrariwise, a too brilliant style of speech obscures both characters and thoughts.

25
Epic: Errors and Problems

Where problems and their resolutions are concerned, it should become evident how many there are and of what form, if we get a theoretical grasp on them as follows.

For since the poet is engaged in imitation, like the painter or any other maker of images, it is necessary that he always be imitating one of three things: things as they were or are; things as they are said to be or seem; or things as they should be.

He expresses these things by means of a style of speech in which there are exotic names, metaphors, and many modifications of speech; for we grant these things to poets.

In addition to this, there is not the same [standard of] correctness in the craft of politics as in that of poetry, nor in any other craft as in poetry. And in the craft of poetry itself error is of two sorts: intrinsic error and coincidental error. For if the poet deliberately choses to imitate correctly, but has erred due to incapacity,[115] the error is intrinsic to the craft itself. But if he deliberately chose to imitate incorrectly, and he represented the horse with both right legs thrown out in front at the same time, and either he made an error in the relevant craft (for example, in medicine or another craft of whatever sort) or he has made something impossible,[116] the error is not in the craft of poetry itself.

So one must resolve the criticisms contained in the problems by investigating them on the basis of these considerations.

First, then, the ones raised against the craft itself. Impossibilities have been produced: an error was committed. But this is correctly done if it attains the end of

111. Sophocles, *Electra* 660–763.
112. Perhaps by Aeschylus.
113. Reading ἄν δὲ . . . ἄτοπον.
114. 13.116–125.
115. Reading ὀρθῶς, ἥμαρτε δὲ δι'.
116. Reading ἢ ἀδύνατα πεποίηται.

the craft itself (for the end has been stated), namely, if in this way it makes this part or another part more surprising. An example is the pursuit of Hector. If, however, the end either could have been better obtained, or no less obtained, in accord with the craft concerned with these matters, to commit the error is not correct;[117] for, if possible, no errors at all should be made.

Further, of what sort is the error, the sort in accord with the craft or in accord with something else and coincidental? For the error is less if the artist did not know that a female deer has no horns, than if he painted non-imitatively.

In addition to these points, if the poet is criticized because he is imitating things that are not true, perhaps [the answer is that] it is as they should be, as, for example, Sophocles said that he made people as they should be, Euripides as they are. This is the way in which the criticism must be resolved.

But if neither of these ways works, then [try] the fact that people say so—for example, the [stories] about the gods. For perhaps these are neither better said this way nor true, but perhaps as they seemed to Xenophanes;[118] however, people do tell them.

1461ᵃ1 And some things, though perhaps not better, were once this way—for example, the ones having to do with weapons: "their spears upright on their butt-spikes";[119] for this was the custom, then, as it is even nowadays among the Illyrians.

As for whether something is said or done nobly or not nobly, one must investigate not only the thing itself that was done in action or said, looking to see whether it is excellent or base, but also the person doing the action or saying it, and to whom, when, by what means, and for the sake of what—for example, for the sake of a greater good, in order to be brought about, or for the sake of a greater evil, in order that it be averted.

Some problems must be resolved by looking to the style of speech—for example, to an exotic name in "the *ourêas* first";[120] for perhaps by *oureus* Homer means not mules but guards.[121] And by Dolon "who was in form bad,"[122] not that his body was ill-proportioned, but that his face was ugly, for Cretans call one who is fair of face "well-formed"). And by "mix it purer,"[123] not serve undiluted wine, as for drunkards, but mix it faster.

Some problems must be resolved by appeal to metaphor—for example, "Everyone, both gods and men, slept all night long," when at the same time he says, "He would

117. Reading ἡμαρτῆσθαι.
118. B14–16, 34 DK. I.e., false.
119. Homer, *Iliad* 10.152.
120. Homer, *Iliad* 1.50.
121. Homeric *oureús* may be either an Ionic form of *oreús* meaning "mule" or of *horeús* meaning "guard."
122. *Iliad* 10.316.
123. *Iliad* 9.202.

gaze across the Trojan plain, wondering at the din of pipes and panpipes";[124] for "all" is said metaphorically in place of "many," for all is a sort of many. And "alone has no share"[125] is metaphorical; for what is best known is alone.

Some problems must be resolved by appeal to accentuation, as Hippias of Thasos[126] resolved, "we grant (*dídomen*) him the fulfillment of his prayer" [by reading *didómen* ("let the dream grant his prayer")][127] and ["this is not (*ou*) rotted by the rain," by reading] "this part of it (*hou*) is rotted by the rain."[128]

Some by punctuation—for example, Empedocles,[129] "and suddenly grew mortal those learned before to be immortal and pure unmixed before" [by reading "and suddenly become mortal, those learned before to be immortal, and pure, unmixed before"].

Some problems must be resolved by ambiguity—"more night had passed."[130] "More" is ambiguous [between "more than a certain part" and "the greater part"].

Some problems must be resolved by habit in style of speech. As people speak of water mixed with wine as "wine," so Homer composed "a greave of new-wrought tin,"[131] and as they speak of iron workers as "bronze-smiths," so he speaks of Ganymede as "the wine-pourer of Zeus," though gods do not drink wine [but nectar]. But this could also be a metaphor.

Whenever a name seems to signify something contradictory, one must also look to see how many ways it might signify in the passage—for example, "the bronze spear was stopped there," one must look to see how many ways it was possible for it to be prevented [from piercing Achilles' shield], this way or that way, so that one would best understand it. This flies straight in the face of what Glaucon describes by saying that some people non-rationally pre-assume something and, coming to a determination of it themselves, deduce the consequence, and criticize the poet (as if he had said the thing that seems so to them) if he contradicts what they think. This is what happened in the case of Icarius. For people think that he is a Spartan. [They deduce,] then, that it was strange that Telemachus did not meet him when he went to Sparta. But perhaps it is as the inhabitants of Cephalonia say; for they say that Odysseus took a wife from among them, and that her father was Icadius, not Icarius. And it is likely[132] that the problem is due to this error.

124. *Iliad* 10.1 (confused with 2.1), 10.11–13.
125. *Iliad* 18.489 (= *Odyssey* 5.275), with reference to the never-setting Ursa Major.
126. Identity uncertain.
127. The passage about Agamemnon's dream is *Iliad* 2.1–34, but the words quoted are spoken by Poseidon at 21.297. If one reads *dídomen*, Zeus himself has given a false promise.
128. Homer, *Iliad* 23.328. People thought it strange that Homer would point out that an oak or pine stump was not rotted.
129. B35 DK.
130. Homer, *Iliad* 10.252–253: "More night had passed, two thirds, but a third is still left."
131. *Iliad* 21.592. Bronze is roughly 10 percent tin and 90 percent copper.
132. Reading εἰκὸς ἐστιν.

In general, the impossibility must be referred either to poetic composition, to the better, or to belief. In relation to composition, a convincing impossibility is more choiceworthy than an unconvincing possibility. And perhaps[133] people of the sort Zeuxis painted are impossible. But it is to the better; for paradigms must be superior.

Non-rational things, on the other hand, must be referred to what people say, or by showing that sometimes they are not non-rational; for it is likely that things will happen even contrary to likelihood.

One must investigate things said in contradictory ways just like refutations in arguments, to see whether the same thing is said in relation to the same thing and in the same way, so that they must be resolved[134] either by reference to what the poet himself says, or to what a practically wise person would assume.

Criticism both of non-rational things and of depraved ones is correct when, with no necessity whatsoever to do so, the poet uses what is non-rational, as Euripides uses Aegeus,[135] or wickedness, as Euripides uses that of Menelaus in the *Orestes*.[136]

The criticisms people bring forward, then, are of five forms: that things are impossible, non-rational, harmful, contradictory, or incorrect with respect to the craft. And resolutions must be investigated on the basis of the number of considerations just mentioned. There are twelve.

26
Epic versus Tragedy

One might be puzzled, though, as to whether epic imitation is better or tragic imitation. For if the less unrefined imitation is better, and the less unrefined is always directed to the better spectators, it is very clear that the one that imitates anything and everything is unrefined; for on the assumption that the spectators will not perceive things unless [the actor] himself adds something, a great deal of movement is set going, like inferior pipe players whirling around if they have to imitate a discus throw, or dragging around the chorus leader if playing the *Scylla*.[137] So then, tragedy is of this sort, as earlier actors also thought of later ones as being; for Mynniscus used to call Callippides a monkey, on the grounds of his being far too excessive [in his movements and gestures], and such too was the belief about Pindarus. And as **1462a1** the later ones stand to them, so the whole craft of tragedy stands to epic. They say, then, that epic is directed to decent spectators, who have no need of showy gestures,

133. Reading καὶ ἴσως ἀδύνατον.
134. Reading λυτέον.
135. *Medea* 663–758.
136. 1454a28–29.
137. Dithyramb by Timotheus.

whereas the craft of tragedy is directed to base ones. If, then, it is unrefined, it is clear that it would be worse.

Now the first point to make is that the charge is not against the craft of poetry, but against the craft of delivery, since it is possible to overact one's part with signals both in reciting an epic, precisely as Sosistratus did, and in singing, precisely as Mnasitheus of Opus used to do. Next, not all movement is to be rejected, unless dance is to be as well, but only that of base people, precisely as Callippides too was criticized for doing, and others nowadays are, on the grounds of imitating women who are not free. Further, tragedy can produce its own effect even without movement, just as epic does; for it is evident from reading it of what sort it is. If tragedy is superior in other respects, then, there is no necessity for this to belong to it.

Next point. Tragedy is superior because it has everything that epic has—for it is even permissible for tragedy to use epic's meter—and further, it has music and spectacle[138] as no small part of it, through which very vivid pleasures are created. Accordingly, it possesses vividness in reading as well as in performance. Further, because the end of the imitation is achieved in a shorter length; for what is more concentrated is more pleasurable than what is diluted with a large admixture of time (I mean, for example, if someone were to set the *Oedipus* of Sophocles in as many lines of verse as the *Iliad*). Further, the epic poets' imitation is less one and unified (a sign of this is that from any epic imitation whatsoever several tragedies are generated, so that if they compose one unified plot, it will appear curtailed if it is presented briefly, or watery if it is guided by the length that is characteristic of the meter). By "less one and unified" I mean, for example, if it is composed of several actions, just as the *Iliad* and the *Odyssey* have many parts of this sort, which have magnitude even by themselves. Yet these poems are composed, as far as is possible, in the best way, and are, to the greatest extent possible, imitations of one unified action.

1462^{b}1

If, then, tragedy is superior in all these respects, and further with respect to the work of the craft [of poetry] (for tragedy and epic must produce not a random pleasure but rather the one mentioned), it is evident that it would be superior to epic, as attaining the end [of the craft] to a higher degree than epic does.

Where tragedy and epic are concerned, then, both themselves and their formal elements and parts, how many they are and how they differ, and what the causes are of their being well done or not, and where criticisms and resolutions are concerned, let this much be said.[139]

139. F167 includes the fragments of the lost *Poetics* Book 2.

THE ATHENIAN CONSTITUTION*

(A) Fragments of the Lost Beginning (f1–f6)

f1

The Epitome of Heraclides 1

The Athenians initially employed kingship, and when Ion settled among them they were first called "Ionians." Pandion, who was king after Erechtheus, distributed the rule among his sons, and these continually engaged in faction.

Harpocration (α 194 Keaney): *Ancestral Apollo Is "the Pythian"*

This is a title of the god; there are many others. The Athenians have been communally honoring Apollo as "ancestral" since Ion. For when he settled Attica, as Aristotle says, the Athenians were called "Ionians" and Apollo was named their "ancestral" god.

Scholium to Aristophanes, Birds 1527: *Where "Ancestral" Comes From*

The Athenians honor Ancestral Apollo, since Ion, the Athenian polemarch ("war commander"), was born from Apollo and Creusa the wife of Xuthus.

f2

Patmos Lexicon (Lexica Graeca Minora, p. 162): Gennêtai

Long ago, before Cleisthenes had managed matters concerning the tribes,[1] the multitude of the Athenians were divided into farmers and craftsmen, and there were 4 tribes of these. Each of the tribes had 3 parts, which they called "clans" and "thirds (*trittues*)"; each of these consisted of thirty families (*genê*); and each family was composed of thirty men, those assigned to the family, who were called "elite (*gennêtai*)." From these they chose by lot the priesthoods belonging to each, such as the Eumolpidae, the Ceryces,[2] and Eteobutadae, as Aristotle records in the *Athenian Constitution*, saying the following: "4 tribes of them were put together, imitating the seasons in the years; each tribe was divided into three parts, so that in all there were twelve parts, like the months in the year, and they were called 'thirds' and 'clans'. In the clans, thirty families were arranged, as the days are in the month. The family was composed of thirty men."

* Translated by C. D. C. Reeve. Text: P. J. Rhodes, *The Athenian Constitution Written in the School of Aristotle* (Liverpool, 2017).

1. 20–21.
2. 39.2.

Scholium on Plato, Axiochus 371e: Gennêtê(i)

Aristotle says that when the whole multitude at Athens were divided into the farmers and craftsmen there were 4 tribes of them, and there were three parts of each tribe, which they call "thirds" and "clans," and of each of these there were thirty families, and each family was composed of thirty men. These men who are arranged in the families they call "elite."

Harpocration (τ 34 Keaney): *Trittys*

A *trittys* is the part that corresponds to the one-third of the tribe; for the tribe is divided into three parts, thirds, peoples (*ethnê*), and clans, as Aristotle says in his *Athenian Constitution*.

f3

The Epitome of Heraclides 1 (continues)

Theseus made a proclamation and brought these men together on the basis of an equal and similar share.

Plutarch, Theseus 25.1–3

Wishing to increase the city still more, he summoned them all on equal terms, and "Come hither all you people" was a proclamation of Theseus, they say, when he established a whole people (*pandêmia*). But he did not allow the democracy to become disorderly or mixed due to the influx of an indiscriminate multitude of people, but first he set apart the aristocrats, the farmers, and the craftsmen. He granted to the aristocrats to know about divine things, to supply the officials, and to be teachers of laws and interpreters of holy and sacred things, but he established them in a sort of equality with the other citizens: the aristocrats seeming to be superior in reputation, the farmers in use, and the craftsmen in numbers. That he was the first to incline to the mob, as Aristotle says, and renounce monarchical rule, Homer too seems to attest in "the catalog of ships,"[3] calling only Athenians a "people (*dêmos*)."

f4

The Epitome of Heraclides 1 (continues)

[Theseus] came to Scyros and died there, pushed down the cliffs by Lycomedes, who feared that he would make the island his own. Later, after the Persian Wars, the Athenians transported his bones [back to Athens].

3. *Iliad* 2.494–759.

Vatican Scholium on Euripides, Hippolytus 11: Of Holy Pittheus

Aristotle reports that Theseus came to Scyros for prospecting, which made perfect sense because of his kinship with Aegeus, but died after being pushed down the cliffs, since Lycomedes the king was afraid of him. . . . After the Persian Wars the Athenians, in accord with an oracle, carried his bones off [back to Athens] and buried them.

f5

The Epitome of Heraclides 1 (continues)

After the Codridae,[4] kings were no longer chosen, because they seemed to be given to luxury and to have become effeminate. But Hippomenes, one of the Codridae, wished to rebut the slander: when he caught a seducer with his daughter Leimone, he killed him by yoking him under his chariot, and shut her up with the horse until she died.

f6

The Epitome of Heraclides 2 (continues)

Because of the tyranny, those with Cylon fled to the altar of the goddess,[5] but were killed by those around Megacles. And those who did this they drove out as accursed.[6]

(B) Cylon (1)

1.1 . . . with Myron, chosen on an aristocratic basis, prosecuting, and swearing an oath over sacred sacrificial animals. When they had been condemned as accursed, they themselves[7] were cast out of their tombs, and their family went into exile, permanent exile. On this basis, Epimenides the Cretan purified the city.

(C) Between Cylon and Solon (2–4)

2.1 After that, faction occurred for a long time between the notables and the multitude. |2.2| For their constitution was oligarchic in all other respects, and the poor—themselves, their children, and their wives—were enslaved to the rich. And they were called "dependents (*pelatai*)" and "sixth-parters (*hektêmoroi*)," because they worked the

4. Codrus and his family.
5. Athena.
6. Cylon and his supporters attempted to seize the Acropolis. They failed and fled as suppliants to the altar of Athena. Megacles, together with others, killed them, incurring a curse on his family, the Alcmaeonids, for harming those under divine protection.
7. The Alcmaeonids.

fields of the rich for this payment.[8] All the land was owned by a few men. And if they did not make their payments, they and their children were subject to seizure. And loans were made to all on the security of the person up until Solon: he was the first champion of the people. |2.3| The harshest and bitterest aspect of the constitution for the many was enslavement, although they were discontented with other aspects too. For there was (one might almost say) nothing in which they had a share.

3.1 The order of the ancient constitution before Draco was of the following sort. They appointed the officials in accord with aristocratic birth and wealth. At first they were officials for life, after that for ten years. |3.2| The greatest and first of the offices were those of the king (*basileus*), the polemarch ("war commander"), and the archon. Of these, the first was that of the king; for it was ancestral. Second, the office of polemarch was established in addition, because some of the kings were fainthearted in military matters, which is why they also summoned Ion[9] when the need arose. |3.3| The last office was that of the archon. Most say that this came into being in the time of Medon, but some in the time of Acastus. The latter cite as proof the fact that the nine archons swear that they will abide by their oaths as in the time of Acastus, suggesting that under him the descendants of Codrus gave up the office of king in exchange for the grants made to the archon. Whichever way this was, it makes little difference for the chronologies. A sign that this was the last of the offices is also that the archon managed none of the ancestral matters, as the king and the polemarch do, but simply the additional ones. This is also why it has lately become the major office, increased by the additional ones. |3.4| The thesmothetae[10] were elected many years later, when the officials were already elected annually, to write down the statutes (*thesmia*) and preserve them for judging disputes. That is why this office alone was never for more than a year. |3.5| In time, then, this is how the offices preceded each other. The nine archons were not all together, but rather the king occupied what is now called the "Bucolium," near the Prytaneum (a sign of this is that still today the union of the king's wife and marriage with Dionysus take place there), the archon occupied the Prytaneum, and the polemarch the Epilyceum, which was previously called the "Polemarcheum," but after Epilycus rebuilt and restored it when he served as a polemarch, it was called the "Epilyceum." The thesmothetae occupied the Thesmotheteum. In the time of Solon, however, they all came together in the Thesmotheteum. They had absolute authority to judge suits, and not, as now, to hold only a preliminary investigation. As regards the offices, then, this is the way it was. |3.6| The council of the Areopagus had the position of watching over the laws, but it also managed most and the most important things in the city, with authority both to punish and fine all those who are disorderly. For choosing the archons was

8. I.e., one-sixth of their produce.
9. As polemarch.
10. 59, 63–65.

on the basis of aristocratic birth and wealth; from them the Areopagites were appointed. That is why this office alone of the offices has remained to be for life even now.

4.1 This is the outline of the first constitution. After that, in the archonship of Aristaechmus,[11] when not much time had passed, Draco set up his statutes. The way this was ordered was as follows. |4.2| Citizenship had been given to those provided with hoplite weapons. They elected the nine archons and the treasurers from those possessing unencumbered property worth not less than ten minas, the other officials, the lesser ones, from those provided with hoplite weapons, and the generals and cavalry commanders from those declaring unencumbered property of not less than a hundred minas, with legitimate children over ten years old by a lawfully wedded wife. These officials were required to take guarantors from the prytanes,[12] generals, and cavalry commanders of the previous year until they had undergone their inspections, accepting as guarantors 4 men from the same property class as the generals and the cavalry commanders in chief. |4.3| There was to be a council of four hundred and one men chosen by lot from those with citizenship. Both for this and for the other offices those over thirty drew lots, and the same man was not to hold office twice before all men had gone through; at this point they drew lots again from the start. If any of the councilors, when there was a session of the council or assembly, was absent from the meeting, if he was a five-hundred-bushel-man he paid three drachmas, if a cavalryman two, and if a yoke-man one.[13] |4.4| The council of the Areopagus was guardian of the laws and watched over the officials, so that they exercise their powers in accord with the laws. It was possible for anyone treated unjustly to make an indictment before the council of the Areopagus showing what law was broken by the injustice done to him. |4.5| Loans were made on the security of the person, as was said,[14] and the land was in the hands of a few men.

(D) Solon (5–12)

5.1 When that was the sort of order in the constitution, and the many were enslaved to the few, the people rose up against the notables. |5.2| Since the faction was strong and they had been set against each other for a long time, they together elected Solon as reconciler and archon,[15] and turned the constitution over to him, since he had written the elegy of which this is the start:

11. c. 621/0 BC.
12. 43–44.
13. 7.4.
14. 2.2.
15. 594/3 BC.

> I know, and pains lie within my heart,
> When I see the oldest land of Ionia
> Declining.[16]

In this poem he fights and disputes against each side on behalf of the other, and after that advises them jointly to cease the rivalry besetting them. |5.3| Solon was by nature and reputation one of Athens' first men, but by property and circumstances one of those in the middle,[17] as is agreed on other grounds, and as he himself attests in these poems, when he exhorts the rich not to be greedy:

> You must calm the strong passion in your hearts,
> You who have driven your way to an excess of many good things,
> And must place your great thoughts in moderate things. For neither will *we*
> Obey you, nor to *you* will all things be perfectly suited.[18]

And always he places the blame for the faction wholly on the rich. That is why at the start of his elegy too he says he feared "both love of wealth and arrogance," since it was because of these that the enmity had arisen.

6.1 When he was in control of affairs, Solon freed the people both in the present and for the future, forbidding lending on the security of the person, and he enacted laws and made cancellations of both private and public debts, which they call "the shaking-off of burdens (*seisachtheia*)," as they had shaken off the weight. |6.2| In regard to these matters some people try to slander him. For it so happened that when Solon was about to carry out the shaking-off of burdens, he mentioned it in advance to some of the notables. Then, as democrats say, he was outmaneuvered by his friends, or, as those who wish to slander him say, he himself also joined in. These men borrowed money, bought up a large quantity of land, and not long afterward, after the cancellation of debts occurred, grew rich. This they say was the origin of those who were later thought to be "rich from old money." |6.3| However, the account of the democrats is more persuasive. For it is not likely that a man who in the other respects was so moderate and community-minded, that when he could have outwitted the others by underhanded tricks and become tyrant of the city, instead put up with the hatred of both sides by placing what is noble and the safety of the city above his own greed, would sully himself in such petty and visible ways. |6.4| That he had this possibility is something that the diseased state of public affairs attests, that in his poetry he himself also mentions in many places, and that all the others agree with. We must think, then, that this charge is false.

16. Fr. 4a West.
17. *Pol.* 1296^{a}18–20.
18. Fr. 4c West.

7.1 He established a constitution[19] and also enacted new laws, and they stopped using the statutes of Draco except regarding homicide. They wrote up the laws on wooden pillars and set them up in the king's Porch, and everyone swore to use them. And the nine archons, when taking an oath at the stone,[20] promised to dedicate a gold statue if they transgressed any of the laws, which is the origin of their still swearing this oath today. |7.2| He locked in the laws for a hundred years, and arranged the constitution in the following way. |7.3| He divided [the people] by a property assessment into four property classes, just as they had also been divided before: the five-hundred-bushel-men, the cavalrymen, the yoke-men, and the hired laborers. And to hold the major offices he assigned men from the five-hundred-bushel-men, the cavalrymen, and the yoke-men: the nine archons, the treasurers, the sellers of city contracts (*pôlêtai*), the Eleven,[21] and the public treasury officials (*kôlakretai*), granting offices to each in proportion to the size of his wealth assessment. But to those in the class of hired laborers he assigned the assembly and the courts alone. |7.4| A man had to be classed as a five-hundred-bushel-man if he produced from his own property five hundred bushels both wet and dry; and men had to be classed as cavalrymen if they produced three hundred bushels—or, as some say, if they were able to keep a horse. As a sign of this they point to the name of the class, as deriving from this underlying fact, and the dedications of the ancients. For a statue of Diphilus is dedicated on the Acropolis, on which the following is inscribed:

> Anthemion dedicated this [statue] of Diphilus to the gods,
> Having changed the hired laborer class for the cavalryman's.

And a horse has been placed beside it, attesting that the cavalryman's class means this. However, it is more reasonable that it was determined by measures, as with the five-hundred-bushel-men. Classed as yoke-men were those producing two hundred bushels both [wet and dry]. The others were classified as hired laborers, sharing in no office. That is why even now, no one about to be assigned by lot to some office who is asked what his property class is would say "hired laborer."

8.1 He made the officials be chosen by lot from pre-selected ones that each of the tribes had pre-selected. Each tribe pre-selected ten men for the nine archonships, and from these they made the allotments; this is the origin of why it still remains the case that each of the tribes chooses by lot ten men, and then they choose by lot from these. A sign that he made appointments be chosen by lot from the assessment classes is the law about the treasurers, which they continue to use even now; for it tells them to choose by lot the treasurers from the five-hundred-bushel-men. |8.2| Solon, then, legislated in this way about the nine archons. In ancient times the council of the Areopagus summoned and judged for itself the one who was suitable for each of the offices, and

19. Discussed in *Pol.* 2.12.
20. 55.5.
21. *Pol.* 1322ª19–20.

appointed and dispatched him for the year. |8.3| There were four tribes as previously, and four tribal kings.[22] From each of the tribes three thirds were distributed, with twelve naucraries in each. The officials appointed to be in control of the naucraries were the naucrari,[23] assigned in regard to ongoing incomes and expenses. That is why in the laws of Solon too, which are no longer used, it is often written, "The naucrari are to exact," and "spend from the naucraric silver." |8.4| He made a council of four hundred, one hundred from each tribe, but he appointed the council of the Areopagus to guard the laws, just as it had earlier too been the overseer of the constitution, and it watched over the greatest number and the most important of the political matters. It called wrongdoers to account, since it had the authority both to fine and to punish, and carried the payments [of financial dues] up to the Acropolis, but did not write down the alleged cause for the calling to account; and it judged those conspiring for the dissolution of the democracy, with Solon legislating the law of indictment about them. |8.5| Seeing that the city was often factionalized, but that some of the citizens through idleness accepted whatever happened to occur, he passed a law special to them, that anyone who did not put his weapons at the disposal of one side or the other when the city was factionalized should be deprived of his citizen status and not participate in the city.

9.1 This, then, is how things stood regarding the offices. The following three seem to be the most democratic features of Solon's constitution. The first and greatest was not lending on the security of the person; second was the possibility for anyone who wished to seek vengeance for those who were done an injustice; and third, by which they say the people were above all strengthened, was the appeal to the court; for when the people have control over the vote,[24] they have control over the constitution. |9.2| Further, because his laws were not written simply or perspicuously, but were like the law about inheritances and heiresses,[25] there were necessarily many disputes and the court needed to arbitrate all public and private matters. Some think that he made his laws lack perspicuousness deliberately, so that the people would have the authority to judge. But this is not likely—probably it was because he was unable to circumscribe what was best in universal terms. For it is not just to speculate about what he wished on the basis of what occurs now, but rather on the basis of the rest of his constitution.

10.1 These, then, seem to be the democratic features of the laws that he enacted; and before his legislation, he made the cancellation of debts, and after that the increase in the measures, weights, and coinage. |10.2| For it was in his time that the measures were made greater than those of Pheidon, and that the mina, which previously had the weight of seventy drachmas, was filled up to one hundred. The ancient standard coin was the two-drachma piece. He also made weights corresponding to the coinage, with

22. 41.2, 57.4.
23. The etymology of the term suggests that it means something like "ship-chief."
24. Of guilty or not guilty.
25. 35.2.

sixty-three minas making up a talent, and the three minas distributed among the stater and the other weights.

11.1 After he had arranged the constitution in the way stated, people kept approaching and troubling him about the laws, blaming him for some things and interrogating him about others. Since he wished neither to change these nor to be hated by his presence, he made a trip abroad to Egypt for purposes of trade and at the same time for sightseeing, and said that he would not return for ten years. For he did not think that it was just to remain present and explain the laws, but rather that each person do what was written. |11.2| At the same time it so happened that many disputes with him arose from the notables due to the cancellations of debts, and also that both factions had changed their views because the settlement was unacceptable to them. For the people thought that he would make a redistribution of everything, while the notables thought that he would restore everything to the same order [as before] or change things only a little bit. But Solon was opposed to both, and while it was possible for him to stand with whichever side he wished and be tyrant, he chose to be hated by both sides, saving his fatherland and legislating what was best.

12.1 All the others agree that this is the way he was, and he himself in his poetry made mention of these matters in the following words:

> To the people I gave as much privilege as is sufficient,
> Neither taking away their honor nor reaching out for it;
> But as for those who had power and were admired for their wealth,
> I also declared that they should have no unseemly share.
> I stood, putting a stout shield around both,
> And did not allow either an unjust victory.[26]

|12.2| Again, revealing how the multitude should be treated:

> This is how the people would best follow their leaders
> Neither let loose too much nor forced,
> For excess breeds wanton aggression, when great prosperity attends
> Such people as have no sound mind.[27]

|12.3| And again somewhere else he says about those who wished the land to be distributed:

> They came for plunder with abundant hope,
> And each thought to find great prosperity,
> And that I, though smoothly cajoling, would show a harsh mind.

26. Fr. 5 West.
27. Fr. 6 West.

Empty things they thought then, but now in anger
They all look askance at me as if I were their enemy.
It should not be so; for what I said, with the gods' aid I accomplished.
I did nothing else pointlessly, nor does it please me
To do anything with the violence of a tyrant, or for the base
To have an equal share of the rich earth of our fatherland with the noble.[28]

|12.4| And again, both about the cancellation of debts and those previously enslaved but freed through the shaking-off of burdens, he says:

Which of the things I drew together
The people for, did I stop before I achieved?
Best witness to this in the justice of time will be
The mother, greatest of the Olympian daimons,
Black Earth, from which I once
Took up the boundary stones fixed in many places,
Who was previously enslaved, but now is free.
Many men to Athens, to their god-founded fatherland
I brought back, who had been sold, some unjustly,
Some justly, some having fled from compelling
Debt, no longer speaking the Attic
Tongue, but wandering in many places.
And those right here, suffering shameful
Slavery, trembling at their masters' ways,
I made free. These things I did by might,
Fitting together force and justice,
And I accomplished what I promised.
Statutes equally for base and noble,
Fitting straight justice to each man,
I wrote down. Another man who took up the goad as I did,
A man of evil counsel and love of possessions,
Would not have restrained the people. For had I been willing
To do what pleased their opponents at that point,
Or again to do what the other side planned against them,
The city would have been widowed of many men.
On account of this, making a defense on all sides,
I turned like a wolf among many bitches.[29]

|12.5| And again reproaching the subsequent faultfinding of both sides:

As for the people, if I am to chide them openly,
What they have now their eyes would never

28. Fr. 34 West.
29. Fr. 36 West.

Have seen even in their dreams.
And those who are greater and in force superior
Should praise me and make me their friend.

"For if some other man," he says, "had obtained this honor,"

He would not have held the people back, nor ceased
Until he stirred up the milk and taken off the fat.
But as in a no-man's-land between these men
Like a boundary stone I stood.[30]

(E) Between Solon and Pisistratus (13)

13.1 Solon went abroad due to these causes. While he was abroad, and the city was still disturbed, for four years they remained at peace. But in the fifth year after Solon's archonship,[31] because of the faction, they did not appoint an archon; and again in the fifth year,[32] due to the same cause, they had an archon-less year. |13.2| After that, with the same lapse of time, Damasias, when elected archon,[33] held office for two years and two months, until he was expelled from office by force. Then, because of the faction, they decided to choose ten archons, five from the aristocrats, three from the rustics, and two from the craftsmen, and these men held office for the year after Damasias. From this too it is clear that the archon had the greatest power. For it is evident that it is about this office they were always engaged in faction. |13.3| In general, they continued in a diseased state in matters relating to each other, some having the cancellation of debts as starting-point and alleged cause (for it turned out that they became poor), some being annoyed because of the constitution, because of the great change that had occurred, and some because of their rivalry with each other. |13.4| There were three factions, one of the coastal men, whose champion was Megacles the son of Alcmeon, who seemed especially to be pursuing a middle constitution; another of the men of the plain, who sought oligarchy, and Lycurgus led them; the third was that of the men beyond the hills, over whom Pisistratus was appointed, seeming to be the most democratic. |13.5| Added as a further adornment to these men were those who had been deprived of the debts owed to them, because of their loss, and those who were not pure in ancestry, because of their fear. A sign of this is that after the overthrow of the tyrants[34] they held a review of citizenship vote, since many shared in the constitution without being fitted to do so. [The three factions] each got their name from the places where they farmed.

34. 510 BC.

(F) The Tyranny (14–19)

14.1 Pisistratus seemed to be the most democratic, and acquired a very good reputation during the war against the Megarians.[35] He wounded himself and, as if he had suffered this at the hands of the rivaling factions, persuaded the people to give him a bodyguard; it was Aristion who wrote the proposal. He took these who were called "club-bearers," rose up against the people with these men, and—in the thirty-second year after the enactment of [Solon's] laws, in the archonship of Comeas[36]—seized the Acropolis. |14.2| It is said that when Pisistratus asked for a bodyguard, Solon spoke against it. He said that he was wiser than some people and more courageous than others; for he was wiser than those who did not know that Pisistratus was aiming at tyranny and more courageous than those who knew but remained silent. When he had spoken but had not persuaded, he set up his weapons in front of his door, and said that he had aided his fatherland as far as he was able (for he was already very old), and thought it fitting that others too should do this same thing. |14.3| Solon accomplished nothing when he made these appeals. But Pisistratus, after he seized the ruling office, managed public affairs like a true politician rather than tyrannically.[37] Yet, when his rule had not yet taken root, those with Megacles and those with Lycurgus reached a settlement and—in the sixth year after the start of his tyranny, in the archonship of Hegesias[38]—drove him out. |14.4| In the fifth year after that, Megacles, who was harassed by factional strife, again made overtures to Pisistratus, on condition that he marry his daughter, and brought him back in an archaic and overly simple way. For having spread in advance the story that Athena was bringing back Pisistratus, he found a tall and beautiful woman—from the deme of Paeania, as Herodotus says,[39] or, as some say, a Thracian garland seller from Collytus—whose name was "Phye," and adorning her in imitation of the goddess brought her in with Pisistratus; and Pisistratus drove in a chariot with the woman standing beside him. And those in the city proper, wonderstruck, received him with adoration.

15.1 His first return, then, happened like that. After that, he was driven out for the second time, around the seventh year after his return; for he did not hold his position for a long time, but because he did not wish to have intercourse with Megacles' daughter, he became afraid of both [the other] factions and withdrew. |15.2| First, he joined in settling a place around the Thermaic gulf called "Rhaicelus"; from there he went to the areas around Mt. Pangaeus, where he procured money and hired soldiers; and in the eleventh year he went to Eretria again. This was when he first tried to recover his rule by force, with many others eagerly supporting him, especially the Thebans, Lygdamis of Naxos, and the cavalry that controlled the constitution in Eretria. |15.3| He won

39. 1.60.4.

the battle at Pallene, captured the city,[40] and deprived the people of their weapons, and then held the tyranny securely. He also captured Naxos and established Lygdamis as its ruler. |15.4| He deprived the people of their weapons in the following way. Holding an armed parade in the Theseum, he attempted to address the assembly, and continued to speak to them for a short period of time. When they claimed they could not hear him, he told them to go up to the entrance gate of the Acropolis, in order for him to make himself heard better. And while he spent time speaking to them, those who had been appointed for this task took up the weapons and locked them in the nearby buildings of the Theseum, and then went to Pisistratus and gave him a sign. |15.5| When he had completed the rest of his speech, he told them what had happened to their weapons, and that they must not wonder or be despondent, but go away and look to their private affairs, while he himself would take care of all public ones.

16.1 The tyranny of Pisistratus was initially established in this way and involved this many changes. |16.2| Pisistratus, as was said,[41] managed matters concerning the city moderately and more like a true politician than tyrannically. For among other things he was humane to others, gentle and forgiving to those who made errors, and in particular lent money in advance to those without means for their occupations to support them in their farming. |16.3| He did this for the sake of two things, so that they would spend their time not in the city proper but dispersed across the countryside, and that by doing well with moderate means and being involved with their own affairs, they would neither have an appetite nor leisure for public ones. |16.4| At the same time, this resulted in his income also becoming greater, since the land was well worked; for he exacted one-tenth of the produce in tax. |16.5| That is also why he established the deme judges, and why he himself went out often into the countryside, overseeing and reconciling those who had disputes, so that they would not go down to the city proper and neglect their work. |16.6| When Pisistratus was making one such excursion, they say that the incident occurred of the man farming what was later called the "tax-free farm" on Mount Hymettus. For he saw someone digging and working what were altogether stones, and because of his surprise, he told his slave to ask what was produced from the plot. The man said, "Just evils and pains, and of these evils and pains Pisistratus should take a tenth in tax." The man answered without recognizing him. But Pisistratus was pleased by his freedom of speech and love of working, and freed him of all taxes. |16.7| He did nothing to trouble the multitude in other respects during his rule either, but always worked for peace and protected calm. That is also why many good reports were spread that the tyranny of Pisistratus was life under Cronos;[42] for it so happened that later on, when his sons succeeded him, the rule became much harsher. |16.8| The greatest of all the things mentioned was that he was democratic in character and humane. And in

40. Athens.
41. 14.3.
42. I.e., a golden age.

other respects, in fact, he wished to manage everything in accord with the laws, giving no greater share to himself; and once when he had been summoned to the Areopagus to stand trial for homicide, he appeared in court to defend himself, but the one who summoned him took fright and abandoned it. |16.9| That is also why he continued to rule for a long time, and when he was expelled,[43] he easily regained it. For the majority of both the notables and of the democrats wished him to, and he brought over to his side the first due to his friendly dealings with them, and the second due to his aid in their private affairs; and to both he was good-natured. |16.10| Also, the laws of the Athenians about tyrants were mild in these times, both the others and in particular the law about the establishment of a tyranny was especially so. This was their law: "These are the ancestral statutes of the Athenians: if any men aim at tyranny or a man aids in establishing a tyranny, he shall be deprived of citizen status, both himself and his family."

17.1 Pisistratus, then, grew old in his rule and, after becoming ill, died in the archonship of Philoneus,[44] having lived thirty-three years from when he was first established as tyrant. But he had remained in power for [only] nineteen years; for he was in exile the rest of the time. |17.2| That is also why it is evident that those people who claim that Pisistratus was the beloved of Solon and a commander in the war against the Megarians over Salamis are speaking foolishly. For that is not possible given their ages, if one calculates the lifespan of each man and the archon when he died. |17.3| When Pisistratus died, his sons held the rule, conducting affairs in the same manner. He had two sons from his lawfully wedded wife, Hippias and Hipparchus, and two from the Argive woman, Iophon and Hegesistratus (whose other name was "Thessalus"). |17.4| For Pisistratus married Timonassa, the daughter of an Argive man named "Gorgilus," who had previously been the wife of Archinus of Ambracia, of the Cypselids. From this, in fact, came his friendship toward the Argives, and a thousand of them, brought by Hegesistratus, fought together with him at the battle at Pallene.[45] Some say he married the Argive woman when he was expelled the first time, others when he [first] gained possession of his rule.

18.1 Because of their good reputations and their youth, Hipparchus and Hippias were in control of affairs, while Hippias, who was older and by nature a [true] politician and sensible, was in charge of the rule. Hipparchus was childish, amorous, and a lover of music and the arts (he was the one who summoned such men as Anacreon, Simonides, and the other poets). |18.2| Thessalus was much younger, and in his mode of life rash and prone to wanton aggression. From him too it turned out that all their troubles arose. For he was in love with Harmodius, and when he failed to win his affection, he did not

43. 17.1
44. 528/7 BC.
45. 15.3.

retrain his anger, but in other respects gave many bitter signs of it; finally, he prevented Harmodius' sister from carrying baskets in the Panathenaic festival[46] after somewhat insulting Harmodius as effeminate. This was the origin of the fact that Harmodius and Aristogeiton were provoked to take action, with many sharing in it. |18.3| When they were already on the Acropolis observing Hippias at the Panathenaic festival (for he happened to be receiving the procession, and Hipparchus to be sending it off), they saw one of those taking part in their action greeting Hippias cordially. They thought that he was betraying them and, wishing to do something before their arrest, they went down and, starting before the others, killed Hipparchus who was arranging the procession in front of the Leocoreum. This ruined the whole action. |18.4| Of these men, Harmodius was immediately killed by the spear-bearers, while Aristogeiton was arrested later and tortured for a long time. In his agony he accused many men who were both by birth among the distinguished and friends of the tyrants. For they could not immediately get hold of any trace of [the originators of] the action. But the story that was told, that Hippias had removed the weapons from those in the procession when he discovered the ones with daggers, is not true. For men did not at that time take part in the procession armed with weapons, but the democracy did later institute this. |18.5| He accused the friends of the tyrant deceitfully, as the democrats say, so that the tyrants might at the same time act impiously and become weak, by having killed those who were not responsible and their friends; but as some people say, he did not fabricate this, but instead betrayed those who were informed about the plan. |18.6| In the end, when he was unable, though doing everything, to bring about his death, he promised to disclose many others, and persuaded Hippias to give him his right hand as a pledge. When Hippias took it, he insulted him for having given his right hand to his brother's killer. This so provoked Hippias that, because of his anger, he could not restrain himself, but drew out his dagger and killed him.

19.1 What happened after that is that the tyranny became much harsher. For because of the avenging of his brother and the killing and driving out of many, Hippias was untrusting and bitter toward everyone. |19.2| In the fourth year, especially, after the death of Hipparchus,[47] when things in the city proper were in a bad way, he tried to fortify Munichia in order to be relocated there. While he was engaged in this, he was driven out by Cleomenes, the king of the Spartans, since the Spartans were constantly receiving oracles to dissolve the tyranny, due to the following cause. |19.3| The exiles, of whom the Alcmaeonids were the leaders, were unable to achieve their own return by themselves, but always stumbled. For in the other things they did, they failed, and, when they walled up Lipsydrium, in the countryside beyond Parnes, which some of those from the city proper had entered, they were besieged by the tyrants, as a result of which, after this disaster, they later on used to sing in the drinking songs:

46. Implying that she was not a virgin.
47. 510 BC.

Alas, Lipsydrium, betrayer of comrades,
What men you lost,
Good at fighting and aristocratic,
Who then showed what fathers they had.

|19.4| After failing at everything else, they contracted to build the temple at Delphi, thereby becoming well supplied with money for gaining the Spartans' aid. When the Spartans consulted the oracle, the Pythia always added that they should free Athens, persisting until the moment she urged the Spartiates into doing this, even though the Pisistratids were guest-friends of theirs. But no less a contribution was made to the Spartans' impulse by the Pisistratids' already-existing friendship toward the Argives. |19.5| First, then, they sent Anchimolus with an expedition by sea. When he was defeated and died, because Cineas the Thessalian came to their aid with one thousand cavalry, they became angrier at what had occurred and sent out Cleomenes the king with a greater army by land. When he defeated the cavalry of the Thessalians, which tried to prevent him from entering Attica, he shut up Hippias in the so-called Pelargic fort, and together with the Athenians besieged him. |19.6| While he was being besieged, it so happened that Cleomenes captured the sons of the Pisistratids slipping out. When these had been captured, the Pisistratids made an agreement for the safety of the children, carried out their own property within five days, and handed over the Acropolis to the Athenians. This was in the archonship of Harpactides,[48] when they had held the tyranny for around seventeen years after their father's death. The total together with the years their father ruled was thirty-six.

(G) From Cleisthenes' Reforms to Xerxes' Invasion (20–22)

20.1 After the tyranny had been dissolved, Isagoras the son of Tisander, a friend of the tyrants, and Cleisthenes, a member of the Alcmaeonid family, engaged in faction with each other. When he was defeated [by him] in the political clubs,[49] Cleisthenes tried to win the people over to his side by offering the constitution to the multitude. |20.2| Isagoras, failing in power, again summoned back Cleomenes, who was his guest-friend, and persuaded him to drive out the curse,[50] because the Alcmaeonids were thought to be among those accursed. |20.3| Cleisthenes withdrew and Cleomenes arrived with a few men and expelled as accursed seven hundred Athenian households. After he had accomplished this, he tried to dissolve the council [of five hundred], and to establish Isagoras and three hundred of his friends along with him in control over the city. But when the council resisted and the multitude came together, those together with Cleomenes and Isagoras fled to the Acropolis, and the people blockaded and besieged

48. 511/10 BC.
49. 34.3.
50. f6.

them for two days. On the third day, they allowed Cleomenes and all those with him to leave under treaty, and recalled Cleisthenes and the other exiles. |20.4| When the people got control of affairs, Cleisthenes was the leader and the champion of the people. For the Alcmaeonids were mostly responsible for the expulsion of the tyrants, and for most of the time continued to engage in faction [with them]. |20.5| Even earlier, Cedon of the Alcmaeonids had attacked the tyrants, which is why they sang to him too,[51] also in their drinking songs:

> Pour to Cedon too, steward, and do not forget,
> If it is to good men that we are to pour wine.

21.1 Due to these causes the people trusted Cleisthenes. Then, as champion of the multitude, in the fourth year after the overthrow of the tyranny, in the archonship of Isagoras,[52] |21.2| first, he divided everyone into ten tribes instead of four, wishing to mix them up, so that more would share in the constitution. From this it was said "no judging by tribes," to those who wished to investigate people's ancestry. |21.3| Then he established a council of five hundred instead of four hundred, fifty from each tribe (at that time they were one hundred from each). He did not arrange them in twelve tribes for the following reason: so that the division does not take place on the basis of the preexisting thirds. For from the 4 tribes there were twelve thirds, in which case the result would be that the multitude not get mixed together. |21.4| He also distributed the territory to thirty parts by demes, ten of those in the city proper, ten of the coast, and ten of the interior, and calling these "thirds," he assigned by lot three to each tribe, so that each tribe would have a share in all the regions. And he made those who lived in each of the demes fellow-demesmen of each other, so that they would not put to shame the new citizens by addressing each other by patronymics, but address them by demes; which is why the Athenians too call each other by demes. |21.5| He also established demarchs, having the same supervision as the earlier naucrari. For he also made the demes in place of the naucraries.[53] He named some of the demes from their places, some from their founders; for not all still corresponded to the particular places. |21.6| He allowed each person to belong to families, phratries, and priesthoods, in accord with ancestral customs. For the tribes he produced eponymous heroes; it was Pythia who chose ten from a hundred pre-selected ones.

22.1 When this took place, the constitution became much more democratic than Solon's. For what happened, in fact, is that the tyranny had made the laws of Solon disappear by not using them, while Cleisthenes, aiming at the multitude, put in place other new ones, among which the law about ostracism was also set up. |22.2| First,

51. 19.3.
52. 508/7 BC.
53. 8.3.

then, in the eighth year after this settlement, in the archonship of Hermocreon,[54] they produced the oath for the council of Five Hundred, which they still swear today. Next, they elected the generals by tribes, one from each tribe, and the polemarch was the leader of the whole army. |22.3| In the twelfth year after that, in the archonship of Phaenippus,[55] they won the battle at Marathon. Two years after this victory, when the people were by now feeling confident, they then first used the law about ostracism, which was set up due to suspicion about those in power, because Pisistratus from being a popular leader and general was established as tyrant. |22.4| The first to be ostracized was one of his kinsmen, Hipparchus of Collytos, the son of Charmus; and it was especially because of him that Cleisthenes had set up this law, since he wished to drive him out. For the Athenians, in accord with the people's customary mild-manneredness, allowed all the friends of the tyrants who had not joined in committing offenses during the disturbances to live in the city. Of these men Hipparchus was the leader and champion. |22.5| Immediately afterward, in the next year, in Telesinus' archonship,[56] for the first time since the tyranny, they chose by lot the nine archons, according to tribe, from the five hundred men pre-selected by the demesmen. By contrast, all previous archons had been elected [by vote]. And Megacles from Alopece, the son of Hippocrates, was ostracized. |22.6| For 3 years, then, they ostracized the friends of the tyrants, on account of whom this law was set up, but after that, in the fourth year,[57] they also removed any of the others who seemed to be too powerful. And the first of those ostracized who was distant from the tyranny was Xanthippus the son of Ariphron. |22.7| In the third year after that, in the archonship of Nicodemus, when the mines at Maroneia were discovered and the city gained a hundred talents from their works, some men advised distributing the silver to the people, but Themistocles prevented this. He did not say how he would use the money, but told them to lend one talent to each of the hundred richest Athenians; then, if they were satisfied with the outlay, the expense would be the city's; if not, the city should get back the money from those who had borrowed it. Taking the money on these terms, he had one hundred triremes built, with each of the hundred men building one; and with these they fought at Salamis against the barbarians.[58] It was in these times that Aristides the son of Lysimachus was ostracized. |22.8| In the fourth year, in the archonship of Hypsichides,[59] because of Xerxes' expedition, they took back all those who had been ostracized. And for the future they determined that those ostracized should live within Geraestus and Scyllaeum, or else be permanently deprived of their citizen status.

59. 481/0 BC.

(H) The Mid-Fifth Century (23–28)

23.1 At that time, then, the city went forward up to this point, increasing little by little together with the democracy. After the Persian Wars the council of the Areopagus grew strong again and managed the city, taking the leadership not by any formal decision but because it was responsible for [winning] the sea battle at Salamis. For when the generals were at a loss because of events and had made a proclamation that everyone should save himself, it provided and distributed eight drachmas to each man and got them to embark on the ships. |23.2| Due to this cause, then, the Athenians yielded to the council's reputation and were well governed also in these times. For it so happened that at this time they were practiced in warfare, were well thought of by the Greeks, and also—against the wishes of the Spartans—acquired supremacy at sea. |23.3| The champions of the people in these times were Aristides the son of Lysimachus and Themistocles the son of Neocles, the one being thought to [be practiced in] warfare, the other to be clever as a politician and to surpass his contemporaries in justice. That is why they made use of the one as a general, and of the other as an advisor. |23.4| The rebuilding of the walls, then, they managed together, although differing with each other; but in the case of the defection of the Ionians from the Spartans' alliance, it was Aristides who urged that forward, having observed that the Spartans were brought into discredit because of Pausanias.[60] |23.5| That is also why it was he who—in the third year after the sea battle at Salamis, in the archonship of Timosthenes[61]—fixed the first tribute payments for the cities; and he swore the oaths with the Ionians to have the same friends and enemies, for which they also sank the molten irons in the sea.[62]

24.1 After that, when the city was by now feeling confident and much money had been accumulated, Aristides advised [the people] to take the leadership, and to come down from the fields to live in the city proper; for there would be food for all, for those in the military, for those keeping guard, and for those active in public affairs, so that in this way they would get hold of the leadership. |24.2| Persuaded about this, and taking the rule, they exploited the allies in a more tyrannical way, except for the Chians, Lesbians, and Samians. These they kept as guardians of their rule, allowing them to keep their own constitutions and to rule those they happened to be ruling. |24.3| They established a good food supply for the many, as Aristides had proposed. For from the combined proceeds of the tributes, taxes, and allies, more than twenty thousand men were maintained. For there were six thousand judges, one thousand six hundred archers, and in addition to these, one thousand two hundred cavalry, five hundred men in the council, around five hundred guards of the docks; in addition to these, fifty guards on the Acropolis, around seven hundred local officials, and seven hundred abroad. In

60. He offended the allies and was recalled to Sparta.
61. 478/7 BC.
62. Signifying that the oaths were to endure until these irons arose from the sea.

addition to these, when later they braced themselves for war, two thousand five hundred hoplites, twenty guard ships, {other ships bringing the tribute [with crews amounting to] two thousand men chosen by lot};[63] then the Prytaneum, orphans, and guards of prisoners. For all these the financial management came from the common funds.

25.1 Food for the people, then, was provided through these means. For around seventeen years after the Persian Wars[64] the constitution remained governed by the council of the Areopagus, although it was declining [in power] little by little. As the multitude were increasing [in power], Ephialtes the son of Sophonides, a man who seemed to be unbribable and just toward the constitution, became champion of the people and attacked that council. |25.2| First, he did away with many of the Areopagites, bringing them to trial for their management of things. Then, in the archonship of Conon,[65] he took away from the council all the additional powers through which it had acquired the guardianship of the constitution, and gave some to the five hundred councilors, some to the people, and some to the courts. |25.3| He did this with Themistocles (one of the Areopagites[66] but also about to be tried for pro-Persian treason) being jointly responsible. Wishing the council to be dissolved, Themistocles told Ephialtes that it was about to arrest him, and told the Areopagites that he would show them some men conspiring to dissolve the constitution. In order to show them the men, who were gathering there, he took men chosen from the council to the place where Ephialtes was spending time, and was speaking in haste with them. When Ephialtes saw this, he was dumbstruck and took his seat at the altar with only his undergarment on. |25.4| Everyone was amazed at what had occurred, and after that, when the council of Five Hundred met, Ephialtes and Themistocles accused the Areopagites, and again in the assembly in the same way, until they stripped them of their power. And {. . .}[67] Ephialtes was also killed, treacherously murdered not much later by Aristodicus of Tanagra.

26.1 In this way the council of the Areopagus was deprived of its supervision.[68] What happened after that is that the constitution was loosened, because of those striving zealously for popular leadership. For in these times it so happened that the more respectable citizens had no leader, but acting as their champion was Cimon the son of Miltiades, who was fairly young and had only recently come forward in city affairs, and that, in addition, many of them had died in war. For military service at that time was based on the register [of troops] and, since the generals in charge were inexperienced in warfare but were honored because of their ancestors' reputations, it repeatedly happened that of those going out [to war], up to two or three thousand died, with the result that

68. 3.6, 4.4, 8.2.

the most decent men, both among the people and among the wealthy, were killed. |26.2| They managed all other things not in the same way as before with respect to abiding by the laws,[69] though they did not change the election of the nine archons. But in the sixth year after the death of Ephialtes[70] they resolved that the men from whom the allotment for the nine archons was to be made should also be pre-selected from the yoke-men;[71] and the first of these to hold office was Mnesithides. Before that all of them were from the cavalrymen and the five-hundred-bushel-men, while the yoke-men held the routine offices, unless something in the laws had been overlooked. |26.3| In the fifth year after that, in the archonship of Lysicrates,[72] the thirty judges who were called "judges by demes"[73] were re-established; |26.4| and in the third year after that, in the archonship of Antidotus,[74] because of the number of citizens, they determined on the proposal of Pericles that a man who was not born from two citizens from the city proper should not participate in the city.

27.1 What happened after that, when Pericles came forward as popular leader, after having first gained a good reputation while still a young man when he brought a charge against the general Cimon at his inspection, is that the constitution became still more democratic. For he took away some powers of the Areopagus, and, above all, urged the city toward naval power, as a result of which the many, becoming confident, increasingly led the whole constitution toward themselves. |27.2| In the forty-ninth year after the sea battle at Salamis, in the archonship of Pythodorus,[75] the war against the Peloponnesians broke out, in which the people were closed up in the city proper and grew accustomed to being paid while on campaigns, and voluntarily in some matters and involuntarily in others, deliberately chose to manage the constitution themselves. |27.3| Pericles was first to introduce payment for judges,[76] counteracting as popular leader Cimon's abundance of resources. For Cimon, because he had a tyrant's wealth,[77] first performed Athens' public services brilliantly; then he maintained many of his fellow-demesmen, for anyone of the deme of Lacidiadae who wished could go each day and receive moderate means of subsistence from him; further, all his lands were unfenced, so that it was possible for anyone who wished to enjoy its fruits. |27.4| Pericles' property was insufficient to provide this service. So, on the advice of Damonides of Oea[78] (who was thought to have been the proposer of many things to Pericles, for which they ostracized

him later[79]) that since he was being defeated through private resources, he should give the many their own, he constructed a system of public payments for judges. Some charged that as a result the judges became worse, since it was always random men rather than decent ones who were anxious to take part in the lottery.[80] |27.5| After that, the practice of judicial bribery began, with Anytus first introducing it after his generalship at Pylos. For he was brought to trial by some men for losing Pylos,[81] but he bribed the public court and got off.

28.1 As long as Pericles was champion of the people, things regarding the constitution were better, but after Pericles died[82] they were much worse. For at that time the people first took as its champion someone who was not well reputed among the decent men; but in earlier times the decent men continued to serve as popular leaders. |28.2| For, at the outset, the first champion of the people was Solon; the second was Pisistratus; and of the wellborn and notable, Lycurgus. After the tyranny was overthrown, it was Cleisthenes, of the Alcmaeonid family, and there was no factional leader opposed to him, since those around Isagoras had departed into exile. After that, Xanthippus was champion of the people, and Miltiades of the notables; then Themistocles and Aristides, respectively; after these men, Ephialtes was champion of the people, Cimon the son of Miltiades of the notables; then Pericles of the people, and Thucydides, who was a relative of Cimon, of the others. |28.3| After Pericles' death, Nicias, who died in Sicily, championed the distinguished men, and Cleon the son of Cleaenetus the people: Cleon seems especially to have corrupted the people by his [wild] impulses, and was the first to shout and utter insults from the speaker's platform and address the people with his undergarment hitched up, when the others spoke in an orderly way. Then, after these, Theramenes the son of Hagnon was champion of the others, and of the people, Cleophon the lyre-maker, who also first provided the two-obol grant.[83] (That continued for some time, but after that Callicrates of Paeania abolished it, having first promised to add another obol to the two obols.) Later they condemned both these men to death; for the multitude were accustomed, if they were deceived, later to hate those who in any way led them to do what was not proper. |28.4| From Cleophon on there was already a continuous succession in popular leadership of those who especially wished to be daring and to gratify the many, looking only to immediate concerns. |28.5| The best of the Athenian politicians after the ancients seem to have been Nicias, Thucydides, and Theramenes. About Nicias and Thucydides pretty much everyone agrees that they were not only noble and good men but also true politicians and treated the whole city in a fatherly way. But about Theramenes, because in his time there happened to be constitutional troubles, judgment is disputed. However, it seems to those who do not

declare their views cursorily that he did not dissolve all the constitutions, as people slander him by alleging, but supported them all as long as they did not transgress the laws, since he was able to take part in political life in all of them (which is precisely the work of a good citizen), but when they broke the laws he did not go along with them, but incurred their hatred.

(I) The Four Hundred and the Five Thousand (29–34)

29.1 While things were evenly balanced in the war, [the Athenians] guarded the democracy. But when, after the disaster that occurred in Sicily,[84] the Spartans' position became stronger because of their alliance with the king,[85] they were forced to remove the democracy and establish the constitution of the Four Hundred,[86] with Melobius making the speech on behalf of the decree and Pythodorus the Anaphlystian writing the formal proposal. The many were persuaded because they thought that the king would more likely fight on their side if they made the constitution oligarchic. |29.2| Pythodorus' decree was of the following nature: the people should elect along with the existing ten *probouloi*[87] twenty others from those over the age of forty who, having sworn to draft what they thought best for the city, are to draft a text concerning the public safety. Any of the others who wish is permitted to draft proposals, so that they might choose the best from all of them. |29.3| Cleitophon said in other respects what Pythodorus had said, but proposed in addition that those who were elected should also seek out the ancestral laws that Cleisthenes set up when he established the democracy,[88] so that by hearing these too they would deliberate for the best (on the supposition that the constitution of Cleisthenes was not democratic but much the same as that of Solon). |29.4| Those who were elected proposed, first, that the prytanes must put to a vote all proposals concerning public safety. Then they abolished writs for illegality (*graphai paranomôn*), indictments (*eisaggeliai*), and challenges (*prosklêseis*), so that those of the Athenians who wished might offer advice on what had been laid before them; and if anyone on account of this either proposed a penalty, made a challenge, or brought someone before a court, he should be liable to a denunciation to a public official (*endeixis*) and summary arrest (*apagôgê*) before the generals, and the generals should hand him over to the Eleven to be punished by death. |29.5| After that, they arranged the constitution in the following way. It is not permitted to spend the money that comes in elsewhere than on the war; all the officials are to hold office without pay as long as the war continues, except for the nine archons and whatever prytanes there

88. 22.1.

might be; these are to get three obols each per day. All the rest of the constitution is to be turned over to those Athenians who are most able to provide public service both with their bodies and with their money, not fewer than five thousand, as long as the war continues. These men are also to have the authority to make treaties with whomever they wish. And ten men over the age of forty are to be elected from each tribe to register the five thousand, swearing an oath over full-grown sacrificial animals.

30.1 The committee elected, then, drafted these things. When they had been ratified, the Five Thousand elected a hundred men from their own number to write up the constitution. Those who were elected wrote up and presented the following. |30.2| Every year those over thirty years of age should be councilors, without pay. From these should come the generals, the nine archons, the sacred recorder (*hieromnêmôn*), the regimental commanders (*taxiarchoi*), the cavalry commanders in chief (*hipparchoi*), the commanders of the tribal regiments of cavalry (*phularchoi*) and garrison commanders, the ten treasurers of the sacred funds of the goddess Athena and the other gods, and twenty Hellenic treasurers (*hellênotamiai*) to handle all the other sacred monies, and overseers of temples and sacred rites (*hieropoioi*) and supervisors (*epimelêtai*), ten each. All of these are to be elected from pre-selected candidates, pre-selecting more from those currently in the council. All the other officials are to be chosen by lot and not from the council. The Hellenic treasurers, who handle the money, should not join in sessions of the council. |30.3| For the future, four councils should be produced from the stated age group, and of these a part appointed by lot should serve as council;[89] the other men too should be distributed to each section. The hundred men should distribute themselves and the others into four parts as equally as possible and make a selection by lot, and the council should serve for a year. |30.4| They should deliberate as seems best to them about the money, so that it would be safe and spent on what was necessary, and about other matters as best they could. And if they wished to deliberate about something with more people, each man should co-opt a co-opted man, whomever he wished, of those from the same age group. They should hold the sessions of the council every five days, unless they needed more. |30.5| The nine archons should convene the council; five men appointed by lot from the council should count the votes, and of these one should be appointed by lot each day to put proposals to a vote. The five men appointed by lot should choose by lot those who wish to come before the council, first, on sacred matters, second, for heralds, third, for embassies, and fourth, for other things. War matters, whenever necessary, the generals coming forward may discuss without being chosen by lot. |30.6| A councilor who does not enter the council house at the time announced in advance owes a drachma for each day unless he gets a leave of absence from the council and is away.

89. I.e., those members of the Five Thousand, qualified by age to be in the council, should be divided into four (quarter) councils, to serve in turn.

31.1 This, then, is the constitution they wrote up for the future, but for the present, they wrote up the following one. There should be a council of four hundred in accord with the ancestral ways, forty from each tribe, from pre-selected men elected by the tribesmen from those over thirty. These men are to appoint the officials and {write something about the oath that was to be sworn},[90] and about the laws, the inspections, and the other things, do as they think to be advantageous. |31.2| It is the laws they set up about political matters that they are to use, and it should not be permitted to change them or set up others. For now the election of the generals is to be made from all the Five Thousand; but when the council is established, it should make an inspection into weapons and elect ten men [as generals] and a secretary for them, and the men elected are to exercise their offices with autocratic authority for the coming year, and if they need anything, to deliberate with the council. |31.3| They are to elect one cavalry commander in chief and ten commanders of the tribal regiments of cavalry; and for the future the council is to make the election of these in accord with what was written. For the other offices, except for the council and the generals, it is not permitted either to these or to anyone else to exercise the same office more than once. For the rest of the time, in order that the Four Hundred be distributed into the four sections, when it is possible for them to deliberate with the others,[91] the hundred men are to distribute them.

32.1 The hundred men, then, elected by the Five Thousand wrote up this constitution. When it had been ratified by the multitude, with Aristomachus putting it to a vote, the council in [the archonship] of Callias,[92] before completing its term, was dissolved on the fourteenth day of the month Thargelion,[93] and the Four Hundred entered office on the twenty-second day of Thargelion.[94] The council chosen by lot was due to enter office on the fourteenth of Scirophorion.[95] |32.2| The oligarchy was established in this way, then, in the archonship of Callias, around a hundred years after the expulsion of the tyrants.[96] The men especially responsible were Pisander, Antiphon, Phrynichus, and Theramenes—men who were both well born and seemed to be outstanding in comprehension and consideration. |32.3| When this constitution had come into being, the Five Thousand were only nominally elected, and the Four Hundred, together with the ten with autocratic authority, entered the council house and ruled the city. And they sent ambassadors to the Spartans to try to end the war on the basis of what each side possessed. But when the Spartans would not listen unless the Athenians also gave up their rule of the sea, they withdrew.

33.1 The constitution of the Four Hundred lasted, then, around four months, and of these Mnasilochus was archon for two months in the archonship of Theopompus,[97] who was archon for the remaining ten months. When the Athenians had been defeated in the sea battle near Eretria, and the whole of Euboea had revolted except for Oreus, they bore this misfortune with greater difficulty than what had gone before (for they happened to be deriving more benefit from Euboea than from Attica), and they dissolved the Four Hundred and handed over their affairs to the Five Thousand drawn from the hoplites, decreeing that no office should be a paid one. |33.2| Those most responsible for the overthrow were Aristocrates and Theramenes, who were jointly dissatisfied with what was done by the Four Hundred. For they did everything on their own, referring nothing to the Five Thousand. They seemed to have been well governed in these times, when they were in a state of war and the constitution was drawn from the hoplites.

(J) The Thirty and the Ten (34–41)

34.1 The people, then, soon deprived these men of [control over] the constitution. In the seventh year after the dissolution of the Four Hundred, in the archonship of Callias of Angele, and after the sea battle of Arginusae occurred, what happened then is, first, that the ten generals who had been victorious in the sea battle were all judged by a single vote by show of hands, although some of them had not taken part in the naval battle and others were saved on another man's ship, because the people were deceived by those who had incited their anger. Then, when the Spartans wished to withdraw from Decelea and make peace on condition that each side keep what it had, some were eager for that, but the multitude would not hear of it, because they were deceived by Cleophon, who prevented the peace from occurring by going into the assembly drunk and wearing a breastplate, claiming that he would not grant it unless the Spartans relinquished all the cities. |34.2| They did not deal with affairs well at that time, and not long afterward they recognized their mistake. For one year later, in the archonship of Alexias,[98] they had bad luck in the naval battle at Aegospotami, and as a result of that Lysander gained control of the city, and he established the Thirty in the following way. |34.3| Peace was made with them on condition that they be governed by the ancestral constitution. The democrats were trying to save the democracy, but the notables who were in the political clubs and those of the exiles who came back after the peace were eager for oligarchy, while those who took no part in any political clubs, but who otherwise seemed in no way inferior to any of the [other] citizens, were seeking the ancestral constitution. Among these were Archinus, Anytus, Cleitophon, Phormisius, and many others, and their champion was especially Theramenes. When Lysander added his support to the

97. 411/0 BC.
98. 405/4 BC.

oligarchs, the people were panic-stricken and compelled to vote by show of hands for the oligarchy. Dracontides of Aphidna wrote the decree.

35.1 That is the way, then, in which—in the archonship of Pythodoros[99]—the Thirty were installed. When they had gained control of the city, they disregarded the other things that had been decided about the constitution, but installed five hundred councilors and the other officials from a thousand pre-selected men; and, choosing as their allies ten governors of Piraeus, eleven guards of the prison, and three hundred whip-bearing attendants, they held the city by themselves. |35.2| At first, they were moderate to the citizens and pretended to aim at the ancestral constitution. They took down from the Areopagus the laws of Ephialtes and Archestratus about the Areopagites; and they dissolved those statutes of Solon that admitted grounds for dispute as well as the authority which lay with the judges, on the pretext they were "straightening" the constitution and making it free of disputes. For example, concerning bequeathing one's property to whomever one wishes, they gave men that power once and for all, taking away the attached difficulties ("unless because of madness or old age, or being persuaded by a woman"), so that there would be no opening for sycophants. They did likewise in other cases too. |35.3| Initially, then, these are the things they did, and they got rid of the sycophants and those associating with the people in order to curry favor with them contrary to what was best, and who were evildoers and wicked. And the city was pleased at these deeds, thinking that they were acting for the sake of the best. |35.4| But when they had a stronger hold on the city, they kept their hands off none of the citizens, but killed those who were distinguished by their property, family, and reputation, cunningly doing away with [the sources of] their fear and wishing to plunder their property; and after a short time had passed they had killed no fewer than one thousand five hundred.

36.1 With the city declining in this way, Theramenes, annoyed at what was occurring, urged them to cease their wanton violence and give a share in affairs to the best men. At first, they opposed this; but when word had spread to the multitude and the many were well-disposed to Theramenes, fearing that by becoming champion of the people he would dissolve their dynasty, they registered three thousand of the citizens, so as to give them a share in the constitution. |36.2| Again Theramenes also objected to this, first, because they wished to give a share in the constitution to the decent men but were giving it only to three thousand, as if virtue were limited to this number, and then because they were doing two entirely contrary things, establishing a violent rule and also making themselves weaker than those who were ruled. They paid no heed to this, but for a long time delayed the register of the Three Thousand, and kept to themselves those they had decided on. But when it seemed best to them to publish this, they erased some of those written on the list, and inserted instead some of those excluded.

99. 404/3 BC.

37.1 Once winter had set in, Thrasyboulus with the exiles seized Phyle, and things went badly for the expedition that the Thirty led out. They then decided to deprive the others[100] of their weapons, and to destroy Theramenes in the following way. They introduced two laws to the council, ordering it to vote for them by show of hands: one of these gave the Thirty autocratic authority to put to death those of the citizens not included in the register of the Three Thousand; the other prevented from participating in the present constitution those who had destroyed the walled fort at Eëtioneia or done anything against the Four Hundred who had established the previous oligarchy. It was in both of these that, as it happened, Theramenes had taken part, so that when the two laws were ratified the result was that he was outside the constitution and the Thirty had the authority to execute him. |37.2| When Theramenes was killed, they deprived all except the Three Thousand of their weapons, and in other respects advanced greatly toward savagery and wickedness. They sent ambassadors to Sparta and both spoke against Theramenes and asked the Spartans for aid. Having heard them, the Spartans sent Callibius as governor and around seven hundred soldiers, who came to the Acropolis and guarded it.

38.1 After that, the men from Phyle captured Munichia and defeated in battle those who came to aid the Thirty. The men from the city proper withdrew after the dangerous venture and the next day crowded into the marketplace, abolished the Thirty, and elected ten of the citizens with autocratic authority for ending the war. But, on taking over the rule, they did not do the things for which they had been elected, but sent envoys to Sparta to summon aid and borrow money. |38.2| Those in the constitution took this badly; but the Ten, afraid that they would be overthrown from their rule and wishing to strike terror in the others (which in fact occurred), arrested Demaretus, who was second to none of the citizens, and put him to death. And so they kept a stable hold on affairs, with Callibius and the Peloponnesians who were present fighting alongside them and, in addition to these, some of those in the cavalry; for some of these were among the citizens most eager that those from Phyle not return. |38.3| But those holding Piraeus and [the hill of] Munichia, once all the people defected to them, prevailed in the war. They then abolished the first Ten elected and elected another Ten, whom they thought to be the best men, with the result that under them settlements were reached and the people returned, with these men eagerly fighting alongside them. Their leading champions were especially Rhinon of Paeania and Phayllus of Acherdus. For before Pausanias arrived these men made overtures to those in Piraeus, and when he arrived, they sent messages to those in Piraeus and eagerly supported their return. |38.4| For Pausanias, king of the Spartans, together with the ten mediators later arriving from Sparta, whom he himself encouraged to come, brought to completion the peace and the settlements. Rhinon and his colleagues were praised because of their goodwill toward the people:

100. 37.2.

they received their commission under the oligarchy, but they submitted their inspections under the democracy, and no one—either among those who remained in the city proper or among those who had come back from Piraeus—made any complaint against them. On the contrary, Rhinon was also immediately elected general because of this.

39.1 The settlements were reached in the archonship of Eucleides,[101] in accord with the following agreements. Of the Athenians who had remained in the city proper, those wishing to emigrate are to live in Eleusis with citizen status, control and autocratic authority over their property, and receipt of their revenues. |39.2| The sanctuary is to be common to both sides, and the Ceryces and the Eumolpidae[102] are to take care of it in accord with ancestral tradition. It is not permitted for those from Eleusis to go to the city proper [of Athens] or for those from the city proper to go to Eleusis, except for the sacred Mysteries in the case of each. They are to contribute to the alliance[103] from their income just like the other Athenians. |39.3| If any of those departing take a house at Eleusis, they are to persuade the owner; if they happen not to agree with each other, each is to choose three assessors, and are to accept whatever price these men fix. Of the Eleusinians, those whom the [emigrants] wish are to share the same house with them. |39.4| There is to be a registration for those who wish to emigrate: for those at home, within ten days from when they swore the oaths and twenty days from their emigration; for those away, on these same terms, from when they arrived home. |39.5| It is not permitted for a man living in Eleusis to hold any of the offices in the city proper before he registers again in the city proper. Trials for murder, if anyone has killed or wounded someone by his own hand, are to be in accord with ancestral ways. |39.6| It is not permitted for anyone to bring up past evils, except against the Thirty, the Ten, the Eleven, and those ruling Piraeus, and not even against these if they submitted inspections. Those who ruled in Piraeus should submit inspections among those in Piraeus, and those in the city proper among those who satisfied property assessments. Those who are not willing to do so, on this basis, should emigrate. The money they borrowed for the war each side is to give back separately.

40.1 When the settlements had been reached in this way, those who had fought on the side of the Thirty were afraid, and many, though thinking of emigrating, were delaying their registration until the last days, as everyone is inclined to do. Archinus, seeing the numbers and wishing to hold them back, canceled the remaining days for registration, so that many people would be forced to remain involuntarily, until they gained in confidence. |40.2| And in this Archinus seems to have administered things well; and also after that when he brought a writ of illegality against the decree of Thrasybulus, which granted citizenship to all those who joined in the return from Piraeus, some of whom

101. 403/2 BC.
102. f2.
103. Of Athens with Sparta after 404 BC.

were manifestly slaves; and thirdly, when someone began to bring up the past evils of those who had returned, by bringing him before the council and persuading it to put him to death without a trial.[104] He said that now they could show if they wished to save the democracy and abide by their oaths; for by letting him go they would encourage the others too, but if they put him to death, they would set an example for all. And this is in fact what happened; for when he had been put to death, nobody later ever brought up past evils. |40.3| But they seem to have dealt with their past misfortunes in the best and most truly political way of all, both individually and collectively; for not only did they wipe out accusations about earlier matters, but also the money which the Thirty took for the war they collectively gave back to the Spartans, although the agreements stipulated that each side, those from the city proper and those from Piraeus, pay back separately, because they thought this must be the first starting-point of their concord. In other cities, by contrast, not only do democrats who win power not make payments from their personal property, but they also redistribute the land. |40.4| They also reached a settlement with those who had moved to Eleusis, in the third year after their emigration, in the archonship of Xenaenetus.[105]

(K) The Conclusion to the First Part

41.1 That, then, is what happened to occur in later times; but it is at this point that the people gained the control of affairs and established the current constitution, in the archonship of Pythodorus,[106] when the people seem to have justly taken hold of the constitution, because the people had brought about their return[107] on their own. |41.2| Of the changes, this was the eleventh in number. For the first modification of what was there initially was that of Ion[108] and those who settled with him; for that was when they were first distributed among the four tribes and established the four tribal kings.[109] The second, and the first after that to have the order of a constitution, was that under Theseus, inclining slightly away from the kingly. After that, was the one under Draco, in which they also first wrote up laws. The third was the one after the faction, the one under Solon, from which came the starting-point of democracy. Fourth was the tyranny under Pisistratus. Fifth, after the overthrow of the tyrants, was the one under Cleisthenes, more democratic than that of Solon. Sixth was the one after the Persian Wars,[110] with the council of the Areopagus in charge. Seventh, and after that, was the one that Aristides pointed to and Ephialtes completed when he overthrew the council

of the Areopagus: what happened in it was that because of the popular leaders the city made the worst mistakes because of its rule of the sea. Eighth was the establishment of the Four Hundred, and after that, ninth, was the democracy again. Tenth, the tyranny of the Thirty and the Ten. Eleventh, the one after the return from Phyle and out of Piraeus, from which time it has continued until the present one, always adding to the power of the multitude. For the people themselves have made themselves to control everything, and they manage everything by decrees and by the courts, in which it is the people that have the power; for even the judgments of the council have passed into the hands of the people. And this they seem to do correctly; for the few are more easily corrupted, both by profit and by favors, than the many. |41.3| At first, they refused to make the assembly a paid office; but when people were not attending the assembly, and the prytanes tried clever devices to make the multitude attend for voting to be ratified, first, Agyrrhius provided an obol, and after him Heracleides of Clazomenae, who was called "king," two obols, and Agyrrhius again, three obols.

(L) Registration and Training of Citizens (42)

42.1 The present way the constitution is established is as follows. It is those born from two citizens who participate in the constitution and are registered among their demesmen when they are eighteen years old. When they are registered, the demesmen, having sworn an oath, take a vote about them: first, as to whether they seem to have reached the age required by the law, and if they do not seem so, they go back again among the boys; second, as to whether a boy is free and has been born in accord with the laws. Then, if they vote to reject him as not being free, he appeals to the court, while the demesmen elect five men from among themselves as accusers, and if he does not seem to have been registered justly, the city sells him into slavery; but if he wins, it is obligatory for the demesmen to register him. |42.2| After that, the council examines those who have been registered, and if anyone seems to be younger than eighteen years, it punishes the demesmen who registered him. When the ephebes[111] have been examined, their fathers gather by tribes, swear an oath, and elect three of the tribesmen who are over forty years old, whom they consider to be the best and most suitable, to take care of the ephebes, and from these the people elect one man from each tribe as temperance-guardian (*sôphronistês*), and from the other Athenians an order-keeper (*kosmêtês*) over all of them. |42.3| Taking the ephebes, these men first go around to the holy places, and then proceed to Piraeus, where some guard [the hill of] Munichia, some [the peninsula of] Acte. The people also elect two coaches for them, and teachers who teach them to fight in hoplite armor, shoot arrows, throw javelins, and fire catapults. They also give the temperance-guardians one drachma each for their food, and to the ephebes four obols each. Each temperance-guardian takes the money of his tribesmen and buys the provisions for all of them in common (for

111. The young men who have passed examination.

they mess together by tribes), and takes care of all the other things. |42.4| And in this way they spend the first year. The next year an assembly is held in the theater,[112] where they demonstrate their military drills to the people. After receiving a shield and a spear from the city, they patrol the countryside and spend their time in the guardhouses. |42.5| They guard for two years, wearing short cloaks, and are exempt from everything else; and in order that there be no excuse for being away, they neither bring a lawsuit nor have one brought against them, except concerning inheritance and heiresses,[113] or if a priesthood in accord with their family came up for anyone. After the two years have passed, they at that point are with the others.

(M) Officials and the Council (43–49)

43.1 Matters concerning the registration of the citizens and the ephebes, then, are this way. All the officials for routine management they make chosen by lot, except for the treasurer of the military fund, those in charge of the festival fund, and the one in charge of the fountains: these they elect, and those elected hold office from Panathenaic festival to Panathenaic festival. They also elect all the offices for war. |43.2| The council is of 500 chosen by lot, 50 from each tribe. Each of the tribes is prytane in turn, in accord with the lot they have drawn; the first four serve for 36 days each, the later 6 for 35 days each (for they regulate the year in accord with the moon). |43.3| The prytanes first eat together in the Tholus, receiving money from the city; then they convene both the council and the people: the council every day, except if there is some day of exemption, the people four times in each prytany. And these men prescribe how many things the council must deal with, what on each day, and where to meet. |43.4| These men also prescribe the assemblies. One is the assembly with full control, in which it is necessary to vote on whether the officials appear to be conducting their offices well, and to transact business concerning wheat[114] and concerning guarding the territory, and on this day those who wish are to make indictments, and schedules of publicly confiscated property, distributions of inheritances, and heiresses are to be read out, so that none escapes notice without being claimed. |43.5| In the sixth prytany, in addition to what has been said, they also hold a vote on ostracism, as to whether it seems they should hold one or not, and on preliminary accusations (*probolai*) against sycophants, Athenians, and resident aliens, up to three of each, and whether anyone having promised something to the people has not kept his promise. |43.6| A second assembly is for supplications, in which whoever wishes makes a supplication about whatever he wishes, whether private or public, and speaks to the people. The other two assemblies are for other matters, in which the laws order that they should transact three sacred items, three for heralds and

112. Of Dionysus.
113. A woman could not represent herself in court, so a relative among the ephebes might have to represent her.
114. Athens depended on imported wheat.

embassies, and three secular. Sometimes they also transact business without a prior vote. Heralds and ambassadors approach the prytanes first, and those bringing letters give them to these men.

44.1 There is a single chairman of the prytanes appointed by lot. He is chairman for a night and day, and it is not possible either to be one for more time, or for the same man to be one twice. He watches over both the keys of the holy places where the money and documents of the city are kept and the public seal, and it is necessary for him, and for a third of the prytanes whom he orders to do so, to remain in the Tholus. |44.2| And whenever the prytanes bring together the council or the people, he chooses by lot nine presiding officials (*proedroi*), one from each tribe except for the tribe in prytany, and again from these one chairman, and he hands over the agenda to them. |44.3| Taking it over, they are in charge of good order, and put forward the things to be transacted, and they judge the votes conducted by show of hands, manage all the other things, and have the authority to dismiss the meeting. And it is not possible to be chairman more than once in the year, but it is possible to be the presiding official once in each prytany. |44.4| They also hold in the assembly elections of generals, cavalry commanders, and the other war officers, in accord with what seems best to the people. The prytanes do this after the sixth prytany in whose term there are good omens. There must be a preliminary vote about this too.[115]

45.1 The council previously had authority to punish with fines, imprison, and condemn to death. And when it was taking Lysimachus to the public executioner and he was already sitting there and about to be put to death, Eumelides of Alopece took him away saying that none of the citizens should die without the judgment of a court. And when judgment in the court took place, Lysimachus was acquitted and gained the nickname "the one who escaped the garotte." And the people took away from the council the power to execute, imprison, or punish with fines, and it set up a law that if the council condemned anyone for wrongdoing or fined him, the thesmothetae[116] are to present the condemnations and proposals for punishment to the court, and whatever the judges voted, that is what should have authority. |45.2| The council judges most of the officials, and especially those who handle money. The judgment does not have final authority, but may be referred to the court. It is also possible for private citizens to make an indictment for not following the laws against any of the officials they wish. These men may also appeal to the court if the council condemns them. |45.3| It also examines the men who will be councilors the next year and the nine archons. Previously, it had the authority to reject them, but now these men can appeal to the court. |45.4| In these matters, then, the council does not have control. It conducts a preliminary deliberation for the people, and it is not possible for the people to decree anything

115. 45.4.
116. 59, 63–65.

without it being the object of a preliminary deliberation or anything the prytanes have not prescribed. For the man who succeeded [in proposing a decree that had not been approved by the council] was liable to a writ of illegality.

46.1 The council also takes care of the triremes that have been built, and the equipment and the ship-sheds, and it builds new triremes and quadriremes, whichever the people vote, and equipment and ship-sheds for these. The people elect architects for the ships. If they do not hand over the ships fully completed to the new council, they cannot take their award;[117] for they take it under the next council. The council produces the triremes, choosing ten men from itself as trireme-makers. |46.2| It also inspects all the public buildings, and if anyone seems to have done wrong, it reports this person to the people, and once it convicts him, it hands him over to a court.

47.1 The council also co-manages most things with the other officials. First, there are the ten treasurers of Athena, one chosen by lot from each tribe, from the five-hundred-bushel-men, in accord with the law of Solon[118] (for that law is still in effect), but the one who is appointed by lot is the official even if he is very poor. They take over the statue of Athena, the Victories, the rest of the ornamentation, and the money, in the presence of the council. |47.2| Next, the commissioners for public contracts (*pôlêtai*) are 10 in number, one chosen by lot from each tribe. They, together with the treasurer of the military fund and the men elected for the festival fund, let all the leases and sell [the workings of] the mines and the [collecting of] taxes,[119] in the presence of the council. And they ratify those to whom the council voted [the workings of] the mines that are sold (the ones in working condition sold for three years, the abandoned ones sold for seven years), and they sell the properties of those exiled by the Areopagus and the others, in the presence of the council, and the 9 archons ratify them. And the ones sold for a year, after writing up on whitened boards the buyer and how much they were sold for, they hand over to the council. |47.3| They write up separately, on ten writing boards, those who must pay each prytany, and separately those who must pay three times a year, making a writing board for each payment, and separately those who must pay at the ninth prytany. They write up also the lands and the houses that have been registered and sold in the court; for they sell these things too. For houses, it is necessary to pay the price in 5 years, for the lands in 10. They pay these in the ninth prytany. |47.4| Also, the king archon[120] presents the leases of sacred lands, having written them up on whitened boards. The lease for these is also for ten years, and the payment is made in the 9th prytany. That is why indeed most of the money is collected in this prytany. |47.5| The boards written up in accord with the payments are then brought in to the council, and the public slave keeps watch over them. When there is a payment of

117. A gold crown.
118. 7.4.
119. 43.1.
120. 57.

money, he hands over these particular boards to the receivers (*apodektai*), taking down from the racks those whose money on that day must be paid and erased. The others are kept separately, in order that they are not erased before [the debt is paid].

48.1 There are ten receivers, corresponding to the tribes, chosen by lot. These take the boards and wipe off the money paid, in front of the council in the council house, and they give back the boards to the public slave. And if anyone misses a payment, he is inscribed there, and it is necessary that he pay double what is missing or be imprisoned, and the council has the authority to exact this and to imprison, in accord with the laws. |48.2| On the first day, they receive all the payments and divide them among the officials. On the next day, they introduce the division of payments, after writing it on a tablet and registering it in the council house. They call for anyone in the council who knows anyone who has been unjust as regards the division, whether an official or a private citizen, and they put motions to the vote if anyone seems to have done something unjust. |48.3| The councilors also choose by lot ten auditors (*logistai*) from among themselves to check the accounts of the officials in each prytany. |48.4| They also choose by lot inspectors (*euthunoi*), one for each tribe, and 2 assistants (*paredroi*) for each of the inspectors, who must sit by the eponymous hero[121] of each tribe in market hours. If anyone wishes to invoke a private or public inspection against any of those who have submitted inspections in the court, within 30 days, he writes on a whitened board his own name, that of the defendant, and the offense he accuses him of, adds the assessment (whatever seems correct to him), and gives it to the inspector. |48.5| The inspector takes it and reads it. If he convicts, he hands over private matters to the deme judges who are judging cases for the relevant tribe, and registers public ones with the thesmothetae. The thesmothetae, for their part, if they take it over, present the inspection in the court again, and whatever the judges decide, this is what has authority.

49.1 The council also examines the horses, and if anyone with a good horse seems to maintain it badly, it fines him the food allowance.[122] It brands a wheel on the jaw of those horses that are unable to keep up, or are unwilling to stay in position, but instead retreat, and the horse that has undergone this is not approved. It also examines the mounted skirmishers (*prodromoi*), to see which seem to it to be suitable to skirmish, and if it votes anyone out, this person is deprived of his horse. It also examines the infantry that serves with the cavalry (*hamippoi*) and if it votes anyone out, he ceases to receive his pay. |49.2| The commissioners of registration (*katalogeis*), ten men whom the people elect, register and hand over the names of those they register as cavalrymen to the cavalry commanders in chief and the commanders of the tribal regiments of cavalry, and these men take up and carry the register to the council. They open the tablet on which the names of the cavalrymen have been sealed up. They excuse those who had

121. 21.6.
122. Cavalry horses were publicly subsidized.

been previously registered who swear under oath that they are unable in body or in property to be cavalrymen; and they summon those who have been registered, and if anyone swears under oath that he is unable in body or in property to be a cavalryman, they release him; as for the one who does not swear an oath of release, the councilors vote on whether he is suitable to be a cavalryman or not. If they vote that he is, they register him on the tablet; if not, they release him too. |49.3| The council once judged the patterns and the robe (*peplos*) [for the Parthenon Athena], but now the court appointed by lot does so; for the councilors were thought to employ favoritism in their judgment. And jointly with the treasurer of the military fund it takes care of the production of the Victories and the prizes for the Panathenaic festival. |49.4| The council also examines invalids. For there is a law that orders those who possess less than three minas, and are maimed in their bodies so they can do no work, to be examined by the council and each given two obols per day for sustenance from public funds. And there is a treasurer for them assigned by lot. |49.5| And the council, jointly with the other officials, manages (one might almost say) most things.

(N) Annual Officials (50–54)

50.1 These, then, are the things managed by the council. Also chosen by lot are repairers of sacred things, ten men who take thirty minas from the receivers and repair those of the temples that especially need it. |50.2| Also ten city managers (*astunomoi*), 5 of whom hold office in Piraeus, five in the city proper. These see to it that the pipe-girls, harp-girls, and lyre-girls are not hired for more than two drachmas, and if more are eager to employ the same girl, these men hold a lottery and hire her out to the man chosen by lot. And they take care that none of the dung collectors deposit dung within 10 stades of the city wall. And they prevent building above the streets, extending balconies over the streets, making overhead drainpipes that have spouts into the street, or shutters opening into the street. And they pick up those who die in the streets, having public attendants for this.

51.1 Also chosen by lot are 10 market managers (*agoranomoi*), five for Piraeus and 5 for the city proper. These are commanded by the laws to take care of all things sold, so that they will be sold pure and unadulterated. |51.2| Also chosen by lot are 10 managers of weights and measures (*metronomoi*), five for the city proper, 5 for Piraeus, and these take care of all measures and weights, so that the sellers will use standards that are just. |51.3| There used also to be 10 grain guardians (*sitophulakes*) chosen by lot, five for Piraeus, five for the city proper, but now there are twenty for the city proper, fifteen for Piraeus. These take care, first, that the unground grain in the market be sold justly, then that the millers sell barley meal in accord with the price paid for the barleycorns and the bread-sellers their loaves in accord with the price paid for the wheat, and at the weight that the grain guardians assign, for it is them that the law tells to assign it. |51.4| They

choose by lot ten caretakers of the market. These men are ordered to take care of the markets, and to force the importers to convey to the city proper two-thirds of the grain brought by ship to the grain market.

52.1 They also appoint by lot the Eleven, who are to take care of those in the prison, and to punish with death the thieves, kidnappers, and highwaymen brought in under summary arrest, if they confess; but if they dispute it, they are to present them in court, and if they are acquitted to let them go, but if not, then to put them to death. They are also to present in court the lands and houses registered for confiscation, and to hand over to the commissioners for public contracts things judged to be public. And they are to present the denunciations, for it is the Eleven who also present them, though the thesmothetae also present some denunciations. |52.2| They also choose by lot presenters (*eisagôgeis*), 5 men who present the monthly suits, each one for two tribes. The monthly suits are for a dowry, if someone owes it and does not pay; if anyone borrows at a drachma interest[123] and defaults; if anyone wishing to work in the market borrows capital from someone; further, suits concerning assaults, friendly loans, partnerships, slaves, yoke animals, ship commanders,[124] and banking. |52.3| These men present these, then, and try them as monthly suits, while the receivers (*apodektai*) present suits by tax collectors and against tax collectors, having authority in cases up to ten drachmas, and presenting the others in court as monthly suits.

53.1 They also choose by lot the Forty, four from each tribe, before whom other suits are brought. Previously, they were thirty, and went around the demes judging cases, but after the oligarchy of the Thirty they became forty. |53.2| In cases up to ten drachmas they have final authority to judge, but cases over that valuation they hand over to the public arbitrators (*diaitêtai*). They take over these cases and, if they cannot bring the parties to a resolution, decide them, and if the decisions are satisfactory to both sides and they abide by them, the case is completed. But if either of the litigants appeals to the court, they insert the testimonies, challenges, and laws into clay jars, those of the prosecutor and those of the defendant separately, seal these up, attach the judgment of the arbitrator written on a board, and hand them over to the 4 who are trying cases for the tribe of the defendant. |53.3| These men take them over and present them in the court: those up to a thousand drachmas to a court of two hundred and one, those over a thousand to a court of four hundred and one. It is not possible to use laws, challenges, or testimonies except those inserted in the clay jars by the arbitrator. |53.4| The arbitrators are men in their sixtieth year: this is clear from the archons and the eponymous heroes; for there are ten eponymous heroes of the tribes, and forty-two heroes of the age-groups. The ephebes,[125] when they were being registered, used to be

123. Per mina.
124. 61.1.
125. 42.1.

registered on whitened boards, together with the name of the archon in whose year they were registered and the hero of the age-group which had provided the arbitrators of the previous year. Now, though, they are registered on a bronze pillar, and the pillar is set up in front of the council house, near the [statues of the] tribal heroes. |53.5| Taking the last of the eponymous heroes the Forty distribute the arbitrations to the men and draw lots as to which of the cases each one is to arbitrate. And it is necessary for the arbitrators to complete the arbitrations that each one has been assigned by lot. For the law orders that if anyone fails to become arbitrator when his age-group is reached, he is to be deprived of his citizen status, unless he happens to be holding some office or else to be abroad: these alone are exempt. |53.6| It is possible to make an indictment to the group of arbitrators if one is wronged by the arbitrator, and if they convict anyone, the laws order that he be deprived of his citizen status; but appeal is possible for these men too. |53.7| They use the eponymous heroes also for military campaigns, and when they send out an age-group they prescribe which age-groups, dating from one archon and hero to another, must go on the campaign.

54.1 They also choose by lot the following officials. Five road-builders, who are charged with repairing the roads, having at their disposal public workmen. |54.2| And ten auditors (*logistai*) and ten advocates (*sunêgoroi*) for them, before whom it is necessary for all those who have held offices to render their accounts. For these men alone audit the accounts of those subject to inspection and present the inspections in the court. And if they establish that someone is embezzling, the judges condemn him for embezzlement, and he pays the amount decided tenfold. And if they show that someone has taken gifts as bribes and the judges condemn him, they assess the size of the gifts, and this too is paid tenfold. If they condemn for [other sorts of] injustice, they assess the injustice done, and this is repaid simply if someone pays before the 9th prytany.[126] If not, it is doubled. But the tenfold payment is not doubled. |54.3| They also choose by lot the secretary (*grammateus*), called "the secretary by the prytany," who has authority over the documents, guards the decrees that have been passed, copies down everything else, and sits in attendance on the council. Previously, he was elected, and they used to elect the best-reputed and trustworthy men; indeed, he is recorded on the marble pillars concerned with alliances, agents, and grants of citizenship. Now he is chosen by lot. |54.4| They also choose by lot another secretary "for the laws," who sits in attendance on the council, and he also copies down all the laws. |54.5| And the people elect a secretary to read things aloud to them and to the council, and he has authority over nothing except the reading. |54.6| The people choose by lot ten performers of sacred rites (*hieropoioi*), called "for the expiatory sacrifices," who perform the sacrifices ordered by oracles, and if there is a need to seek favorable omens, they seek favorable omens together with the prophets. |54.7| The people also choose by lot ten others, those called "yearly," who perform certain sacrifices and manage all the four-year festivals except the Panathenaea.

126. 47.3.

The four-year festivals are, first, that to Delos, where there is also a seven-year festival, second, the Brauronia, third, the Heracleia, fourth, the Eleusinia, and fifth, the Panathenaea; and none of these occur in the same year. Now the Hephaestia has also been added, in the archonship of Cephisophon.[127] |54.8| They choose by lot an archon for Salamis and a demarch[128] for Piraeus, who conduct the Dionysia in each place and appoint the patrons (*chorêgoi*). In Salamis the name of the archon is also written up.

(O) The Archons (55–59)

55.1 Those officials are chosen by lot and have authority over all the matters stated. As for those called "the nine archons," the way in which they were initially appointed has been stated. Now they choose by lot six thesmothetae,[129] a secretary for these men, and, further, an archon, a king archon, and a polemarch, one of them in turn from each tribe. |55.2| These are examined first in the council of 500, except for the secretary. He is examined only in a court like the other officials (for all the officials, both the ones chosen by lot and the ones elected, take office only after being examined). The nine archons, on the other hand, are examined in the council and again in a court. Previously, anyone the council rejected in the examination did not take office, but now there is appeal to the court, and this has authority over the examination. |55.3| When they examine them, they first ask "Who is your father and from which of the demes, and who is the father of your father, and who is your mother, and the father of your mother, and from which of the demes?" After that, they ask if he has a cult of Ancestral Apollo and Household Zeus and where these shrines are; then if he has family tombs and where these are; then if he treats his parents well, pays his taxes, and has performed his military service. When they have asked this, [the official in charge] says, "Call the witnesses to these things." |55.4| When the candidate has provided his witnesses, he asks, "Does anyone wish to accuse this man?" If there is an accuser, he grants an accusation and a defense, and then grants a vote by hand in the council or by ballot in the court. If nobody wishes to accuse, he immediately grants the ballot. Previously, one man threw in his ballot, but now it is obligatory for all to vote about them, so that if some wicked man has gotten rid of his accusers, it would be for the judges to reject him at his examination. |55.5| Having been examined in this way, they proceed to the stone on which the cut-up sacrificial animals are placed, and on which also the arbitrators, having sworn, declare their arbitrations and witnesses swear their testimony under oath. Climbing up on this, they swear that they will exercise their office justly and in accord with the laws, and not take gifts as bribes on account of their office, and if they do take something, to dedicate a gold statue. From there, those who have sworn proceed to the Acropolis and there swear the same things again, and after that they enter office.

127. 329/8 BC.
128. 21.5.
129. 3.4–5, 63–65.

56.1 The archon, the king archon, and the polemarch each take two assistants, whomever they wish, and these are examined in the court before assisting, and they submit inspections when they have finished assisting. |56.2| And the archon, immediately on entering office, first proclaims that all the things anyone had before he entered office he will have and control until the end of his office. |56.3| Next, he appoints three patrons from the richest men of all the Athenians for the tragedians. Previously, he also appointed five for the comic dramatists, but now the tribes supply these. Next, he receives the patrons provided by the tribes for the Dionysia, for men, boys, and comic dramatists, and for the Thargelia, for men and boys (those for the Dionysia are appointed by tribe, those for the Thargelia one for two tribes and each of the two tribes supplies the patron in rotation). For these he conducts exchange of property trials (*antidôseis*) and presents claims for exemption from public service (*skêpseis*), if anyone says that he has done this public service previously, or that he is exempt because he has done another public service and his period of exemption has not yet expired, or that he is not yet of the age required (for a man who is a patron for boys must be over forty). The archon also appoints patrons for Delos and the chief of a sacred mission (*architheôros*) for the thirty-oar ship that takes the young men. |56.4| He takes care of processions: that for Asclepius, when the initiates stay at home, and for the Great Dionysia together with the caretakers (*epimelêtai*)—previously the people elected ten caretakers and they used to pay for the expenses for the procession by themselves, but now they choose by lot one for each tribe and give a hundred minas toward the equipment. |56.5| He also takes care of the procession to the Thargelia and that for Zeus the Savior. He also administers the competitions at the Dionysia and the Thargelia. These, then, are the festivals that he takes care of. |56.6| Public writs (*graphai*) and private suits (*dikai*) are also assigned by lot to him, which, after holding a preliminary hearing (*anakrisis*), he presents in the court: for mistreatment of parents (these cases are without penalty for whoever wishes to prosecute); for mistreatment of orphans (these are against the guardians); for mistreatment of an heiress (these are against guardians and husbands); for mistreatment of an orphan's estate (these are also against the guardians); for insanity, if anyone accuses someone of wasting his ancestral estate while insane; for the appointment of liquidators (*datêtai*), if anyone is not willing to have common property distributed; for the appointment of a guardian; for a suit to decide between claimants (*diadikasia*) to a guardianship; for settlement in open court;[130] for registering oneself as a guardian; for suits pertaining to inheritances (*epidikasiai*) and to heiresses. |56.7| He also takes care of orphans and heiresses, and of women who claim to be pregnant when their husbands die; and he has authority to impose penalties on those who do injustice, or to present them in court. He also leases out the estates of orphans and heiresses until they are fourteen; and he receives the valuations [of the land that lessees provide as security]; and if the guardians do not provide food for the boys, he exacts it.

130. Requiring the production of property or title for the judges and claimants to see.

57.1 These are the things the archon takes care of. The king archon, first, takes care of the Mysteries along with the caretakers whom the people elect, two from all Athenians, one from the Eumolpidae and one from the Ceryces. Next, of the Dionysia at the Lenaean. This is a procession and a contest. The king archon and the caretakers together send off the procession, while the king archon organizes the contest. He also arranges all the torch contests, and he manages (one might almost say) all the ancestral sacrifices. |57.2| Public suits are brought before him: for impiety and if anyone has a dispute with someone about a priesthood. He also adjudicates all disputes over sacred matters for the families and the priests. Also, all the private suits for homicide are brought before him, and he is the one who makes the proclamation of exclusion from the things specified in the laws.[131] |57.3| Private suits for homicide and wounding, if anyone kills or wounds with premeditation, take place at the Areopagus, and for administering poison, if the person administering it kills, and for arson; for the council [of the Areopagus] tries only these cases. Trials for involuntary cases, for conspiracy, and if anyone kills a servant, a resident alien, or a foreigner, are at the Palladium. If anyone admits to having killed, but says that it was in accord with the laws, such as catching a seducer, in ignorance in war, or while participating in an athletic contest, they judge his case at the Delphinium. If he has gone into exile for an offense that admits of reconciliation and is accused of killing or wounding someone, they try him at Phreatus. He defends himself in a boat anchored near the shore.[132] |57.4| The 51 men appointed by lot judge these cases, except when trials take place at the Areopagus: the king archon presents the case, and they judge them in a holy place and in the open air, and when the king archon judges them he takes off his crown. The accused at other times is excluded from the holy places, and it is not lawful for him to encroach upon the marketplace; but at this time he goes into the holy place and defends himself. When the prosecutor does not know who did it, he obtains a hearing against "the [unknown] doer." The king archon and the tribal kings[133] also judge cases against inanimate objects and animals other [than human beings].[134]

58.1 The polemarch makes the sacrifices to Artemis the Huntress and to Enyalius, he organizes the funeral contest over those who have died in war, and he performs the heroes' rites for Harmodius and Aristogeiton. |58.2| Private suits—for resident aliens, for foreigners allowed to rank with citizens in some respects (*isoteleis*), and for agents—are brought before him alone: he must take these, divide them into ten parts, and deliver to each tribe one part assigned by lot, and those judging for each tribe must hand them over to the arbitrators. |58.3| For resident aliens he presents suits for quitting their sponsor or not having a sponsor, and for estates and heiresses, and however many other things the archon does for citizens, the polemarch does for the resident aliens.

131. On the assumption that if the accused is guilty he is polluted (*miasma*) and a danger to the city.
132. To protect Attica from being contaminated by the pollution thought to adhere to murderers.
133. 8.3, 41.2.
134. Either of which might be polluted by bloodshed.

59.1 The thesmothetae first have the authority to prescribe the law courts, on what days they must hold trials, and then of assigning cases to the officials; for as they assign them, so the officials deal with them. |59.2| Next, they present indictments for those who bring indictments to the people, all hostile votes, preliminary accusations,[135] writs of illegality and for passing an unsuitable law, those against presiding officials and chairmen,[136] and inspections for generals. |59.3| Also directed to them are public writs in which a deposit is paid by the prosecutor: for being a foreigner [while posing as a citizen]; for bribery by a foreigner, when through bribery someone escapes the charge of being a foreigner; for sycophancy; for bribery; for false registration [of someone as a public debtor]; for false attestation [that someone had been summoned by a court]; for failing to delete a discharged debtor from the list; for failing to register someone [as a public debtor]; and for adultery. |59.4| They also present the examinations for all the officials, and [appeals by] men rejected as citizens by their demesmen, and convictions forwarded from the council. |59.5| They also present private suits, trading suits, mining suits, and suits against any slave who speaks badly of a free man. And these men also assign by lot the private and public courts to the officials. |59.6| They also ratify the judicial treaties with [foreign] cities, and present the suits arising from these treaties, and charges of false witness from the Areopagus. |59.7| All the nine archons choose by lot the judges, the tenth being the secretary of the thesmothetae, each from those of his own tribe.

(P) The Commissioners of Games (60)

60.1 Matters concerning the 9 archons, then, are arranged in this way. The people also choose by lot ten men as commissioners of games (*athlothetai*), one from each tribe. After undergoing their examinations, they hold office for four years, and they manage the Panathenaic procession, the music contest, the gymnastic contest, and the horse race, they have the robe for the Parthenon Athena made, and together with the council [of Five Hundred] have the amphoras made, and give the olive oil to the athletes. |60.2| The olive oil is collected from the sacred olive trees. The archon levies it from those who possess the lands where the sacred olive trees are, three half-cotyles from each plant. Previously, the city used to sell the fruit, and if anyone dug up a sacred olive tree or cut one down, the council of the Areopagus judged him, and if they should condemn him, they punished him with death. But ever since the owner of the land pays the olive oil as a tax, though the law remains, the trial has gone out of use, and the city [now] gets the olive oil on the basis of the property, not on the basis of the [individual] plants. |60.3| The archon collects what was produced under him and hands it over to the treasurers up on the Acropolis, and it is not permitted to go up to the

135. 43.5.
136. 44.2–3.

Areopagus before he has handed over all of it to the treasurers. During the rest of the time, the treasurers watch over it on the Acropolis, but at the Panathenaea they measure it out to the commissioners of games, and the commissioners of games to those of the competitors who win. There are prizes for those who win in the music contest, silver and gold objects, shields for those in manliness, and olive oil for those in the gymnastic contest and the horse race.

(Q) Military Officials (61)

61.1 They also elect all the officials for war, ten generals: previously, one from each tribe, now from everyone. And these they assign by voting: one over the hoplites, who commands the hoplites when they go out; one over the land, who guards it, and, if there is war in the land, he wages it; two in charge of Piraeus, one for Munichia and one for Acte, who take care of guarding the things in Piraeus; one in charge of the taxation group contributors to Athens' navy (*summoriai*), who registers those serving as patrons and commanders of a ship, conducts exchanges of property trials for them, and presents suits for them. The others they send out for current business. |61.2| There is a vote about them in each prytany, to see if they seem to be exercising their office well. And if they vote against anyone, they try him in court, and if he is convicted, they assess what he must suffer or pay, but if he is acquitted, he holds office again. When they are commanding, they have authority to fetter a disorderly man, to dismiss him and impose a fine; but they do not usually impose a fine. |61.3| They also elect ten regimental commanders, one from each tribe; he leads his tribesmen and appoints the company captains (*lochagoi*). |61.4| They also elect two cavalry commanders in chief, from everyone; these men lead the cavalry, choosing 5 tribes each; they have authority over the same things as the generals over the hoplites. There is also a vote in the case of these men. |61.5| They elect also 10 commanders of the tribal regiments of cavalry, one per tribe, to lead [the cavalry regiments] just as the regimental commanders do the hoplites. |61.6| They also elect a cavalry commander in chief for Lemnos, who takes care of the cavalry on Lemnos. They also elect a treasurer for the [sacred trireme named] Paralus and another[137] one for the Ammonos.

(R) Concluding Note on Officials (62)

62.1 Of the officials chosen by lot, some used to be chosen by lot with the nine archons from the whole tribe, while those chosen by lot in the Theseum were chosen on the basis of a distribution to the demes. But, since the demes were selling [the offices], these

137. Reading ἄλλον.

officials too were chosen by lot from the whole tribe, except the councilors and the guards; these they give to the demes. |62.2| Wages are paid, first, to the people, for the other assemblies, one drachma, for the assembly with full authority, nine obols. Then to the courts, three obols. Next, the council, five obols. To the prytanes for food, an obol is added. Then the nine archons take four obols each for food and in addition maintain a herald and a piper. Then the archon for Salamis, a drachma a day. The commissioners of games dine in the Prytaneum during the month of Hecatombaeon,[138] when the Panathenaea occurs, beginning from the fourth of the month. The officials with financial responsibility for the sanctuary at Delos take a drachma for each day from Delos. All the officials sent to Samos, Scyros, Lemnos, or Imbros receive silver for meals. |62.3| It is possible to hold the war offices more frequently, but none of the others, except to serve as councilor twice.

(S) Courts (63–69)

63.1 The 9 archons allot the courts, according to tribe, with the secretary of the thesmothetae [doing so] for the tenth tribe.[139] |63.2| There are ten entrances to the courts, one for each tribe, and twenty allotment machines (*klêrôtêria*), two for each tribe, and a hundred boxes, ten for each tribe, and other boxes, into which the tablets of the judges appointed by lot are thrown, and two water pots. And staves are set up beside each entrance, as many as there are jurors, and acorns are thrown into the water pot, equal in number to the staves, and letters are written on the acorns, starting from the eleventh letter *lambda*, as many as there are courts to be filled. |63.3| Serving as judges is permitted to all those who are over 30 years old and not indebted to the public treasury or deprived of their citizen status. If anyone serves as a judge who is not permitted to, he is liable to a denunciation to a public official and is presented in court. If he is convicted, the judges impose on him whatever he seems to deserve to suffer or pay. If he is assessed money, he must be imprisoned until he pays the previous debt for which he was denounced as well as the further penalty that the court imposed on him. |63.4| Each judge has his boxwood tablet, which is inscribed with his name, patronymic, and deme, and one of the letters of the alphabet up to *kappa*; for the judges have been distributed by tribes into ten parts, around the same number under each letter. |63.5| When the thesmothetae allots the letters that are to be attached to the courts, the attendant takes and affixes to each court the letter allotted to it.

64.1 The ten boxes are placed before the entrance for each tribe; the letters up to *kappa* are inscribed on them. When the judges have deposited their tablets into the box on which the same letter is inscribed as on his tablet, then, after the attendant has shaken

138. Mid-June–mid-July.
139. 59.7.

the boxes, the thesmothetae draws from each box one tablet. |64.2| This man is called the "inserter," and he inserts the tablets from his box into the column [on the allotment machine] to which the same letter is applied as on the box. He is chosen by lot, in order that the same man not, by always doing the inserting, do evil. There are five columns in each of the allotment machines. |64.3| When he has deposited the cubes [into the machine], the archon draws lots for the tribe in accord with the allotment machine. The cubes are bronze, black, and white. As many white cubes are deposited as there are judges to be appointed by lot, one cube for each five tablets; and the black ones in the same way. When the archon has taken out the cubes, the herald calls out those who have been allotted; the inserter is also included in their number. |64.4| The one who is called responds, draws an acorn from the water pot, holds it out with the letter uppermost, and shows it first to the archon in charge. The archon, when he has seen it, deposits the man's tablet in the box on which the same letter is inscribed as on his acorn, in order that he enter the one court he has been allotted to and not the one he wishes, and that those someone wishes not gather together in a court. |64.5| Placed beside the archon are as many boxes as there are courts to be filled, each box having the letter that was assigned by lot to each court.

65.1 The judge, having shown again his acorn, [this time] to the attendant, then goes inside the barrier. The attendant gives him a staff of the same color as the court with the same letter as on his acorn, so that it be necessary for him to enter the court to which he has been allotted. For if he enters another one, he is exposed by the color of his staff. |65.2| For on the lintel of the entrance to each of the courts a color has been painted. Taking his staff, the judge proceeds to the court with the same color as his staff, and having the same letter as on his acorn. When he has entered the court, he receives on behalf of the people a token from the man who was allotted this office. |65.3| Then, holding their acorn and their staff the judges sit down, having entered the court in this way. To those rejected in the lottery, the inserters give back their tokens. |65.4| The public attendants hand over the boxes from each tribe, one for each court, in which are the [tablets with] the names from the tribe in that particular court. They hand these over to those appointed by lot to give them back to the judges in each court, five in number, so that they can call the judges from these and give them their pay.

66.1 When all the courts are full, 2 allotment machines are placed in the first of the courts, and bronze cubes on which are painted the colors of the courts, and other cubes on which the names of the officials are written. Two of the thesmothetae appointed by lot deposit the cubes separately from each other: one deposits the colors into one allotment machine, the other deposits the names of the officials into the other. The official who is allotted first, it is announced by the herald, is to use the first court that is allotted, and the second the second, and so on for the remainder, so that no official knows in advance which of them he is to use, but each use the one that is allotted to him. |66.2| When the judges have entered and have been distributed into the particular

courts, the official in charge of each court draws one tablet from each box, in order that there be ten, one from each tribe, and he deposits these tablets in another empty box. And of these he allots the first 5 lots, one for the water clock and four others for the ballots, in order that no one can suborn either the man in charge of the water clock or the men in charge of the ballots, and that there be no fraudulence about this. |66.3| The five who have not been allotted receive from the presiding officials written instructions about[140] how they are to receive their pay, and where in the courtroom itself each of the tribes is to do so, when they have judged, so that by having each tribe separated, they can receive their pay in small groups, and not, by having many confined in the same place, trouble each other.

67.1 Having done this, they call in the suits: when they are trying private matters, they call in the private suits, 4 in number [per session], one of each sort of private suit prescribed by the law, and the opposing litigants swear to speak to the point; when public matters, public suits, and they judge only one case [per session]. |67.2| There are water clocks with outflow pipes, into which they pour the water against which one must speak in private suits. Ten choes[141] are granted for suits over five thousand drachmas, and three choes for the second speech; seven choes for those up to five thousand, and two choes [for the second speech]; five choes for those within 1,000, and two choes [for the second speech]; six choes for cases with rival claims and there is no [second] speech. |67.3| The man appointed by lot to the water clock stops the pipe whenever the secretary is about to read a decree, law, testimony, or contract. But when the private suit is measured on the basis of a day, he does not stop; it; instead, an equal amount of water is given to the prosecutor and the defendant. |67.4| It is measured on the basis of the days of Poseidon,[142] for they are also compatible with the others. They use 11 amphoras, which are distributed in fixed portions. The judge [in charge of the water clocks] sets aside three amphoras for the voting, and each party takes an equal share of the rest. For previously [the prosecutors] were eager to force the defendants into a very small share of the time, so they take the remaining water; but now there are two jars, one for the prosecutors, the other for the defendants. |67.5| In previous times he took out some water for the second vote. The day is divided for the public suits for which there is a penalty of imprisonment, death, exile, being deprived of citizen status, confiscation of property, or there has to be an assessment of what the culprit has to suffer or pay.

68.1 Among the law courts, the public ones consist of 501 judges, to which they give the judging of the lesser cases. When they need to present the greater public cases before 1,000, two courts are brought together into the Eliaia,[143] and for the greatest suits, 3 courts are united before 1,500. |68.2| The ballots are bronze, with a tube through

140. Reading τὸ πρόγραμμα. There is a hiatus in the papyrus.
141. One *chous* is roughly three or four minutes.

143. The largest court in Athens.

the middle, half hollow and half solid. When the speeches have been delivered, the judges appointed by lot for the ballots hand over two ballots to each of the judges, a hollow and a solid, out in the open for the opposing litigants to see, in order that the judges not receive two solid or two hollow ones. Then the man appointed by lot for this task takes away the staves, in exchange for which each judge receives a bronze token marked with gamma when he casts his vote (for on returning that he receives 3 obols), so that all shall vote; for it is not possible for anyone to take a token unless he does vote. |68.3| There are two amphoras standing in the court, a bronze one and a wooden one, so perforated that no one escape notice depositing ballots, and the judges cast their ballots into these: the bronze amphora is the authoritative one and the wooden is the one that is not authoritative, and the bronze one has a pierced attachment such that only one ballot can pass through it, so that the same man cannot deposit two ballots. |68.4| When the judges are about to vote, first, the herald asks whether the opposing litigants challenge the testimonies (for it is not possible to make a challenge when they have started to vote). Then he proclaims again, "The hollow ballot is for the man who spoke before, and the solid is for the man who spoke later." The judge takes his ballots from the lamp-stand, covering the tube of the ballot and not showing the hollow or the solid tube to the contestants, and deposits the authoritative ballot in the bronze amphora, and the non-authoritative one in the wooden.

69.1 When they have all voted, the attendants take the authoritative amphora and empty it onto a board with as many holes as there are ballots, in order that both the hollow ones and the solid ones may be laid out openly and easily counted. The men appointed by lot to take charge of the ballots count them on the board, the solid ones and the hollow ones separately, and the herald announces the number of the ballots, the hollow for the prosecutor and the solid for the defendant: whichever has the greater number wins, and if they are equal, the defendant does. |69.2| Then again they assess the damages, if an assessment is needed, voting in the same way, giving up their token and taking their staff again. Speeches on the assessment are made against a half allowance of the water clock for each. When they have completed the trials prescribed by the laws, they receive their pay in the place assigned to each by lot.

FRAGMENTS*

INTRODUCTION

It was widely agreed in antiquity that Aristotle was the author of a variety of works, besides the extant treatises, including dialogs, polemics, notes, poems, and letters. Our information about these works survives only in reports, quotations, and paraphrases in other ancient texts, as well as some fragmentary papyri. Only a very few of these contain Aristotle's own words. Though the judgment of their authenticity is a vexed and difficult question, there is strong evidence that the fragments included here by and large represent Aristotle's thought, at least at some stage in his career. Moreover, they both illuminate the works that have been preserved in their entirety and discuss issues that are otherwise unreported. The extensive critique of Platonic Forms in *On Forms* (F173–176), alluded to in the *Metaphysics* and preserved only by Alexander of Aphrodisias, is an example of the former, the dialog *On Justice* in four books (F120–125), which attempted to defend justice in a manner not unlike that of Plato's *Republic*, an example of the latter. Perhaps more tantalizing are the points at which the fragments appear to contradict attested views from elsewhere in the corpus. The clearest case of this is the *Eudemus* (F68–80), which seems to have proposed views about recollection and the immortality of the soul close in spirit to Plato's *Phaedo*.

1. Dialogs

TESTIMONIES ON THE DIALOGS

F1 *Cicero,* Letters to Atticus *4.16*

I use proems for individual books, as Aristotle did in the works he called "exoteric."

F2 *Basil,* Letter *135*

Even among the pagan philosophers who have composed dialogs, Aristotle and Theophrastus have dealt at once with the things at issue themselves, because they were conscious of their lack of Platonic grace. But Plato, by the power of his writing, at one and the same time both battles beliefs and incidentally ridicules the people.

F3 *Ammonius, On Aristotle's* Categories *6.29–7.4*

In the dialogs, which he wrote for ordinary people, [Aristotle] takes thought for a certain loftiness and abundance of style and metaphor, and he shapes the form of the style

* Translated and introduced by Justin Vlasits. Text: V. Rose, *Aristotelis qui ferebantur librorum fragmenta,* 3rd ed. (Leipzig, 1883), unless otherwise indicated. Fragments preceded by an asterisk are not in Rose; those in Rose are sometimes presented in less or more extended versions.

according to the personalities of the speakers, and simply whatever he knew would embellish the form of the language.

F4 *Themistius,* Orations *26.319c–d*

[Of Aristotle's works], those that are for public consumption and had been prepared for the majority of people are full of light and radiance, and their benefit is not at all unenjoyable or unpleasant, but Aphrodite pours herself out and the Graces bloom.

F5 *Elias, On Aristotle's* Categories *124.3–6*

In the dialogs . . . [Aristotle] produces variety with his imitations, full of Aphrodite and filled with the Graces.

F6 *Cicero,* Letters to Atticus *13.19*

The works I am writing in the present times follow the *Aristotelian* manner, in which the conversation of others is so represented as to leave him the main part.

F7 *Elias, On Aristotle's* Categories *115.3–5*

Alexander says that another difference between the lectures and the dialogs is that in the lectures [Aristotle] says what seems so to him and the truth, whereas in in the dialogs he says what seems so to others and is false.

F8 *Cicero,* On Ends *5.12*

Since there are two genres of [Peripatetic] books, one written for a popular audience, which is called *exôterikon* ["exoteric"], the other written for a limited audience, which are the ones they left behind in notes, they do not always seem to say the same thing [about the highest good].

F9 *Aristoxenus,* Elements of Harmony *30–31*

Just as Aristotle always used to relate, the majority of Plato's students attended the lecture on the good. Each was coming with the expectation that they would grasp something about those things that are considered to be human goods: wealth, health, strength, and, in general, some sort of wondrous happiness. But when the arguments were found to be about sciences, numbers, geometry, astronomy, and, in short, that the good is one, I think it appeared completely unacceptable to them. Thus, some came to despise the thing, while others found fault with it.

1.1 *ON PHILOSOPHY*

F10 *Priscian of Lydia,* Answers to King Chosroes of Persia *14.41–42 (Bywater)*

For it is from Plato's *Timaeus* . . . received and completed by Aristotle's works *Physics*, *De Caelo, On Coming to Be and Passing Away*, and *Meteorology*, and similarly from

those works *On Sleep and Dreams* and those that are written as though as dialogs *On Philosophy* and *On Worlds.*

F11 **Philodemus,* On Piety *PHerc 1077 col. 38, 1089–1099 (pp. 180–181 Obbink)*[1]

Polyaenus, in the first book of *Against Aristotle's On Philosophy*, declares that the divine nature is the cause of good things for us.

F12 **Asclepius, On Aristotle's* Metaphysics *112.16–19 (993ª22)*

Indeed, [Aristotle] says, we have also spoken about these starting-points[2] in the *Physics*. Then he promised to speak about them in *Metaphysics 2* and discuss and solve puzzles about them in *On Philosophy*.

F13 *R1 Plutarch,* Against Colotes *1118C7–11*

The most divine of the inscriptions in Delphi was apparently "know thyself," which gave Socrates the start to his puzzlement and investigation, as Aristotle says in his Platonic works.

F14 *R2 Diogenes Laertius 2.23*

Aristotle says that Socrates went to the Pythia, but also to the Isthmus [of Corinth], as Favorinus says in the first book of the *Recollections*.

F15 *R3A John Stobaeus 3.21.26.1–16 (Hense)*

Porphyry from Book 1 of *On Know Thyself*: What precisely, and from whom, was the sacred command in the Pythia, which bids those who will beg anything from the god[3] to know thyself? . . . Or else it was Phemonoe . . . or Phanothea . . . or else it was set up by Bias, Thales, or Chilon, moved by some divine inspiration, as a votive offering. Or one must instead pay heed to Clearchus, who declares it to be an instruction of the Pythia, and to have proclaimed to Chilon, who heard it, to learn the most important thing for human beings. Or it was recorded even before Chilon in the temple that was established after the one made of feathers and the other made of bronze, just as Aristotle said in the works *On Philosophy*.

F16 *R3B Clement of Alexandria,* Stromata *1.14.60.3*

Some suppose that the phrase "know thyself" is by Chilon; Chamaeleon, in *On Gods*, supposes that it is by Thales, and Aristotle that it is by the Pythia.

1. Text: D. Obbink (ed.), *Philodemus On Piety* (Oxford, 1997).
2. I.e., matter and form.
3. Apollo.

F17 *R4 Clement of Alexandria,* Stromata *1.14.61.1–2*

And, again, they attribute the "nothing in excess" to Chilon the Spartan. . . . But those around Aristotle considered ["Make a pledge and you are ruined"] to have been made by Chilon, and Didymus says that the exhortation is by Thales.

F18 *R5* Etymologicum Magnum *722*

"Sophist": most properly someone being sophistical. But Aristotle calls the Seven Sages "sophists."

F19 *R6 Diogenes Laertius 1.8*

Aristotle, in the first book of *On Philosophy*, also says that [the Magi] are older than the Egyptians. And according to them there are two starting-points: a good daimon and a bad daimon, and the name for the former is Zeus or Oromasdes [= Ahura Mazda] and for the latter Hades or Areimanius [= Angra Mainyu].

F20 *R7A John Philoponus, On Aristotle's* De Anima *186.23–25 (410^{b}27)*

Aristotle says "so-called" since he believes that the poems are not by Orpheus, as he also says in the works *On Philosophy*. For the doctrines are from Orpheus, but he says that Onomacritus stretched them out into verses.

F21 *R7B Cicero,* On the Nature of the Gods *1.107*

Aristotle teaches that there never was a poet Orpheus and the Pythagoreans attribute this Orphic poem to a certain Cercops.

F22 **Sextus Empiricus,* Against the Physicists *2.45–46*

Some say that there is movement, others that there is not. . . . The associates of Parmenides and Melissus say that there is not. Aristotle called them "immobilizers (*stasiôtai*)" of nature and "non-naturalists": "immobilizers" from immobility (*stasis*), "non-naturalists" because nature is the starting-point of movement, which they annul when they say that nothing moves.

F23 *R8A Proclus, Quoted in John Philoponus,* Against Aristotle on the Eternity of the World *31.17–32.8*

[Aristotle] probably rejected none of Plato's views so much as the hypothesis of Forms. Not only in the logical works . . . , but also in the ethical, . . . the natural scientific, . . . and much more in the metaphysical . . . ones. . . . And in the dialogs he cries out so perspicuously that it is impossible to be sympathetic to this doctrine, even if someone were to think that he is objecting out of a love of contention.

F24 *R8B Plutarch,* Against Colotes *1115B8–C4*

Aristotle called Plato out about the Forms, moving against him everywhere and bringing every puzzle against them in the ethical treatises and the natural scientific ones.[4] But in the exoteric dialogs Aristotle seemed to some to be more contentious than philosophical toward this doctrine, as if he put forward Plato's philosophy in order to despise it. In this way, he was far from following [Plato].

F25 *R9 Syrianus, On Aristotle's* Metaphysics *159.33–160.5 (1086^{a}18–21)*

The fact that [Aristotle] himself agrees that he has said nothing against [the Platonists'] hypotheses, nor does he at all attend closely to Form numbers,[5] if indeed they were to be taken as distinct from mathematical numbers, is witnessed in the following way by the second book of *On Philosophy*: "Thus if the Forms are another sort of number, not the mathematical one, we would not have any understanding of it. For who, at least of the majority of us, understands another sort of number?" So here too he refutes ordinary people who are ignorant of any sort of number other than the monadic number and did not even start to touch upon the thought of the divine men.[6]

F26 **Alexander of Aphrodisias, On Aristotle's* Metaphysics *117.23–118.1 (992^{a}10) (Golitsis)*

The doctrines of [the Platonists] are set forth, which he has also stated in *On Philosophy*. For those who wish to reduce the beings (for he always says the beings are substances), to the starting-points they hypothesize (for them the starting-points of the beings are the great and the small, which they call the "indefinite dyad"), these people, wishing to reduce everything to this, saying that the starting-points of length are the long and the short, since the coming to be of what has length is from something long and short, which are [respectively] great and small, or since every line is in one of these [great and small], while the starting-points of the plane are the wide and narrow, which are themselves great and small [respectively].

F27 **Pseudo Alexander of Aphrodisias (Michael of Ephesus), On Aristotle's* Metaphysics *777.11–21 (1087^{b})*

He [Aristotle] says that, also wishing to introduce magnitudes from the two starting-points (the one and the indefinite dyad), they say that from the two the line takes on the long and short, the plane takes on the wide and narrow, and the solid takes on the deep and shallow. For they call the long and short and the rest "Forms of the great and small in the indefinite dyad," and they all introduce the starting-point in accord with the one, but not in the same way. Some say these same numbers confer the forms on magnitudes, for example, two on line, three on plane, four on solid (for he recounts

4. Rejecting the addition of μετὰ τὰ φυσικά, ἐν τοῖς.
5. E.g., *NE* 1.6, *Met.* 1.6, 1.9.
6. Plato and his followers.

these things about Plato in *On Philosophy*, which is also why he has set out the thought about them here so briefly and summarily), but some completed the Form of the magnitudes by participation in the one.

F28 **Papyrus Aï Khanoum III B 77, P.O. 154 (Auffret)*[7]

Col. II
". . . For don't we say that not only do perceptibles commune with the Forms, but also that the Forms themselves commune with each other?"
"We do," he said.
"Then is it the cause of the fact that the Forms participate in none of the other beings the same as that of the fact that the other things participate in them? . . ."
Col. III
"So due to these same causes is it not necessary that the cause of participation is immovable? For each of the Forms is unchangeable for these reasons and because both the coming to be and passing away of the perceptibles is eternal?"
"Necessarily," he said.
"Nonetheless, this would seem to be the most controlling and primary of the causes?"
"Correct."
"For this is the cause of participation [in the Forms] for all things and for all the Forms in each other. . . ."
Col. IV
". . . [it] would be clearly as bad as possible, if in its position it were to be something that has come to be and were perceptible. Do you understand, at least approximately?"
"Very much so," he said.
"But if it does not participate in any of the Forms, it will be primary. But were it not to participate in the other Forms, it would not be a Form."
"So it seems," he said.

F29 *R10 Sextus Empiricus,* Against the Physicists *1.20–22*

Aristotle said that the notion of the gods came to be among human beings from two starting-points: from occurrences in the soul and from things in the heavens. From the occurrences in the soul because of soul's inspiration during sleep and its prophecies. For whenever, he says, the soul is by itself in sleep, then, having regained its special nature, it prophesizes and foretells the future things. The soul is also this way when it is separated from the bodies at death. He accepts, at any rate, that the poet Homer also observed this. For he made Patroclus, while he was dying, foretell the death of Hector, and Hector [while he was dying] foretell the end of Achilles. From these things, he said, humans surmised that something divine exists, which is intrinsically like the soul and most knowledgeable about all things. And also from the things in the heavens; for

7. T. Auffret, "Un 'nouveau' fragment du Περὶ φιλοσοφίας: le papyrus d'Aï Khanoum," *Elenchos: Rivista di Studi sul Pensiero Antico* (2019): 25–66.

having observed the sun going around during the day, and at night the well-ordered movement of the other stars, they thought that some god existed, which is the cause of such movement and good order. Aristotle is this sort of person.

F30 *R11 Sextus Empiricus,* Against the Physicists *1.26–27*

Some, having recourse to the unalterable and well-ordered movement of the heavens, say that from this movement we first began to have notions of the gods. For just as if someone sitting on Mount Ida in Troy saw the campaign of the Greeks with great order and arrangement advancing on the plains, "cavalry first with horses and chariots, infantry in the rear,"[8] such a person would completely come to the notion that there is someone making this arrangement and ordering those soldiers under his command, such as Nestor or one of the other heroes, who knew how "to put in order the horses and the shield-bearing men."[9] And in the same way someone experienced in sailing, at the same time as he sees a ship far away driven by a fair wind and well set out with all its sails, would understand that there is someone directing it and landing it at the appointed harbors. In this way, those who first looked up at the sky, contemplating the sun running its course from east to west and the sort of well-ordered dance of the stars, sought out the craftsman of this most beautiful design, guessing that it did not happen spontaneously, but rather by some greater and imperishable nature, which was a god.

F31 *R12A Cicero,* On the Nature of the Gods *2.95 (Plasberg)*

Aristotle said brilliantly that if there were people who had always lived under the earth in good and respectable homes, which were decorated with images and pictures and furnished with everything that those who are thought happy held in abundance, but had never been above ground, and they receive by word of mouth a report that there is some sort of divine will and power, then at another time, when a crevice is opened in the earth, they go out from their hidden dwellings into those places which we inhabit and are able to live, when they suddenly see earth, sea, and sky, know the size of the clouds and the power of the winds, and behold the sun and know both its size and beauty as well as its power, as it produces the day by spreading the entire sky with its light, and when night darkens the earth, they discern the whole sky ornately distributed with stars and the varying light of the moon as it waxes and wanes and the risings and fallings of them all and the courses calculated and immutable for all eternity—when they see these things, they would certainly judge there to be gods and that these are all works of gods. And this is what [Aristotle] said.

8. Homer, *Iliad* 4.297–298.
9. Homer, *Iliad* 2.554.

F32 *R12B Philo of Alexandria,* Allegorical Interpretation *3.97–99 (Cohn and Reiter)*

The first [philosophers] inquired about how we got the notion of the gods. Then those with the reputation of doing philosophy in an excellent way said that it is from the cosmos, its parts, and their capacities, that we were made to grasp the cause. For just as if one saw a house carefully crafted with entrances and porticoes, men's and women's quarters, and other parts of a house, one would acquire the notion of a craftsman, for one will not think that the house was completed without craft and a craftsman. And in the same way also for a city and a ship and everything constructed, great or small. Then in this way too, if someone enters into this cosmos (as if it were the greatest house or city), contemplating the heavens moving around in a circle and all things gathered together within it, planets and fixed stars moving in the same way elegantly and in tune and beneficially to all, and earth obtaining the most central place, streams of water and air set in the limit between them, and further the mortal and also immortal animals, various fruits and crops, one will reckon that these had not been produced without complete craft, and thus the craftsman of this universe was and is the god. Those reasoning in this way apprehend the god through [its] shadow, conceiving of the craftsman through his works.

F33 *R13 Synesius,* Praise of Baldness *22.1*

. . . if indeed the proverb too is a wise thing. But how could it not be a wise thing, [since it concerns] those things about which Aristotle says[10] that they are traces of an ancient philosophy, lost through the greatest destructions of humanity, which were preserved on account of their concision and pith.

F34 **John Philoponus,* On Nicomachus' Introduction to Arithmetic *1.1*

Now "wisdom (*sophia*)" is so called as though it were "some sort of perspicuousness (*sapheia tis ousa*)," since it [wisdom] makes all things perspicuous. And this, "the perspicuous (*to saphes*)," is so called as though it were "some shining being (*phaes ti on*)," derived from "luminosity and light (*phaos kai phôs*)," on account of leading hidden things into light.

F35 *R14 Seneca,* Natural Questions *7.30.1*

Aristotle admirably said that we should never be more modest than when the subject turns to the gods. If we only enter temples with composure, if when we approach the sacrifice we bow our head, we carry our toga, if we put on every sign of modesty, how much more should we do so when we dispute about the stars, about the planets, and about the nature of the gods, lest we impudently believe something rashly in ignorance or knowingly lie about something.

10. *Met.* 1074^{a}38–^{b}14.

F36 *R15 Synesius,* Dion *8.6*

As Aristotle claims, those who are being initiated [into mysteries] do not have to learn why something must be so, but be affected by something and be in a certain disposition, obviously, if they have [already] come to be deserving.

F37 **Michael Psellus,* Theologica *30.2, 7–17*

I offered to teach you what I have learned, not what I have been affected by . . . for all writing is divided into these two sorts . . . : the teachable and what is connected with the initiation into mysteries. The former comes to human beings first by hearing, but the latter when the understanding itself is affected by illumination. This is what Aristotle called "mystical" and likened to the Eleusinian mysteries, since in these the initiate was stamped with visions, but not taught. Now, whoever was shown the immortality of the soul through self-movement, this person received learning through teaching, not through initiation. But if someone, seeing it as an eyewitness with his understanding, saw the soul itself (rather than one who is not contemplating the soul directly with his understanding but is shown its immortality), this person was affected [by it] and initiated.

F38 *R16 Simplicius, On Aristotle's* De Caelo *288.28–289.15 (279ª18)*

[Aristotle] says that the fact that the divine is eternal is witnessed by the things brought to light by the arguments put forth in many places in the philosophical works in circulation, namely, that everything divine, being the first and highest of things, is necessarily unchangeable. For if it is unchangeable, it is also eternal. He calls "philosophical works in circulation" those works that, being first according to their arrangement, are addressed to the ordinary people (which we are accustomed to also call "exoteric"), since the esoteric works and treatises are weightier. He speaks about this in *On Philosophy*: for universally the things in which there is something better are the same things in which there is also something best. Since, then, among the beings, one is better than another, there is also, therefore, something that is best, which would be the divine. So if what changes changes either due to another or due to itself and, if due to another, either by something better or something worse and, if it by itself, either by changing toward something worse [than itself] or by seeking something nobler. But neither is there anything greater than the divine by which it will be changed (for then this would be more divine), nor is it right for the greater to be affected by the worse. But even if it were changed by the worse, something base would be added, but there is nothing base in it. Neither does it change itself by seeking something nobler, for it is not in need of its noble things. Nor does it change toward the worse, when not even a human being would willingly make themselves worse, nor does it have any base thing which it would add from the change toward the worse. Aristotle has received this demonstration from the second book of Plato's *Republic*.[11]

11. 380d–381e.

F39 *R17 Scholia on the* Proverbs of Solomon, *Cod. Paris Gr. 174 fol 45v–46f*

From Aristotle: the starting-point is one or many. If it is one, we have what was sought. If many, they are either ordered or unordered. But if they are unordered, what comes from them would be even more unordered and the cosmos would not be a cosmos but an anti-cosmos, and so what is contrary to nature will exist, while what is in accord with nature will not exist. And if they are ordered, either they are ordered from themselves or by some external cause. But if they are ordered by themselves, they have something in common which is what connects them, and this is the starting-point.

F40 *R18 Philo of Alexandria,* On the Eternity of the World *10–11 (Cohn and Reiter)*

Aristotle, objecting [to these views] out of piety and devotion, said that the cosmos cannot come to be or pass away,[12] and condemned the clever ungodliness of those who expound the contrary view, and who suppose that such a visible god, which truly contains the sun, moon, and the rest of the pantheon of the planets and stars, does not differ at all from the works of manual labor. And one can almost hear him railing against them when he says that in the past he feared that his house might be overturned by violent winds, extraordinary storms, time, or neglecting maintenance, but now a greater fear was suspended, a fear of those who destroy the whole cosmos with [their] argument.

F41 *R19 Philo of Alexandria,* On the Eternity of the World *20–24 (Cohn and Reiter)*

The arguments establishing that the cosmos cannot come to be or pass away must, out of reverence toward the visible god, be the first to be arranged and to involve the proper starting-point. For of all things admitting of passing away there are two causes of destruction, one internal, the other external. In any event you could find iron, bronze, and substances of this sort disappearing by themselves whenever rust eats through them as it courses over them in the manner of a shingles-like illness, and from external causes as when a house or a city are set on fire together and are destroyed by the forceful rush of fire. Animals also meet their end in the same sorts of ways, either of themselves from illness or by external things—for example, by having their throat cut, being stoned, being burned, or suffering an impure death by hanging. But if the cosmos too is to pass away, it will be destroyed by either an external capacity or with respect to some capacity within itself. But each of these is impossible. For there is nothing external to the cosmos, since everything is collected to fill it up. For in this way it will be one, whole, and ageless: one, because, had some things been left behind, there would be a distinct cosmos similar to the present one; whole, because all substance together is exhausted in it; and ageless and free from sickness, since bodies that can be conquered by illness and old age are strongly upset by hot and cold and the other external contraries that

12. *Cael.* 1.10.

additionally befall them, and no capacity of these can escape to encircle and attack it, since all of them, no part excepted, have been entirely caught inside. But if then it is something external, it would be entirely void, an impassive nature, which is unable to be affected by anything or do anything. And nor will it be dissolved by some cause internal to it. First, since the part will be greater and mightier than the whole, which is completely absurd. For the cosmos, using unsurpassable might, leads all its parts and is led by none of them. Further, since there are two causes of passing away (internal and external), what can submit to the one is also in every case receptive of the other. A sign of this: cow, horse, human, and similar animals, because they can be destroyed by iron, will also die by illness. For it is more difficult, nay impossible, to find something that, although it can naturally submit to the external cause of passing away, will not be able to admit at all of the internal one. Therefore, since the cosmos was proved not to pass away either by anything external (due to the fact that nothing external to it remains at all) or by anything within it (because of the demonstration stated before, in accord with which what is conquered by one of the causes was also naturally able to admit of the other). . . .[13]

F42 *R20 Philo of Alexandria,* On the Eternity of the World *28–34 (Cohn and Reiter)*

It is also proved in this sort of way: everything among the composites that passes away has its dissolution into the things from which it was composed. Therefore, dissolution is nothing other than the return of each thing to its natural state, so that contrarywise composition would force things to come together contrary to their nature. But now this seems indeed to be completely false. For we humans were blended together from the four elements, earth, water, air, and fire (which wholly constitute the entirety of the heavens), by borrowing small parts [of them]. But when these parts were blended, they were deprived of their natural position: heat, which is upward-moving, is forced down, earthen and heavy substance is lightened and gets instead the upper place, which the most earthen part of us—the head—has occupied. The worst of the bonds, though, is that which force fastens, which being forced is short-lived; for it is broken more quickly by the things that are bound, inasmuch as they shake it off because of longing for their natural movement, toward which they hasten to migrate. For, according to the tragedian,[14] "What has grown from earth goes back to earth, what springs from airy parents returns to the celestial sphere. Nothing that comes to be dies; while one is disaggregated in one direction, another in another, each shows forth its own shape." This law and ordinance has been inscribed for all things that pass away. Whenever the parts that have come together in the blend have settled down, in place of their natural order they have accepted disorder, and migrate to the contrary places, so they seem in a way to live in exile. But whenever they are dissolved, they return to their own naturally assigned

13. Incomplete in the source text.
14. Euripides, Fr. 836 Nauck.

place. But the cosmos is free from the disorder present in the things just mentioned. For let us consider it well. If the cosmos is passing away, its parts at this moment have necessarily been ordered in a place contrary to nature. But it is not lawful to suppose this [of the cosmos]; for all the parts of the cosmos have obtained the best position and harmonious order, since each thing, as if fond of its own fatherland, does not seek out a change for the better. Because of this, the most central place is assigned to earth, to which all earthen things, even if you throw them up, are brought down. This is a sign of a place that is in accord with nature; for that place where something stands and rests, when brought there without force, is its own allotted space. And water has been poured over the earth, and air and fire have been spread from the middle toward the upper place, air being allotted the place bordering water and fire, and fire the highest place. That is why, even if you light a torch and let it fall toward the earth, the flame will nonetheless use force against it, and with the natural movement of fire lifting itself up, rise upward. If, then, the cause of passing away for all other animals is unnatural [place], and in the cosmos each of the parts is ordered by nature, having been allotted its proper place, the universe would be rightly called "incapable of passing away."

F43 *R21 Philo of Alexandria,* On the Eternity of the World *39–43 (Cohn and Reiter)*

The most demonstrative argument, at any rate, is that which I know thousands are proud of, as if it were investigated with exactness and completely irrefutable. For they ask: for what purpose would God destroy the cosmos? It would either be for the sake of no longer engaging in world-making or else for the sake of constructing another one. But the former is foreign to God; for he should change disorder to order, not order to disorder. Then, because God would admit of a change of mind, he would admit of an affection and illness of the soul. For he should either not have made the cosmos at all, or else, judging the work to befit him, rejoice in what has come to be. But the latter is worthy of a non-too-brief inquiry. For if he had constructed another cosmos in place of the present one, the cosmos that would have come to be would, on the whole, have been made worse, similar, or better. Each of these options can be attacked. For if the cosmos were worse, the craftsman too would be worse. But God's works are faultless, uncriticizable, and incorrigible, since they have been created with complete craft and scientific knowledge. "For not even a woman," as they say, "lacks good sense to such an extent that she would choose the worse over the better when present." But it is fitting for the god to give shape to the shapeless and to confer wondrous beauty on the ugliest things. On the other hand, if [the other cosmos] were similar, the craftsman would labor in vain and not differ at all from little children, who often when playing on the beach build mounds of sand, then seize them from below with their hands, and tear them down again.[15] For much better than constructing something similar would be neither to remove nor add anything, nor again change

15. Cf. Homer, *Iliad* 15.360–364.

anything for better or worse, but to leave the cosmos that once came to be at the start in its place. But if he is to craft something better, the craftsman will also become better, so that when he constructed the first cosmos, he was less complete in craft and thought—which is precisely the thing it is not lawful even to suppose. For the god is always equal and similar to himself and admits neither of relaxing toward the worse nor of tightening toward the better.

F44 *R22 Cicero,* Lucullus *38.119 (Plasberg)*

For when your Stoic sage has spelled out these things for you, Aristotle will come, pouring forth a golden river of speech, and would say that the man lacks understanding, since the world never came to be, because there was no beginning, with a newly begun plan, of such a brilliant work and since it is joined everywhere in such a way that no force could bring about such great movements and changes, no old age can come about due to the passage of time, so that this ordered world should ever fall to pieces.

F45 **Lactantius,* The Divine Institutes *2.10.24–25*

If it is possible for [the world] to perish entirely, since it passes away partially, it seems to come to be at some time, and fragility is manifest at the beginning as well as the end. If these things are true, Aristotle could not defend the claim that the world itself has no beginning.

F46 *R23 Cicero,* On the Nature of the Gods *2.15 (Plasberg)*

Since the place of some animate things is on the earth, while of others it is in water or the air, it seems absurd to Aristotle to think that no animal comes to be in that region which is most suitable for animate things to come to be. But heavenly bodies occupy the place of ether. Since this is the finest [substance], always in motion and full of life, it is necessary that some sort of animal comes to be in it that possesses penetrating perception and quick movement. That is why, when stars come to be in ether, it is proper for there to be perception and intelligence in them. From this fact, one is led to believe that the stars must be counted among the gods.

F47 *R24 Cicero,* On the Nature of the Gods *2.16 (Plasberg)*

And indeed Aristotle is to be praised in that he holds that all things that are moved are moved either by nature, force, or voluntarily. But the sun, the moon, and all the stars are moved. However, what is moved by nature is either brought downward by heaviness or elevated by lightness, neither of which befalls the stars, because their movement carries them in a circular orbit. Nor indeed can he say that the movement is generated by some greater force so that the stars are moved contrary to nature. For what force could be greater? It remains that the movement of the stars is voluntary. He who sees these things would not only be ignorant but also impious if he denied that the gods existed.

F48 **Nemesius,* On the Nature of Man *5.52.21-23 (Morani)*

Aristotle also introduced a fifth body, the circular-moving ether, since he did not want the heavens to have come to be out of the four elements. He says that the fifth body is moved circularly because it moves around itself in a circle.

F49 **Aëtius 5.20.1 (Mansfeld and Runia)*

Plato and Aristotle say there are four kinds of animals: terrestrial, aquatic, winged, and celestial, since the stars are said to be animals, as are the cosmos and God—an immortal rational animal.

F50 *R25A Censorinus,* On the Birthday *18.11*

Furthermore, there is the year that Aristotle called "greatest" rather than "great," which the orbits of the sun, moon, and five wandering stars produce when they return to the same constellation, where they once were together.

F51 *R25B Cicero,* On the Nature of the Gods *2.20 (Plasberg)*

In truth the movements of those five stars, which are falsely called "wandering," are the most admirable. . . . It is from their unequal movements that the mathematicians called the "great year" what happens when a revolution of the sun, moon, and five wandering stars is made at the same relative special location among them. It is a difficult question exactly how long it is, but it is necessarily a fixed and definite length.

F52 *R26B Cicero,* On the Nature of the Gods *1.33 (Plasberg)*

Aristotle in the third book of *On Philosophy* creates much confusion when he disagrees with his master Plato. For sometimes he assigns all divinity to mind, sometimes he says that the world itself is a god, sometimes he sets another god over the world and assigns to it the functions to govern and preserve the world's movement by a certain "winding." Then he says that the heat of the heavens is a god, without understanding that the heavens is a part of the world, which he himself in another place says is a god. But in what way can that divine perception of the heavens be preserved while it moves so quickly? Where, then, are all these gods, if we also count the heavens among the gods? But when he wants to say that the same god is without body, he strips it of all sense perception as well as practical wisdom. Moreover, in what way can it be moved while it lacked a body, and in what way can it be at rest and blessed if it is always moving itself?

1.2 *ON THE GOOD*

F53 *Simplicius, On Aristotle's* De Anima *28.6–9 (404^{b}18)*

Concerning philosophy, he now states the things recorded by him from Plato's conversations, in which he recounts the beliefs of the Pythagoreans and Platonists about the beings.

F54 *John Philoponus, On Aristotle's* De Anima *75.34–76.1 (404^{b}18)*

The work entitled *On the Good* speaks about philosophy. In it, Aristotle recounts Plato's unwritten conversations. The book is genuinely by him. He recounts there the belief of Plato and the Pythagoreans about the beings and their starting-points.

F55 *R27 Vita Aristotelis Marciana 146–151 (Gigon)*

Aristotle came indeed to have a very moderate character, since in the *Categories* he said that one should not give one's opinion rashly but review the issue many times, and that even to be merely puzzling through issues is not useless. And in *On the Good*, he says, "One should remember that one is a human, not only when lucky but also when demonstrating."

F56 *R28A Alexander of Aphrodisias, On Aristotle's* Metaphysics *56.33–35 (987^{b}33) (Golitsis)*

And for some such reasons Plato posited the one and the dyad as starting-points for the numbers and all the beings, as Aristotle says in *On the Good*.

F57 *R28B Alexander of Aphrodisias, On Aristotle's* Metaphysics *85.16–18 (990^{b}15) (Golitsis)*

The starting-points are the one and the indefinite dyad, as he has said a little while ago and he also recounted in the works *On the Good.*

F58 *R28C Simplicius, On Aristotle's* Physics *151.6–11 (187^{a}12–21)*

Alexander says that according to Plato the starting-points of all things and of the Forms themselves are the one and the indefinite dyad, which he calls the "great and small," as Aristotle also mentions in *On the Good*. One might also take this from Speusippus, Xenocrates, or others, who attended Plato's lecture on the good. For they all wrote down and preserved his opinion and they say that he used these starting-points.

F59 *R28D Simplicius, On Aristotle's* Physics *453.24–455.14 (202^{b}36)*

[Aristotle] says that the unlimited is in both the perceptibles and the Forms. For they say that, according to Plato, the one and the indefinite dyad are also starting-points of the perceptibles. Setting the indefinite dyad down also among the intelligible things, he said it was unlimited, and setting down the great and the small as starting-point, he said

it was unlimited in *On the Good*, at which Aristotle, Heraclides, Hestiaeus, and other companions of Plato were in attendance and wrote up what was said enigmatically, as it was said. . . . And Alexander himself, agreeing to speak on the basis of Plato's lectures *On the Good*, the lectures that Aristotle and Plato's other companions recounted, wrote the following: "For Plato, when inquiring into the starting-points of the beings, since it seemed to him that number was prior in nature to the others (for the limits of the line are points, and points are units with position, and there are neither planes nor solids without lines, but number can be even without them), therefore, since number is prior in nature to the others, he thought this was the starting-point and that the starting-points of the first number are also the starting-points of number as a whole. Two is the first number, whose starting-points he said are the one and the great and the small. For, insofar as it is two, it has plurality and fewness in itself. Insofar as the double is in it, plurality is in it (for the double is a plurality and excess and a sort of magnitude), but insofar as it is half, fewness. That is why excess and deficiency and great and small are in it in these ways. And insofar as each of its parts is a unit and it is some one form, the dyadic, it participates in the unit. That is why he said that the one and the great and small are the starting-points of two. And he said that this is the indefinite dyad, by having the more and the less, since it participates in the great and small or the greater and smaller. For, since these proceed in accord with tightening and loosening, they do not come to a stop, but go on toward the indefiniteness of the unlimited. Since, then, two is the first of the numbers, and its starting-points are the one and the great and small, these are necessarily also the starting-points of all numbers. And the numbers are the elements of all beings. Thus the starting-points of everything are the one and the great and small (that is, the indefinite dyad). For, each of the numbers, insofar as it is some this, and one, and definite, participates in the one, but insofar as it is divided and is a plurality, it participates in the indefinite dyad. Plato also says that the Forms are numbers, so he reasonably made the starting-points of numbers the starting-points of the Forms too. He said two is the nature of the unlimited, because neither the great and small nor the greater and smaller are defined, but contain the more and less, which proceed without limit." In this way, Aristotle saying into what things the Pythagoreans put the unlimited and into what things Plato put the unlimited, recounted next what the Pythagoreans said the unlimited was and why.

F60 *R29A Sextus Empiricus,* Against the Mathematicians *3.57*

At any rate, Aristotle . . . claims that what is said by [the geometers] to be "a length without breadth" is not unintelligible, but that we can conceive it without any difficulty. He supports his argument with a very clear and perspicuous example. At any rate, we grasp the length of a wall, he says, without also taking into account its breadth, which is precisely why it is also possible to conceive of what is called "length" by the geometers without any breadth.

F61 *R30 Alexander of Aphrodisias, On Aristotle's* Metaphysics *59.28–60.2 (988[a]11) (Golitsis)*

Although Plato speaks of the efficient cause where he says "it is our task, then, to discover and display the maker and father of the universe,"[16] and also the for-the-sake-of-which and the end by what he again says, "all things are in relation to the king of all things and all things are for his sake,"[17] one might ask why Aristotle does not mention either of these causes as being part of Plato's view. Either [it is] because in the places in which [Plato] spoke about causes, he mentioned neither of them (as [Aristotle] has shown in *On the Good*), or else because he did not posit them as causes of things that come to be and pass away, and did not even work out anything about them.

F62 *R31 Alexander of Aphrodisias, On Aristotle's* Metaphysics *250.17–20 (1003[b]31–33) (Golitsis)*

As regards the knowledge that pretty much all the contraries are reduced to the one and the many as to a starting-point, he refers us to the *Selection of Contraries*, since he treats these issues especially there. He also spoke about such a selection in the second book of *On the Good*.

1.3 *MAGICUS*

F63 *R32 Diogenes Laertius 2.45*

Aristotle says that a certain Magus who came from Syria to Athens made several judgments about Socrates, notably that his end would be violent.

F64 *R33 Suda, s.v. Antisthenes*

[Antisthenes:] An Athenian . . . he wrote ten volumes, the first one, *Magicus*. He relates things about Zoroaster, a certain Magus who discovered wisdom. Some attribute this to Aristotle, others to some Rhodian.

F65 *R35 Diogenes Laertius 1.1*

Some say that the work of philosophy started from the barbarians. For the Magi have come to be among the Persians, the Chaldeans among the Babylonians and Assyrians, the naked sophists among the Indians, and those called "druids" and "holy men" among the Celts and Gauls, as Aristotle says in the *Magicus*, Sotion in the twenty-third book of *Successions* [of Philosophical Schools], and also Ochos was a Phoenician, Zamolxis was Thracian, and Atlas was Libyan.

16. *Timaeus* 28c.
17. †*Letter* 2, 312e.

F66 *R36 Diogenes Laertius 1.8*

The Magi . . . do not know "magian" wizardry, Aristotle says in the *Magicus* and Deinon in the fifth of his *Histories*, who also says "Zoroaster" is translated "star-worshipper." Hermodoros also says this.

1.4 *EUDEMUS* OR *ON THE SOUL*

F67 *R37A Cicero,* On Divination *1.25.53*

What? Is Aristotle, a man of singular, almost divine genius, in error himself or does he wish others to err, when he writes the following? When Eudemus, his Cyprian friend, was making a journey to Macedonia he arrived at Pherae, which was at that time a very famous city in Thessaly, but was controlled by the tyrant Alexander as a merciless master. And then in that place, Eudemus became very seriously ill, so that all the doctors despaired. A young man with excellent visage appeared [in a dream] to him while he was resting to say that he would recover very soon, that in a few days the tyrant Alexander would perish, and that he, Eudemus, would return home five years later. Aristotle writes that indeed the first [two] immediately ensued: Eudemus recovered and the tyrant was killed by his wife's brothers. But when the fifth year was ending, although he had hoped on the basis of that dream to return to Cyprus from Sicily, he was killed while fighting at Syracuse. So the dream was interpreted as meaning that, since Eudemus' soul departed from his body, it was seen to return home.

F68 *R38 Themistius, On Aristotle's* De Anima *106.29–107.4 (430ª25)*

But pretty much the majority and weightiest of the arguments, which [Plato in the *Phaedo*] propounded about the immortality of the soul, perhaps referred to the understanding, . . . just like the arguments elaborated by Aristotle himself in the *Eudemus*.

F69 *R39 Elias, On Aristotle's* Categories *114.25–115.12*

When establishing the immortality of the soul, [Aristotle] establishes it in the acroamatic lectures through compelling arguments, but in the dialogs through plausible likelihoods. . . . In the dialogs he says in this way that the soul is immortal, because all of us humans spontaneously pour libations to the departed and swear oaths on them, but no one would ever either pour a libation to a non-existent thing or swear by it. . . . It is in the dialogs most of all that Aristotle seems to proclaim the immortality of the soul.

F70 *R40 Proclus, On Plato's* Timaeus *323.26–324.4*

And Aristotle, emulating Plato, in *De Anima* deals with the soul in a way appropriate to natural science mentioning neither the soul's descent nor its destinies. But in the dialogs, he dealt separately with these issues and set down the principal argument.

F71 *R41 Proclus, On Plato's* Republic *2.349.13–26*

Heaven-sent Aristotle also stated the cause due to which the soul, when it comes here from there, forgets the sights [it saw] there, but when it leaves this place here it remembers there the experiences [it had] here. And one must accept the argument: for he too says that some people going from health to sickness are susceptible to forgetting even the very letters they had learned, but no one going from sickness to health ever experiences this. He likened life without a body (since it is in accord with nature for souls) to health, and life in the body (since it is contrary to nature[18]) to sickness. For souls live there in accord with nature, while those down here live contrary to nature. So it makes perfect sense that it happens that, when souls come from there, they forget the things up there, but the ones going from here to there remember the things down here.

F72 *R42A Damascius, On Plato's* Phaedo *Versio 1, 530.4–6*

That it is necessary for a whole kind of human being to be nourished in this way[19] is clear from the case of the person who is nourished only on sunbeams, whom Aristotle recounts as having himself seen.

F73 *R42B Damascius, On Plato's* Phaedo *Versio 2, 138.1–2*

If, as Aristotle reports, there is a human here who does not sleep and feeds only on sunlike air, what must one suppose is the case for those there?

F74 *R43 Plutarch,* Quaestiones Conviviales *733C5–8*

Aristotle reports that the wet nurse of Timon in Sicily hibernated for two months every year and could be discerned to live only by her breathing.

F75 *R44 Pseudo-Plutarch,* Consolatio ad Apollonium *115B–E*

Not just nowadays, but long ago, as Crantor says, human affairs have been lamented by many wise men, who consider life to be retribution and its starting-point, the birth of a human being, to be the greatest misfortune. Aristotle says that Silenus declared this to Midas when he was captured. But it is better to quote the very words of the philosopher. He says the following, then, in the work titled *Eudemus* or *On the Soul*: "'That is why, greatest and most blessed one, in addition to considering the dead as being blessed and happy, we consider it impious to lie about them and blaspheme them, because they have now become better and greater people. These customs of ours are so old and so ancient that no one knows at all their starting-point in time nor who set them down first, but they have been continuously acknowledged for an unlimited period. And in addition to this, indeed, you see it in what is repeated through the mouths of humans over and over from ancient times.' 'What is that?' he asked. The other, said in reply, 'Therefore it is best of all not to be born, and being dead is better than living. And

18. Reading ὡς παρὰ φύσιν.
19. I.e., on food intermediate between heavenly food and ordinary food of this world.

many things sent from heaven testify to this.'[20] They say this happened to Midas, after the hunt where he captured Silenus, questioning him and asking what the best thing for humans is and what is the most choiceworthy of all things. At first he did not want to say anything but to keep his silence and not break it. But after a time, after using practically every contrivance, Midas led him to utter something to him, and, under compulsion, Silenus said: 'Short-lived seed of a suffering daimon and hard luck, why are you forcing me to say what is better for you not to know? For life with ignorance of one's own evils is least painful. But for human beings it is altogether impossible for the best thing of all to occur or to participate in the nature of what is best; for it is best for every man and woman not to have been born. However, the next best thing to this, and the first one practicable for a human being, is for those who have been born to die as quickly as possible.' He showed clearly in this way, then, how passing one's time in being dead is better than doing so in living."

F76 *R45A John Philoponus, On Aristotle's* De Anima *141.23–142.6, 144.22–25, 144.30–145.9 (407^{b}27)*

Aristotle, having criticized collectively everyone who has spoken about the soul for not having at all discussed the body that receives it, . . . appropriately connects this with a belief about the soul that follows from it. For some people, having looked to the same matter—namely, that it is not possible for a random body to partake of soul, but rather it needs a certain blend, just as a harmony too does not come about in random strings, but needs an arrangement of a certain sort—thought that the soul too was a harmony of the body and that the different forms of souls correspond to different harmonies of the body. He sets out this belief and refutes it. And till now, he only recounts this belief in this work,[21] but a little later he also sets forth the arguments through which people were led to this view. Already in other works (I mean the dialog *Eudemus* in particular) he has argued against the belief. And before him, Plato in the *Phaedo* used five arguments to object to this belief. . . . As I already said, Aristotle himself also made use of two of them in the *Eudemus*. The first was the following: for harmony, he said, there is something contrary to it, discord. But there is no contrary to the soul. Therefore, the soul is not a harmony. . . . The second argument is this: discord of the body is contrary to harmony of the body, but discord of an animate body is disease, weakness, and ugliness: disease is the lack of proportion in the elements, weakness is the lack of proportion in the uniform parts, ugliness is lack of proportion in the instrumental parts. Now if discord is disease, weakness, and ugliness, harmony would be health, strength, and beauty. But the soul is none of these. I mean that it is neither health nor strength nor beauty; for even Thersites had a soul despite being very ugly. Therefore, the soul is not a harmony. And he used these in those works, but he used

20. *EE* 1215^{b}20–22.
21. *De Anima*.

four destructive arguments against this belief here,[22] the third of which is the second one stated in the *Eudemus*.

F77 *R46 Simplicius, On Aristotle's* De Anima *221.28–33 (429^{a}10)*

And because of this, he [Aristotle] says in the *Eudemus* too, the dialog he wrote about the soul, that the soul turns out to be some sort of form, and in these works he praises those who say that the soul is receptive of the forms, not the whole soul, but the part with understanding, as the [whole soul] is capable of knowing the true forms [only] in a secondary way. For the true forms correspond to the understanding, which is greater than the soul.

F78 *R47A Pseudo-Plutarch,* De Musica *1139B*

Aristotle, Plato's student, says that harmony is something dignified, divine, and great in the following words: "Harmony is heavenly, having a divine, beautiful, heaven-sent nature; and by being naturally four-parted in capacity, it has two means, the arithmetical and the harmonic, and its parts, their magnitudes, and their relations appearing to have numerical and geometrical proportion. For songs are measured in two tetrachords." Having said these things, he composed its body from unequal parts, which nonetheless harmonized with each other and in fact its means harmonize in accord with arithmetical proportion. For the lowest note is fitted to the highest in a ratio of 2:1, composing the interval of the octave. . . . Aristotle showed, at any rate, that the capacities themselves have the following sorts of ratios: the lowest note exceeding the middle by a third part of itself, the highest exceeding the next above the middle in the same way. . . . Harmony, according to Aristotle, naturally exists in its parts and quantity in this way.

F79 *R48 Olympiodorus, On Plato's* Phaedo *9*

Proclus, however, wishes the heavenly bodies to have only sight and hearing, just like Aristotle. For they have only those perceptual modalities that contribute to the good, and not those that merely contribute to existence, while the other perceptual modalities contribute to existence. The poet testifies to this with the words "Helios, who watches and listens to all things,"[23] as if [the heavenly bodies] had only sight and hearing. And these perceptual modalities know by being active rather than by being passive and are more appropriate to the heavenly bodies as they are unchanging things.

1.5 *ON PRAYER*

F80 *R49 Simplicius, On Aristotle's* De Caelo *485.19–22 (292^{b}10)*

That Aristotle has conceived of something above both the understanding and substance is clear at the end of the book *On Prayer*, where he says perspicuously that the god is either understanding or something beyond the understanding.

22. *De Anima*.
23. Homer, *Iliad* 3.277.

1.6 *PROTREPTICUS*[24]

F81 *R50 Stobaeus,* Anthology *4.32.21*

Zeno said that Crates, when sitting in a shoemaker's workshop, read Aristotle's *Protrepticus*, which he wrote for Themison, king of Cypriots, saying that nobody possesses more goods for doing philosophy; for he has great wealth, so that he is able to spend money on this, as well as a good reputation. . . .

F82 *R51A Alexander of Aphrodisias, On Aristotle's* Topics *149.11-15 (110ª23)*

If someone were to say that one should not philosophize, then, since to philosophize is said to be to inquire into this very question of whether one should philosophize or not, as he [Aristotle] himself said in the *Protrepticus*, and also to pursue philosophical contemplation, when we show that each of these is proper to human beings, we refute the thesis on all sides.

F83 *R51B Elias, On Porphyry's* Isagoge *3.17–23*

Aristotle too . . . in the work entitled *Protrepticus*, in which he exhorts the youths to philosophy, . . . speaks in this way: if one must philosophize, one must philosophize and if one must not philosophize, one must philosophize; therefore, one must philosophize in every case. For if philosophy exists, we are obliged in all cases to philosophize. But if it does not exist, even in this case, we are obliged to inquire how it is [possible] for philosophy not to exist, but in inquiring we philosophize, since inquiring is the cause of philosophy. . . .

F84 *R52 Iamblichus,* On the General Science of Mathematics *79.1–81.7 (Festa)*

Some ancients and some moderns have arisen, who have expressed the contrary belief about mathematics, censuring it as completely useless and contributing nothing to human life. Some attack this thesis in the following way. If their end—that is, the reason for which philosophers say that one should learn them—is useless, then, much more radically, serious engagement with these things is necessarily vain. But about the end, all those who seem to speak most exactly about it pretty much agree. For some say that it is scientific knowledge of the things that are unjust and just, bad and good, being similar to geometry and other sciences of this sort, while others say that it is wisdom[25] about nature and that sort of truth, which those in the circle of Anaxagoras and Parmenides introduced. Indeed, someone investigating these things should not be unaware that all goods and all things that benefit the life of human beings lie in use and

24. D. Hutchinson and M. Johnson, "Authenticating Aristotle's *Protrepticus*," *Oxford Studies in Ancient Philosophy* 29 (2005): 193–294, plausibly argue that Iamblichus, our chief source for this work, does not substantially reorder or reword his own source for it, but excerpts it and inserts short bridge passages. No attempt has been made to separate one from the other.

25. *Phronêsis*, usually in particular "practical wisdom," generally has a less specific meaning in the *Protrepticus*, and is then translated as "wisdom."

action and not in knowing alone. For neither are we healthy by knowing what produces health but rather by bringing these to the body, nor do we become wealthy by knowing wealth, but rather by acquiring a lot of property. Nor do we live well—the greatest thing of all—by knowing some things that are, but rather by acting well; for this is truly to be happy.

So it is fitting that philosophy—if indeed it is beneficial—is either an action [generating] good things or useful for actions of this sort. However, it is clear to all that it itself is not a [productive] working of things—nor are any of the sciences previously mentioned. And that it is not useful for actions one could observe from the following. For we have the greatest example in the sciences similar to it and the underlying beliefs. For those things that the geometers are able to contemplate through demonstration, these same things we see them being unable of achieving through action. Rather land surveyors are able to divide parcels of land and all the other features of magnitudes and places because of their experience, while people dealing with mathematical objects and their accounts know how one should act, but are not able to act.

It is the same with music and the other sciences in which the knowledge-part and the experience-part are divided off from each other. For those determining the demonstrations and deductions, just like the philosophers, are used to investigate harmony and other such things, but do not take part in any of the works. But even if they happen to be able to somehow handle them, when they know the demonstrations as well as could be, they immediately do these very things worst, as if intentionally. On the other hand, those ignorant of the accounts, but trained and having correct beliefs, are completely and entirely superior when it comes to practical needs. And so too, when it comes to astronomical issues, for example, concerning the sun, moon, and other stars, those who have studied the causes and accounts know nothing useful for human beings. But those having what they call "navigational science" are able to foretell storms and winds for us. So sciences of this sort will be completely useless for actions; and if they leave behind correct actions, love of learning leaves behind the greatest goods. Contradicting them, we say that the mathematical sciences are also able to contribute. . . .

F85 *R53A Cicero,* Tusculan Disputations *3.28.69*

Thus Aristotle, when reproaching the ancient philosophers who supposed that philosophy had been completed due to their ingenuity, said they were either incredibly stupid or incredibly arrogant; all the same he added that he saw that, since in a few years a great addition has been made, in a short time philosophy would be absolutely complete.

F86 *R53B Iamblichus,* On the General Science of Mathematics *83.6–22 (Festa)*

Most recently, then, admittedly, exact speech about the truth is characteristic of pursuits. For after the destruction and the great flood, people were first forced to "philosophize" about matters concerning food and living, and when they were better resourced, they elaborated the crafts directed toward pleasure, such as music and the like, and when they went beyond the necessities they tried to philosophize in the

[proper] way. Nowadays those who have investigated geometry, speeches, and other sorts of education have advanced to such an extent, in the shortest time from the smallest beginnings, that no other kind of person has done in any craft knowledge. And in fact while everyone urges the other crafts on by honoring them in common and paying wages to those who possess those crafts, we not only do not exhort them to busy themselves with these [other] things, but often even prevent them; nonetheless, they devote themselves most of all to them anyway because they are most important in their nature. For what is posterior in coming to be is prior in substance and completeness.

F87 *R57 Oxyrrhynchus Papyrus 666*[26]

. . . prevents them from both [saying and] doing something they have deliberately chosen that they should do. That is why, observing the bad luck of these people, we should avoid such things and think that happiness consists not in obtaining many things but rather in how the soul is disposed. For even about a body, one would not say that the one decorated with splendid clothes is blessed, but the one that has health and is excellently disposed, even if it has none of the things mentioned. It is the same way with the soul too: if it is educated, it is the soul of this sort and a human being of this sort that are rightly called "happy," not one splendidly decorated on the outside but himself worthless. For neither would we think a horse worth anything, if it had a golden bridle and expensive equipment although it was bad; instead, we rather praise the one which is disposed in an excellent way. Apart from the things mentioned, when those who are not worth anything happen to be given abundant possessions and to get the goods that come through luck, then these possessions prove of more worth than they themselves; which is precisely the most shameful thing of all. For just as it would be ridiculous if someone were worse than his own household slaves, in the same way one must think that the people for whom their property happens to be of more worth than their own nature must be considered wretched. And it is this way in accord with the truth. For, as the proverb says, "Abundance begets wanton aggression, but lack of education together with power begets foolishness," since neither wealth nor strength nor beauty is among the good things for those whose souls are badly disposed. In fact, as these very dispositions are present more and more, to this same extent the possession brings more and greater harm to those who possess them, if they prove to be without wisdom. For "no knife for a child" is the same as "do not put power in the hands of bad people." All would agree that wisdom comes about as a result of learning and inquiring, the capacities of which are encompassed by philosophy. Thus, how would it be possible not to philosophize without hesitation.

26. Cf. R57 Stobaeus, *Anthology* 3.3.25.

F88 *R59 Boethius,* Consolation of Philosophy *3.8*

What if, as Aristotle says, human beings used the eyes of Lynceus, so that their vision penetrated obstacles; would it not then be the case that, if one looked into his internal organs, that outwardly beautiful body of Alcibiades would seem utterly disgusting?

F89 *R61B Cicero,* On Ends *2.13.40*

A human being, as Aristotle says, is born for two things, understanding and acting, as a sort of mortal god.

F90 **Iamblichus,* Protrepticus *5–12 (Pistelli 34.5–61.4)*[27]

5. |34| The following sort of approach leads to the same end. Every nature, |34.5| as if possessing reason, does nothing randomly, but rather does everything for the sake of something. Indeed, banishing randomness, it gives more heed to the for-the-sake-of-which than even the crafts, because it is nature that the crafts are imitations of. Since the human being is by nature composed of soul and body, and |34.10| the soul is superior to the body and the inferior serves for the sake of the superior, the body too is for the sake of the soul. Of the soul, one part has reason and the other does not, the latter being inferior too, so that the non-rational part is for the sake of the part having reason. Within the part having reason is the understanding. So |34.15| the demonstration necessitates that all things be for the sake of the understanding.

Of the understanding, the acts of understanding are activities, since they are acts of seeing intelligible objects, just as the activity of the organ of sight is seeing the visible objects. Indeed, all things choiceworthy for human beings are for the sake of the act of understanding and the understanding, if indeed the other parts are choiceworthy for the sake of the soul, |34.20| and the understanding alone is the best part of the parts in the soul, and the others are composed for the sake of the best.

Again, among thoughts, the free ones are all those that are choiceworthy because of themselves, while those that bring about knowledge because of other things are like slaves. And in all cases what is [pursued] because of itself is better than what is [pursued] |34.25| because of something else, since the free is better than what is not free.

Indeed, when actions use thought, even if it is the understanding **|35.1|** that suggests what is beneficial and guides thought, nonetheless it follows along with these actions, and so also needs a body that serves it and, indeed, is infected with luck too, on behalf of those things our actions aim at—actions over which the understanding has control, though the majority of them come about through the body.

So, among thoughts, those that are choiceworthy because |35.5| of bare contemplation are more estimable and better than those useful for other things. Acts of contemplation are estimable because of themselves, and within these, theoretical wisdom of the understanding is choiceworthy, while thoughts in accord with practical wisdom

27. Portions of this passage are included in R52B, R55, R58B, R59A, R60A, R61.

are choiceworthy because of [other] actions. So the good and estimable is found within those acts of contemplation that are in accord with theoretical wisdom, but not |35.10| in any random act of contemplation. For not every apprehension is unconditionally estimable, but the apprehension of the ruling part when it is wise and is of the starting-point of the universe. This may be set down as associated with and appropriate to theoretical wisdom.

A human being deprived of perception and understanding comes to be much the same as a plant, |35.15| but when deprived only of understanding is made beast-like. But if deprived of the non-rational part while remaining within the reach of understanding, he becomes like a god. One must, then, cancel the non-rational feelings to the extent that they are [merely] potential, while using the pure activities of the understanding that look off toward oneself and the divine, and |35.20| must take care to live by the orbits of the understanding, making one's attending eye and love allies with it. For one must not contemplate what has to do with the god and divine things for the sake of actions. For they say it is not lawful to stain the sight of the divine by enslaving it |35.25| to the necessity of human utility. And, in general, one must not welcome understanding because of its uses. . . . Perhaps with a view to these things, [understanding] alone among all **|36.1|** the various capacities that we possess hits the mark, and, from the opposite side, one must order together actions and everything else with a view to understanding and the god, and it is from this that one must also measure the reasonableness of one's particular duties. For judgment that is just and in accord with worth is also alone of all things sufficient |36.5| to equip human beings with true happiness. For the way in which we differ from the other animals only shines through in this sort of life, in which nothing random or without great worth can happen. For while there are some small glimmers of reason and practical wisdom in the other animals, they are entirely bereft of theoretical wisdom, |36.10| which is shared only with gods. As the human being lacks the exactness and strength of the other animals in perception and impulse, and as only that really good thing[28] cannot be subtracted, which they agree is encompassed by the notion of the good, in no way |36.15| would the excellent person who lives in accord with this way of life subject himself to the changes of luck, but free himself—and do so more than anyone else—from those things that are in the grip of luck. That is also why, to have wholehearted confidence is possible for those who remain in this way of life. For who will subtract anything from the person |36.20| who has already alienated himself from everything that can be subtracted, holding on to his true self, living in what is his, and feeding on what is his and on the good life of the immeasurable god with whom he has contact? Let such things suffice as a Pythagorean |36.25| summoning to complete theoretical wisdom.

6. Since we are addressing people, but not those who do have the divine dispensation of life readily accessible, it is necessary **|37.1|** to mix into such addresses exhortations to

28. The life of understanding.

the political and practical life. Let us, then, say the following. The things that are support for our life, such as the body and the things having to do with the body, support it like instruments. But their use is dangerous, and |37.5| the second ones do more harm [than good] to those who do not use them properly. So one should desire to acquire scientific knowledge and use it fittingly. Through this knowledge we will set up all these things well. Therefore, we must philosophize if we are to engage in politics correctly and lead our own lives in a |37.10| beneficial way.

Further, while some sciences produce each of the things that are advantageous in life, others use them, and the ones that are servicing are different from those that command, and what is strictly speaking good lies in the latter ones as if they were more authoritative. |37.15| Therefore, if only the science that has correctness of judgment and uses argument and contemplates the good as a whole—that is, philosophy—is able to use everything and order it in accord with nature, one must philosophize in every way, since philosophy alone contains in itself correct judgment and |37.20| unerring prescriptive wisdom.

Further, since we all choose what is possible and beneficial, one must demonstrate[29] that both of these belong to philosophy, and that the difficulty of acquiring it is outweighed by the magnitude of the benefit; |37.25| for we all labor with greater pleasure on what is easier. That we are able, then, to obtain scientific knowledge about what is **|38.1|** just and advantageous, and further about nature and the rest of truth, one can easily show. For what is prior is always more knowable than what is posterior, and what is better by nature is more knowable than what is worse. For scientific knowledge is of the definite and ordered |38.5| more than of their opposites, and of causes more than of results. And good things are more definite and ordered than bad things, just as a decent human being is more so than a base human being; for these necessarily exhibit the same difference with respect to each other. And prior things are causes |38.10| more than posterior things. For when the prior things are done away with, the things that get their substance from these are also done away with: lengths when numbers are, planes when lengths, solids when planes, and letters when so-called syllables are. So if indeed the soul is better than the body (for it is by nature more ruling) |38.15| and medicine and physical education are [sorts of] craft knowledge and wisdom concerning the body (for we set these down as sciences and claim that some people have acquired them), it is clear that there is some sort of care and craft knowledge concerning the soul and the virtues of the soul and we are able to grasp it, even if |38.20| it is one we are more ignorant about and is harder to know.

It is the same way with matters concerning nature too. For wisdom about the causes and elements **|39.1|** must be much more prior to knowledge of what is posterior. For these are not among the most extreme things, nor do the first things come to be from them by nature, but the other things clearly come to be and are constituted from and through the first ones. For whether fire, air, number, or some other natures are

29. Reading ἀποδεικτέον.

causes—first causes—of the other things, |39.5| it is impossible to know about any of the things while ignorant of these natures. For how could one know language while ignorant of syllables, or have scientific knowledge of these without knowing the letters at all?

Let these things be said, then, about the fact that there is scientific knowledge of the truth and the virtue having to do with the soul, and why we are able to get them. |39.10| And it is clear from the following considerations that this knowledge is the greatest good and the most beneficial of them all. For we all agree that the most excellent and naturally strongest must rule and that the law alone must rule and be in control. And this |39.15| is some sort of wisdom and account stemming from wisdom.

And further, who is a standard for us, who is a more exact defining mark of the goods than the wise person? For whatever things he would choose by choosing in accord with scientific knowledge, these things are good, and their contraries bad. And since everyone chooses |39.20| most of all what is in accord with his own state (for the just person chooses to live justly, the one who has courage to live in accord with courage, and likewise the temperate one chooses to be temperate), it is clear that the wise person will choose most of all to be wise; for that is the work of this capacity. So it is evident that, |39.25| in accord with the judgement with the most control, **|40.1|** wisdom is the greatest of all goods. Then one should not flee philosophy, if indeed philosophy is, as we think, the acquisition and use of theoretical wisdom, and theoretical wisdom is among the greatest goods. And one should not sail to the pillars of Heracles and frequently get into danger for the sake of money, while not doing anything hard and not spending anything for |40.5| wisdom. It would surely be slavish to strive to live rather than striving to live well, to follow himself the beliefs of ordinary people rather than expecting ordinary people to follow one's own beliefs, to seek money but take no care |40.10| at all of what is nobly beautiful.

As regards the benefit [of philosophy] and its greatness, then, I think this has been sufficiently demonstrated. As to why acquiring it is much easier than other goods, one may be persuaded of this from the following. For it seems to me a sign of how easy philosophy is that though there is no reward from people |40.15| for those who philosophize, because of which they would eagerly labor so hard, and that, having given themselves freely to the other crafts, yet in a short time they make more progress[30] in the exact ones.[31] And further everyone's |40.20| being fond of it and wishing to pass their leisure avoiding everything else is no small proof that close attention to it is accompanied by pleasure; for no one wants to labor for a long time. In addition, the use [of philosophy] differs greatly from [that of] all others. For philosophers do not need |40.25| instruments or special locations for their work, but wherever exactly in the inhabited world you settle **|41.1|** your thought down, you touch the truth in the same way from everywhere, as if it were present.

30. Reading προληλυθέναι.
31. I.e., the various branches of philosophy.

So it has been demonstrated that philosophy is possible and why it is the greatest good and easy to acquire, so that it is worth comprehending it eagerly for the sake of all these things. |41.5|

7. One might see the same thing in more familiar terms from the following. Being wise and knowing are intrinsically choiceworthy for all human beings (for it is not possible for them to live as human beings without these) and are also useful for life. For nothing good comes to us that is not brought to completion with |41.10| rational calculations and the operations of wisdom. Moreover, whether living happily consists in enjoyment or in possessing virtue, or in wisdom, in every case one must philosophize; for these come to us most purely through philosophizing.

Further, |41.15| in us there is soul and body, the former ruling and the latter being ruled, the former using and the latter being subordinate as an instrument. In fact, the employment of the ruled and the instrument is always arranged with a view to the ruler and user. One part of the soul is reason, which is precisely what |41.20| naturally rules and judges what concerns us, and another part follows and is naturally ruled. Everything is well-disposed in accord with its own virtue; for what has obtained this [virtue] is good. Also, whenever the greatest, most controlling, and most choiceworthy things have their virtue, then they are well-disposed; |41.25| therefore, the virtue in accord with nature of what is better is better by nature. And what is more of a ruler by nature and more of a leader is better, as human beings stand in relation to the other animals. The soul, then, is better than the body (for it is more of a ruler), and of [parts of] the soul the one having reason and thought is better; for it is |41.30| such as to command and forbid, to say what should and should not **|42.1|** be done in action. And whatever the virtue of this part is must be unconditionally the most choiceworthy of all things, both for everyone generally and for ourselves; for one may set this part of us down, I think, either as what we are exclusively or else what we are most of all.

Further, whenever what is said to be the natural work of each thing |42.5| is completed most nobly, not coincidentally but intrinsically, this must be said to be good and set down as the most controlling virtue, the one in accord with which each thing can naturally accomplish this [work]. The activities of what is composite and divisible are many and different, |42.10| but what is by nature simple and whose substance is not in relation to something [else], it necessarily has a single intrinsic virtue, strictly speaking. If, then, a human being is some simple animal whose substance is ordered in accord with reason and understanding, its work is nothing other than the most exact truth, |42.15| that is, arriving at the truth about the beings. But if it is naturally composed of several capacities, it is clear that, of the several things it can naturally accomplish, the best of them is always its work—for example, of the doctor it is health and of the captain safety. And we cannot say that there is any better work |42.20| of thought or of the thinking part of our soul other than truth. Truth, therefore, is the most controlling work of this part of the soul.

It does this in virtue of unconditional scientific knowledge and to a higher degree in virtue of what is scientific knowledge to a higher degree, and in this way contemplation is the most controlling end. For whenever |42.25| one of two things is choiceworthy because of the other, the one because of which the other is choiceworthy too is even better and more choiceworthy—for example, pleasure is better and more choiceworthy than pleasant things, health than healthy things; for the latter are said to be productive of the former. **|43.1|** Nothing, then, is better and more choiceworthy than wisdom, which we claim is a capacity of the most controlling part in us, to judge one state in comparison to another. For the knowing part, both separately and conjoined with the rest of the soul, is better than the entire [rest of the] soul, and scientific knowledge is its virtue.

Therefore, |43.5| the work of wisdom is not any of the so-called particular virtues.[32] For it is better than all of them, and the end produced is always greater than the scientific knowledge that produces it. Nor is every virtue of the soul in this way its work, nor is happiness. For if it were productive, it would be productive of something distinct, |43.10| as house-building is productive of a house, but is not a part of the house. However, wisdom is a part of virtue and of happiness; for we say that happiness either comes from wisdom or is wisdom itself. According to this argument too, then, it is impossible for this scientific knowledge to be productive. |43.15| For the end must be better than what comes to be, but nothing is better than wisdom, unless it is one of the things just mentioned, but the work of these things is nothing other than it. Therefore, one must say that this scientific knowledge is a sort of contemplative science, since the end cannot be production. Therefore, exercising wisdom |43.20| and contemplating is the work of virtue and the most choiceworthy of all things for human beings, just as, I think, seeing too is for the eyes, and one would even choose to see, even if nothing distinct was going to come about because of it besides the sight itself.

Further, if we are fond of seeing |43.25| for its own sake, this testifies sufficiently that everyone is fond of exercising wisdom and knowing to the utmost degree. Further, if someone is fond of something because something else has followed upon it, it is clear that this person will wish more what brings it about more. **|44.1|** For example, if someone happens to choose to walk because it is healthy, and it occurs to him that running is healthier, and it is possible, he will choose it even more, as soon as he knows this. Further, if true belief is similar to wisdom, if indeed believing truly is choiceworthy |44.5| in that and insofar as it is similar to wisdom because of its truth, and if this belongs more to exercising wisdom, then exercising wisdom will be more choiceworthy than believing truly.

But surely living is distinguished from non-living by perceiving, |44.10| and living is defined by the presence and capacity of perception, and if this is taken away, life would not be worth living, as if life itself were done away with because of perception's being done away with. The modality of sight differs from other perceptual modalities by its

32. Courage, temperance, and so on.

being the most exact, and this is most of all why we choose it. But every perceptual modality |44.15| is a capacity for knowing through the body, as, for example, hearing perceives sound through the ears. If, then, living is choiceworthy because of perception, and perception is a sort of knowledge, and we choose the soul because the soul is able to know things with it, and earlier we said that |44.20| of two things, the more choiceworthy one is always the one to which the same thing belongs to a greater extent, and sight is necessarily the most choiceworthy and estimable of the perceptual modalities, it follows that the wisdom that knows the truth in the most controlling way is more choiceworthy than sight, all the other perceptual modalities, and living. So all human beings |44.25| [must] pursue exercising wisdom most of all. For those fond of living are fond of exercising wisdom and knowing, for they honor it for nothing other than because of perception and most of all **|45.1|** because of sight. For they evidently love this capacity excessively, for, compared to the other perceptual modalities, it is literally some sort of scientific knowledge.

8. It would also not be a bad idea to recall what was put forward based on common conceptions, that is, what is clearly |45.5| apparent to all. Indeed, it is completely obvious to all that no one would choose to live with the greatest wealth and power of all humankind, while at the same time having his exercise of wisdom gotten rid of and being mad, nor if he were to live while enjoying the most intense pleasures, as some deranged people |45.10| live their lives. Everyone, then, it seems, avoids ignorance most of all. And wisdom is the contrary of ignorance, and for any pair of contraries, when one of the pair is to be avoided the other is to be chosen. So, as being ill is to be avoided, in this way being healthy is choiceworthy for us. Then according to this argument too, wisdom, it seems, |45.15| appears to be the most choiceworthy of all things, not due to something else following upon it, just as the common conceptions testify. For even if one were to have everything, but were destroyed and ill as regards exercising wisdom, this life would not be choiceworthy; for one would not benefit from the other goods either. |45.20| So everyone, to the extent that they perceive the exercise of wisdom and are able to taste this thing, think nothing of the other things, and due to this cause none of us would stand to be drunk or a child for his entire life. Because of this, then, although sleeping **|46.1|** is most pleasant, it is not choiceworthy, even if we suppose that all pleasures are present to the person sleeping because while the appearances when asleep are false, when awake they are true. For sleeping and waking do not differ in any way except that the soul often |46.5| arrives at the truth when awake but is always deceived when asleep; for every appearance during sleep is an image and is false.

The soul's love of learning is also proved by how many people avoid death. For one avoids what one does not know, what is shadowy and unclear, |46.10| while one by nature pursues what is clear and known. That is also why we say that it is those who have been the cause of our seeing the sun and the light that we should most of all honor and respect, namely, our father and mother, as the causes of the greatest goods. And they are, it seems, the causes of our wisely knowing and seeing anything. Because of

the |46.15| same thing, we enjoy both people and things that we are used to, and we call those people "dear" whom we know. So these things perspicuously show that the known, the exact, and the evident are prized. If this is so for the known and the exact, it is clear that |46.20| it must also be so for knowledge and exercising wisdom.

In addition, just as in the case of wealth its possession for the sake of living and for the sake of living happily are not the same for human beings, so too in the case of wisdom I do not think we need the same for merely living |46.25| as for living nobly. And though many people may be much excused for doing this (for they pray to be happy but are satisfied even if they are merely able to live), for whoever thinks that **|47.1|** he must not put up with life on any terms, it would be ridiculous not to put up with every labor, and not to make every effort, to acquire the wisdom that knows truth.

One might also realize the same thing from the following, that is, if one |47.5| considers human life in the clear light of day. For one will discover that the things considered great by human beings are all [merely] shadow painting. Hence it is also said correctly that the human being is nothing and that there is nothing stable in human affairs. For strength, greatness, and beauty |47.10| are ridiculous and not worth anything, and beauty seems to be beauty because nothing is seen with exactness. For if someone were able to see sharply, as they say Lynceus was, who was able to see through walls and trees, how on earth could he think such vision to be tolerable, if he saw what bad things [a human being] was composed of? |47.15| And honor and reputation, which are admired more than the rest, are full of indescribable foolery; for to one observing something eternal, it would be silly to be serious about these things. What is great or long-lasting among human things? But on account of our weakness, I think, and life's brevity, |47.20| it seems to be of much value. Which of us, then, when considering these things, would think himself happy and blessed, who have, in the first place, been composed from the outset by nature as if we were all destined for punishment, as the initiates into the mysteries[33] say? For the most ancient ones say this in a divinely inspired way, saying that the **|48.1|** soul "pays penalties" and that we live in retribution for some great errors. For the yoking of the soul to the body seems very much to be due to something of this sort. For just as they say that the Tyrrhenians often torture captives by binding corpses right onto their living bodies, |48.5| so that they are facing each other, fitting each body part to each part of the corpse, in the same way the soul seems to be stretched out and glued onto each of the body's perceptual organs.

Nothing divine or blessed belongs to humans, then, except maybe the only thing worth taking seriously, namely, |48.10| however much understanding and reason there is in us; for this seems to be something of ours that alone is immortal and alone is divine. Besides, by being able to share in a capacity of this sort, even if life is by nature wretched and hard, nonetheless it is administered so gracefully that |48.15| a human

33. Mystery cults in ancient Greek religion initiated new members by revealing secret doctrines and rituals. The sort of view described in what follows is consistent with our evidence about Orphic religion.

being seems to be a god in comparison with the other beings. "For the understanding is the god in us" (either Hermotimus or Anaxagoras said this) and "the mortal period of existence has a portion of a god."

So either one must philosophize or one must say "farewell" to life, since everything else, at any rate, seems to be a lot of foolery |48.20| and trash. In this way, one might rightly summarize the approaches from common conceptions exhorting one to philosophize theoretically and live, as much as possible, the life that is in accord with scientific knowledge and understanding.

9. |49.1| Starting from an earlier point, from the wish of nature, we will proceed to the same exhortation in this way. Some things that come to be come to be from a certain sort of thought and craft—for example, a house and a ship (for a certain craft and thought is the cause of both of these), while other things |49.5| do not come about due to any craft at all, but due to nature. For nature is the cause of animals and plants, and all such things come to be in accord with nature. Nonetheless, some things also come to be due to luck. Indeed, we say that most of the things that do not come to be due to craft, nature, or necessity come to be due to luck. |49.10|

Of the things that come to be from luck, none comes to be for the sake of something, nor does any have an end. But the things that come to be from craft have the end and the for-the-sake-of-which present in them (for the person possessing the craft will always give you an account of why he prescribed [what he did], that is, for the sake of what), and |49.15| this [end] is better than what comes to be due to the end. I mean all the things of which craft is by nature intrinsically, not coincidentally, a cause. For strictly speaking we would set down medicine to be a cause of health rather than of disease and house-building to be a cause of a house rather than of its demolition. Therefore, everything that is in accord with craft comes to be for the sake of something |49.20| and this something is its best end, while what is due to luck does not come to be for the sake of something. For something good might also come about from luck, but nonetheless it is not good by being in accord with luck and insofar as it is due to luck; rather, what comes to be in accord with luck is always indeterminate. |49.25|

But what is in accord with nature does come to be for the sake of something and is always constituted for the sake of something better than what is due to craft. For it is not nature that imitates craft, but **|50.1|** craft that imitates nature, and craft is for assisting and filling up the omissions of nature. For nature itself seems to be capable of accomplishing some things by itself and to require no assistance, but others it is scarcely able or indeed completely unable to accomplish—for example, to begin with, even as regards generation. Though some |50.5| seeds perhaps grow without protection in whatever sort of ground they fall upon, others require the craft of agriculture in addition. In much the same way, some animals too achieve their full nature by themselves, but the human being needs many crafts for its safeguarding, |50.10| both at the time of the initial generation and then the later nourishment.

Further, if craft imitates nature, it follows from this that everything that comes to be by means of the crafts comes to be for the sake of something. For we would set it down that everything that comes to be correctly comes to be for the sake of something. And |50.15| surely what comes to be in a nobly beautiful way comes to be correctly. And everything that comes to be or has come to be, at any rate, in accord with nature, comes to be, or has come to be, in a nobly beautiful way, if indeed what is contrary to nature is base, and what is coming to be in accord with nature comes to be for the sake of something.[34]

And one might see this also from each of our parts—for example, if |50.20| you were to look at the eyelid, you would see that it is not pointless but came to be for the sake of helping the eyes, so that it gives them a rest and prevents objects from falling into the eye. But that for the sake of which something *came* to be is the same as that for the sake of which it *should* come to be—for example, if a ship *should* have come to be for the sake of |50.25| conveyance by sea, that is also why it came to be. But animals are among the things that come to be by nature,[35] **|51.1|** either all of them or, at any rate, the best and most estimable. For it makes no difference if one thinks that many of them have come to be against nature, on account of some sort of deterioration or bad condition. But surely the human being is the most estimable of the animals here [in the sublunary world], so it is clear that it has come to be by nature |51.5| and in accord with nature.

Among the beings, this is nature and the god begot us for the sake of this. When asked what it is, Pythagoras said "to contemplate the heavens," and he used to say that he himself was a contemplator of nature and passed his life for the sake of this. |51.10| They say that Anaxagoras too,[36] when asked what one might choose to come to be and live for, answered the question by saying "for the sake of contemplating the things in the heaven and the stars around it, and also the moon and the sun," as though all the others, at any rate, are worth nothing. |51.15|

Further, if the end of each thing is always better [that the thing itself] (for everything which comes to be comes to be for the sake of the end, and the that-for-the-sake-of-which is better, indeed the best, of all things), and the end in accord with nature is what is naturally completed last in the process of coming to be, if the process of coming to be reaches its limit continuously, |51.20| then, while the parts of the human body reach their end first, the parts pertaining to soul do so later, and in a certain way the end of the better thing always is posterior in the process of coming to be. Thus the soul is posterior to the body and wisdom is last among the things in the soul. For we see this coming to be by nature last in human beings. That is also why old age **|52.1|** lays claim to this alone among the goods. Therefore, some sort of wisdom is by nature our end, and exercising wisdom is the last thing for the sake of which we have come to be. If we have come to be, then, it is clear that we also exist for the sake of exercising wisdom and learning.

34. Reading καὶ ἡ κατὰ φύσιν γένεσις.
35. Rejecting the addition of τε καὶ κατὰ φύσιν.
36. *EE* 1216^{a}11–14.

|52.5| Therefore, according to this argument, at any rate, Pythagoras was correct to say that every human was constructed by the god for knowing and contemplating.

But whether the cosmos or some other nature is the object of this knowledge, we must perhaps inquire about later; for now, though, what we have said is enough |52.10| for us as a first step. For if wisdom is the end in accord with nature, exercising wisdom would be the best of all things. So one should do the rest for the sake of the goods which come to be in oneself, and, of these, one should bring about the ones in the body for the sake of those in the soul, and bring about virtue for the sake of wisdom. |52.15| For this is the highest thing of all.

To search in the case of each science for something distinct to come about, that is, to require that it be useful, is characteristic of someone completely ignorant about the extent to which good things and necessary things are at variance from the start; for they differ the most. For we like the latter because of something else, |52.20| since without them life would be impossible, and they must be called "necessities" and "co-causes," while the former, which we like because of themselves, even if nothing else were to follow as a result, must be called "goods" in the strict sense. For this is not choiceworthy because of that, and that because of something else, nor does this vanish by going on without limit, but instead stops somewhere. It is completely ridiculous, then, |52.25| to seek some other benefit from everything besides the thing itself, and to ask "what is of benefit for us?" and "how is it useful?" For truly, just as we say, such a person seems nothing like the one who knows the noble and good or distinguishes what **|53.1|** the cause is and what the co-cause.

One would see that what we say is all the more true, if someone were to transport us in thought to, for example, the Isles of the Blessed.[37] For in that place there would be no need of anything nor any benefit from anything else; |53.5| only thinking and contemplating would remain, which we say now too is a free life. If this is true, how could one of us fail to be rightly ashamed, who, although having the freedom to live on the Isles of the Blessed, was unable to do so because of himself? So |53.10| the reward of scientific knowledge for human beings is not to be found fault with, nor does it bring about a trivial good. For just as the wise poets say that it is in Hades that we receive the gifts of justice, in the same way it is in the Isles of the Blessed that we receive the gifts of wisdom; so it seems.

So it is no terrible thing if |53.15| it does not appear useful or beneficial; for we say that it is not beneficial but good in itself, nor is it appropriate to choose it because of something else but rather for itself. For just as we travel to Olympia for the sake of the spectacle, even if nothing more were to come from it |53.20| (for seeing is itself better than many possessions), and we are spectators at the Dionysian festival not as if we were getting some money from the actors, but actually handing some over, and there are many other spectacles that we would choose in place of many possessions, in this way too contemplation of the universe |53.25| is to be honored before everything

37. Cf. Cicero, *On Ends* 5.53.

considered useful. **|54.1|** For surely people should not travel with great effort for the sake of being spectators of people imitating women and slaves or people fighting and running but think that one should not contemplate the nature of things and the truth without payment. In this way, then, by |54.5| proceeding from the wish of nature, we made an exhortation to exercising wisdom as good and estimable because of itself, even if nothing useful for human life were to come from it.

10. Moreover, |54.10| one can easily discover, by considering the crafts, that contemplative wisdom brings about the greatest benefit for human affairs. For just as sophisticated doctors and the majority of physical trainers agree that if one is going to be a good doctor or physical trainer, |54.15| one must be experienced about nature,[38] so too good legislators should be experienced about nature—indeed, much more so than those others. For while the latter are craftsmen only of the virtue of the body, the former, since they are craftsmen of the virtues of the soul, and profess to teach about the happiness |54.20| and unhappiness of a city, much more need philosophy in addition. For just as in the other workmanlike crafts, the best instruments are discovered from nature (for example, in building, a carpenter's line, standard ruler, and compass),[39] since some are grasped by means of water, or by means of light |54.25| and beams of sunlight, and it is by judging in relation to these that we examine what, in accord with perception, is sufficiently straight or smooth, in the same way the politician must possess certain defining marks, **|55.1|** derived from nature itself and from the truth, in relation to which he judges what is just, what is noble, and what is advantageous. For just as there[40] these instruments are superior to all others, so too the law laid down most in accordance with nature is the noblest. And this cannot possibly be done without having philosophized |55.5| and known the truth.

In the other crafts they pretty much know that they do not get their instruments and their most exact rational calculations from the primary starting-points themselves, but from secondary, |55.10| tertiary, or more remote ones, and their accounts from experience; but imitation of the most exact things is possible for the philosopher alone of all of them, for he is a spectator of these very things, not of imitations. Just as, then, no one is a good builder who does not use a standard ruler |55.15| or any other instruments of this sort but simply matches them to other buildings, in the same way, probably, if someone legislates in a city or does actions looking at and imitating other human actions and constitutions, such as the Spartan, Cretan, or whatever, |55.20| he will be neither a good legislator nor an excellent one. For it is impossible for an imitation of what is not noble to be noble, nor can an imitation of what is not divine and stable be by nature immortal and stable. Rather, the laws of the philosopher alone among the craftsmen are stable and the actions correct and noble. |55.25| For he alone

38. *Sens.* 436^{a}17–^{b}1, *Juv.* 480^{b}26–28.
39. There may be a lacuna in the text at this point.
40. I.e., in the workmanlike crafts.

lives looking toward nature and the divine, and just like a good captain, **|56.1|** having moored the starting-points of his life to what is eternal and stable, lies at anchor, and lives in accord with himself.

Though this scientific knowledge is contemplative, it enables us to craft everything in accord with it. For just as sight is not productive or a crafter of anything (for its only work is to discern |56.5| and make clear each visible thing), but enables us to do something because of it and helps us most of all with our actions (for we would be pretty much unable to move at all were we deprived of it), so it is clear that, though the scientific knowledge |56.10| is contemplative, we nonetheless do countless things in accord with it, getting some things, avoiding others, and, in general, we acquire everything good because of it.

11. It will become clear from the following that the most pleasant life belongs to those who choose the life that is in accord with understanding. It appears that living is said in two ways, one in accord |56.15| with capacity, the other with activity. For we say that those animals are "seeing" that have sight and are naturally capable of seeing even if they happen to have their eyes closed, and also those that are using this capacity and casting their eye on things. It is the same way with scientific knowing and knowing: in one case we mean to use them and contemplate, |56.20| in the other, to have acquired the capacity and to possess the scientific knowledge. Therefore, if we distinguish living from non-living by means of perceiving, and perceiving is said in two ways, in the strict sense, using the perceptual capacities, and in another sense being capable of doing so (that is why, it seems, we say that someone "perceives" even though **|57.1|** he is asleep), it is clear that "living" follows it and is said in two ways: the one who is awake must be said truly and strictly to "live," but the one who is asleep must be said to "live," because of being capable of changing into this movement, because of which we say that someone is both awake and |57.5| perceiving something.

Because of this and looking to this, whenever the same thing is said of each of two things, but one of them is said to be "affecting" and the other to be "being affected," we will assign the thing said as belonging more to the former—for example, "knowing scientifically" belongs more to the one using than to |57.10| the one having scientific knowledge, and "seeing" belongs more to the one who casts his eye on things than one capable of doing so. For we do not say "more" only in accord with excess in things of which there is a single account, but also in accord with what is prior and posterior—for example, we say health is "more good" than healthy things, |57.15| and what is intrinsically choiceworthy in accord with nature [is more good] than what is productive of it. And yet we see, at any rate, that the account, insofar as it is predicated of both, is not [strictly] the same regarding what is good in the case of beneficial things and what is good in the case of virtue. Therefore, the person who is awake must be said to live "more" than the person who is asleep, and the person who is active |57.20| by his soul "more" than the one who merely has a soul; for it is because of the former person that we say the latter is living, because the latter sort of person is able to be affected or to affect like the former.

Then, in the case of all things, using them is surely this: whenever the capacity is for one thing, someone who does this very thing uses it, but if it is a capacity for a larger number of things, whichever of these is the best |57.25| —for example, with pipes, one uses it either only or most of all when one plays it; for presumably this is so in the other cases too.[41] **|58.1|** One must also say, then, that the one who uses something correctly is using it in the most strict sense; for the end and the natural way [of using something] belong to the one who uses it correctly and exactly. Of the soul too, then, thinking and rationally calculating is the only work, or most of all the work. Therefore, it is now simple and easy for everyone to deduce |58.5| that the person who is thinking correctly lives in the most strict sense, and that the one who has the most truth lives the most of all, and this is the one who is exercising wisdom and contemplating in accord with the most exact scientific knowledge; complete living should then also be attributed to those who are exercising wisdom and are wise. But if |58.10| living is the same thing for each animal as its existence, it is clear that the wise person would of all living things be both most of all and in the strictest sense living, and most of all so during the time when he is active and happens to be contemplating the most knowable of the beings. But complete and unhindered activity |58.15| contains enjoyment in itself, so that contemplative activity is the most pleasant of all activities.

Further, being pleased while drinking is distinct from drinking pleasurably; for nothing prevents someone who is not thirsty, or who has not been offered the drink he enjoys, from being pleased while drinking, not because of the drinking but because it occurs |58.20| at the same time as he is sitting looking at something or being looked at. Thus, we would say that this person is pleased, and is drinking while he is pleased, but not because of drinking and not because of drinking pleasurably. In this way, then, we say that walking, sitting, learning, and every movement are pleasant or painful, not insofar as we happen to be pained |58.25| or pleased while they are present, but rather insofar as we are all pleased or pained by their presence. And in the same way we say that life is pleasant if its presence is pleasant to those who have it, **|59.1|** and that not everyone lives pleasantly who happens to enjoy himself while living, but rather those for whom living itself is pleasant and who enjoy the pleasure that comes from living.

We attribute living, then, to the person who is awake more than to the one who is sleeping, to the one who is exercising wisdom more than to the one lacking wisdom, and we say that the pleasure that comes from living is the one that |59.5| comes to be from the use of the soul; for this is true living. Now, even if there are many uses of the soul, in the strictest sense of all, at any rate, it is exercising wisdom as much as possible. Further, it is clear that the pleasure that comes to be from exercising wisdom and contemplating, either alone or |59.10| most of all, is necessarily the one that comes from living. Therefore, living pleasurably and true enjoyment belong to philosophers alone or to philosophers most of all. For the activity of the truest thoughts, that is, the one being filled with the things that are most of all beings and always stably preserving the completeness it is granted,

41. Reading τοῦτο καὶ ἐπὶ τῶν ἄλλων.

|59.15| this is of all things the most efficacious for gladness. So for the very enjoying of the true and good pleasures too, those who have understanding must philosophize.

12. If one should not only deduce this from the parts [of happiness], but also establish the same thing from higher up, from happiness as a whole, |59.20| let us say explicitly, then, that as philosophizing stands in relation to happiness, so too it is disposed to be in relation to our excellence or baseness. For everyone must choose everything either in relation to it or because of it, and among the things because of which we become happy, certain ones are necessary, |59.25| while others are pleasant. Thus, we set down happiness as either being wisdom or some sort of theoretical wisdom, or virtue, or maximal enjoyment, or all of these. If it is wisdom, it is evident that **|60.1|** living happily would belong only to philosophers. And if it is virtue of the soul or enjoyment, even in this case it would belong only to philosophers or most of all to them. For virtue is the most controlling thing within us and, compared to each other thing separately, wisdom is the most pleasant of all things. |60.5| And similarly if one were to say that happiness is all of these things, one must delimit them by the exercise of wisdom. So anyone who is able must philosophize; for this is either the completeness of living well or, at any rate, most of all, one might say, comparing one to another, the cause of [living well] in our souls. But here [in the sublunary world], on account of |60.10| our kind being perhaps contrary to nature, it is difficult to learn and inquire, and we can scarcely perceive, due to our naturally bad disposition and our living contrary to nature. But were we able to safely return again from where we came from, it is clear that we all would do these things more pleasantly and easily. For now, |60.15| though, having departed from the good things, we do the necessary ones, and those who do this most of all are those who are considered most blessed by ordinary people. But if we were to take the heavenly route and support this life of ours steadily on the orderly star, then we will philosophize |60.20| while living a true life and contemplating beauty with extraordinary contemplation, gazing intently with the soul at the truth, and contemplating the starting-point of the gods, being continuously rejoiced and enjoyed thanks to contemplating, and feeling pleasure **|61.1|** apart from all pain. If we proceed in this way to the whole of happiness, we will discover that philosophizing contributes to it for us. That is why sharing in it is of worth, as being the most excellent and fitting thing for us.

1.7 *ON EDUCATION*

F91 *R62 Plutarch,* Quaestiones Conviviales *8.10 734D*

Florus . . . testifies to Aristotle's claim that polymathy produces many puzzles.

F92 *R63 Diogenes Laertius 9.53*

And [Protagoras] was the first to discover the so-called porter's knot for carrying loads, as Aristotle says in *On Education*, since he was a porter, as Epicurus also says somewhere.

1.8 *NERINTHUS*

F93 *R64 Themistius,* Oration *33*

The Corinthian farmer, being acquainted with Gorgias (not the real Gorgias, but with the dialog Plato wrote to refute the sophist), immediately afterward left the farm and vineyard and offered his soul to Plato and sowed and planted Plato's seeds. This is the man whom Aristotle honors in the Corinthian dialog.

1.9 *SOPHIST*

F94 *R65A Diogenes Laertius 8.57*

In the *Sophist*, Aristotle says that Empedocles was the first to discover rhetoric and Zeno was the first to discover dialectic.

F95 *R66 Diogenes Laertius 6.63*

Aristotle says that [Empedocles] was free and a stranger to all rule, if indeed he declined the kingship when it was given to him, as Xanthus says in the works about him, since he clearly cared more for simplicity.

F96 *R67 Diogenes Laertius 9.54*

[Protagoras] read [*On the Gods*] to the Athenians in the house of Euripides, or as some say in the house of Megacleides. Yet others say in the Lyceum, making use of the voice of his student Archagoras son of Theodotus. Pythodorus son of Polyzelus, one of the Four Hundred, accused him, but Aristotle says it was Euathlus.

1.10 *ON RHETORIC* OR *GRYLUS*

F97 *R68 Diogenes Laertius 2.55*

Aristotle says that countless people composed encomia and funeral orations for Grylus, partially to gratify his father.

F98 *R69 Quintilian 2.17.14*

Aristotle, as he was accustomed to do, and out of pure love for the search of knowledge, thought up some subtle arguments of his own in the *Grylus* [for the conclusion that rhetoric is not a craft]. But he also wrote three books on the craft of rhetoric, and in the first of these, he not only acknowledges it as a craft knowledge, but also assigns it a part of politics, just as he assigns it a part of dialectics.[42]

42. *Rh*. 1359^{b}10.

1.11 *ON POETS*[43]

F99 *Vita Aristotelis Marciana 4 (Janko T3b)*

When [Aristotle] was still young, he received the education that is suitable for a free person, as is clear from the *Homeric Inquiries* written by himself, the edition of the *Iliad* that he gave to Alexander the Great, the dialog *On Poets*, the treatise the *Poetics*. . . .

F100 **Dio Chrysostom 53.1 (Janko T4)*

Aristotle—who they say was the originator of literary criticism and grammar—discusses the poet[44] in many dialogs, on the whole admiring and praising him.

F101 **Philodemus,* On Poems *4, col. 106, 6–10 (Janko F3)*

But it is necessary to look at all the views of Aristotle and his circle—which we have described—concerning imitation.

F102 **Philodemus,* On Poems *4, from col. 107, 6–13 (Janko F6a)*

All objects of each imitation are composed with a view to the people acting. But they produce imitations of the actions of people in action only as regards their words, not through the elaboration of spectacle, but through words.

F103 **Philodemus,* On Poems *4, col. 110, 12–20 (Janko F10)*

Sometimes he happened to wish that people be painted as beautiful, other times as ugly. Of course, paintings by most of the later painters are seen to be of the former, not of the latter. The saying goes "not even Apelles painted them as they truly are."

F104 **Philodemus,* On Poems *4, col. 118, 14–22 (Janko F23)*

We say that as the actors stand to the tragic poets and the rhapsodes stand to the epic poets, so the pipe and lyre players stand to lyric poets.

F105 *R70 Diogenes Laertius 8.57 (Janko F73)*

In *On Poets* [Aristotle] says that Empedocles had a Homeric style and was stylistically competent, being skilled in the use of metaphor and other poetical techniques, and that, although he wrote other poems too, such as the *Crossing of Xerxes* and a *Hymn to Apollo,* his sister—or daughter, as Hieronymus says—later burned these, the *Hymn* unintentionally, the Persian works intentionally, because they were unfinished. And, generally speaking, he says that Empedocles wrote tragedies and political works.

43. Text: R. Janko, *Philodemus* On Poems *Books 3–4 with the Fragments of Aristotle* On Poets (Oxford, 2011).
44. Homer.

F106 *R72A Diogenes Laertius 3.47–8 (Janko F44e)*

They say that Zeno the Eleatic was the first to write dialogs. But Aristotle in the first book of *On Poets* says it was Alexamenus of Styra or Teos—as Favorinus also says in the *Recollections*. But it seems to me that Plato, since he made the form exact, would also justly take home the first prize, as much for its beauty as for its discovery.

F107 *R73 Diogenes Laertius 3.37 (Janko F43b)*

Aristotle says that Plato's form of writing is between poetry and prose.

F108 *R74 Macrobius,* Saturnalia *5.18, 19–20 Willis (Janko F58)*

I set down Aristotle's own words from the second book of *On Poets* where, speaking about Euripides, he says: "Euripides says 'the sons of Thestius' went with their left foot unshod. At any rate, he says that 'on their left foot, they were unshod, while the other had sandals, so they would have their knee light.' But in fact the custom is entirely the contrary for the Aetolians, since they are shod on the left but unshod on the right. For one should, I think, have the leading one light, not the one that stays put.

F109 *R75A Diogenes Laertius 2.46 (Janko F66a)*

According to Aristotle in book three of the *Poetics*, a certain Antilochus of Lemnos and Antiphon the soothsayer were rivals of Socrates, just as Kylon and Onatas were of Pythagoras.

F110 *R76A Pseudo-Plutarch,* Life of Homer *1.3–4, 21–63 Kindstrand (Janko F65a)*

In book three of the *Poetics*, Aristotle says that . . . when the Lydians were being oppressed by the Aeolians and had decided to leave Smyrna behind, the leaders summoned anyone who wished to follow them to leave the city. Homer, who was still a small child, said that he too wished to "join up" (*homêrein*), which is why he was called "Homer" instead of "Melesigenes."

F111 *R81A Proclus, On Plato's* Republic *42.10–20, 49.13–19, 50.17–29 Kroll (Janko F56)*

Why on earth does Plato not allow tragedy and comedy, when these contribute to a purification of the feelings, which cannot be completely shut out nor, on the other hand, is it safe to fill them all the way up? Indeed, they need some movement at an opportune time that, when they are filled up by hearing poetry, makes us undisturbed by them during the rest of the time. . . . Casting out tragedy and comedy is absurd, if indeed through them it is possible to satisfy feelings in due measure and fill up ones that are serviceable for education, since they provide therapy for the painful part of the feelings. And this provided Aristotle and those competing on behalf of these sorts of

poetry in the speeches against Plato great occasion for complaint. We will resolve this by following the previous arguments in the same way. . . .

We also claim that it is necessary for the politician to contrive certain purges of those feelings, but not so that we are led to passionate attachment to these, but, on the contrary, so that we bridle and harmoniously restrain their movements. Therefore, those sorts of poetry that aim at ornamentation and are immoderate in calling forth these feelings are exceedingly short of being useful for purification. For purifications do not reside in excesses but in contracted activities which bear little resemblance to what they are purifications of. Therefore, if we should not make those being educated into lamentation-lovers or laughter-lovers, it would not be necessary for them to be conversant with those imitations that multiply both of these feelings.

1.12 *ON THE POLITICIAN*

F112 *R78 Cicero,* Letter to Quintus *fr. 3.5*

Aristotle wrote with himself as speaker about the most excellent constitution and man.

F113 *R79 Syrianus, On Aristotle's* Metaphysics *168.33–35 (1087^{b}33–1088^{a}14)*

In the second book of the *Politician* . . . [Aristotle] writes explicitly, "The good is the most exact measure of all things."

F114 *R80A Seneca,* On Anger *1.3*

Aristotle's definition does not depart much from ours. For he said that anger is the desire to pay back a pain.

F115 *R80B Seneca,* On Anger *1.9.2*

Aristotle says that anger is necessary and that nothing can be conquered without it, unless it fills the soul and kindles the spirit. However, it is not to be used as a leader but as a soldier.

F116 *R80C Seneca,* On Anger *1.17.1*

Aristotle says that certain feelings, if one uses them well, serve as weapons.

F117 *R80D Seneca,* On Anger *3.3.1*

However, as I said in the previous books, Aristotle stands as a defender of anger and forbids us from cutting it out. For he says that it is a stimulus to virtue. For when it is taken away, the soul becomes defenseless and too sluggish and weak for great enterprises.

F118 **Philodemus,* On Rhetoric *2.175, fr. 15*

According to Aristotle a hare appearing among dogs cannot be saved, nor can someone judged doglike and despicable among human beings.

1.13 *ON JUSTICE*

F119 *Cicero,* On the Commonwealth *3.12*

[Aristotle] filled up a good four large books about justice.

F120 *R82 Demetrius,* On Style *28*

In Aristotle's *On Justice*, at any rate, if the one lamenting the city of Athens were to say "What a great enemy city they captured, as great as their own that they lost," he would have spoken passionately and lamentingly. But if he were to do the same thing using similar endings, "What a great enemy city they took, as great as their own that they forsook," this does not move us to feelings, by Zeus, but moves us to the so-called tears of laughter.

F121 *R83 Athenaeus 6D*

[Aristotle] writes somewhere that "those making public speeches among the crowds spend the whole day relating marvelous things, even with people who have sailed down the Phasis or Borysthenis Rivers, when they know nothing themselves except Philoxenus' *Dinner*, and not even the whole thing."

F122 *R85B Lactantius,* Epitome of the Divine Institutes *c. 55*

Most of the philosophers, but especially Plato and Aristotle, said many things about justice, defending it and extolling this virtue with the highest praise, each offering his own, because it preserves equality in all things: and when other virtues are, so to speak, silent and held within, only justice, which is neither beloved for itself alone nor secret, but is completely outwardly directed and inclined toward doing good, so that it may profit as many as possible.

F123 *R87 Boethius, On Aristotle's* De Interpretatione *27.13*

Aristotle . . . in his work *On Justice* said, "Intelligible objects and perceptual objects are immediately distinguished by nature."

F124 *R89 Cicero,* On Duties *2.16.56–57*

How much more serious and true is Aristotle's censure of us for not being astonished at this pouring forth of riches in order to soothe the masses. But if those who are besieged by enemies were compelled to pay a mina for a pint of water, at first it would seem incredible to us and everyone would be astonished, but if they were to pay attention to it, they allow it as stemming from necessity. But at this enormous expense and boundless outlay, we are not at all greatly astonished, even though no necessity is being relieved nor merit increased, and even though that very pleasure of the masses would remain for an extremely brief time and also so trifling that at the same moment as it is sated, even the memory of the pleasure dies. He rightly concludes that these things

gratify children, women, slaves, and slavish freemen, but can in no way be approved by a serious man who weighs things with firm judgment.

1.14 *ON GOOD BREEDING*

F125 *R91 Stobaeus,* Anthology *4.29A24*

From Aristotle, *On Good Breeding*: "Concerning good breeding in general, I am puzzled as to whom one should call 'well-bred.'" "It makes perfect sense," I said, "that you are puzzled about this. For some matters are disputed both among ordinary people and even more among wise ones, while others are not stated perspicuously—for example, to start with, matters concerning [good breeding's] capacity. I mean, whether it is one of the estimable and excellent things or, as Lycophron wrote, something completely empty. For when he compares it to other goods, he says that the nobility of good breeding is obscure, its dignity a matter of words, since one chooses it [solely] with a view to reputation, while in truth there is no difference between the well-bred and the ill-bred.

F126 *R92 Stobaeus,* Anthology *4.29A25*

In the same work: "Just as there is dispute about what height is good [for us to have], so there is also dispute about whom one should call 'well-bred.' For some people think that the well-bred are those who have good ancestors, as Socrates also thought (since it was due to Aristides' virtue[45] and his daughter's being true to her stock[46]). They say that when Simonides was cross-examined about who was well-bred, he said 'Those from old money.' Nonetheless, according to the same account, Theognis was not right to object, nor was the poet, when he wrote: 'Mortals praise good breeding, but they marry wealthy people.'[47] Or is it not the case, by Zeus, that the man of wealth is more choiceworthy than the one who is poor but has a wealthy great-grandfather or some other ancestor?"

"How could it be otherwise?" he said.

"And so one should marry those who are wealthy rather than those who are well-bred. For the ones who used to be wealthy are well-bred, but those currently wealthy are more powerful. Is it not the same, then, if someone did not take those well-bred to be those from old money, but instead those from old *good* ancestors? For fresh virtue would seem to be better than old virtue and each person has more in common with his father than his great-grandfather, and it is more choiceworthy to be excellent oneself than for one's great-grandfather or another of one's ancestors to be so."

"What you say is correct," he said.

"Then, since we do not see good breeding to be either of these things, mustn't we look in another way to see what it resides in?"

---

45. According to one ancient tradition, Socrates was married to Myrto, the great-granddaughter of Aristides the Just, as well as to Xanthippe.
46. *Rh*. 1390^{b}21–23.
47. Euripides, Fr. 399 Nauck.

"We must," he said.

"'Well (*eu*),' of course, signifies something praiseworthy and excellent—for example, well-looking (*euprosôpon*) or well-sighted (*euophthalmon*). For, in accord with its account, it signifies something good or beautiful."

"Certainly," he said.

"Well-looking, then, is having the virtue of looking, and well-sighted is having the virtue of the eye?"

"So it is," he said.

"But surely one sort of family is excellent, another base and not excellent."

"Certainly," he said.

"And we say, at any rate, that each thing is excellent in accord with its own virtue, so that a family would be excellent in the same way."

"Yes," he said.

"Then it is clear," I said, "that good breeding is virtue of family."

F127 *R94 Stobaeus,* Anthology *4.29C52*

"It is evident, therefore," I said, "concerning what we were going through puzzles about before, why those from old money, or from once excellent people, are considered to be more well-bred than those whose acquisition of those goods is closer at hand. For a person's own excellence would be closer at hand than [that of] someone who happens to have an excellent grandfather, so the result would be that it is the good man who is well-bred. And some have spoken in this way, claiming to refute good breeding on the basis of this deduction, just as Euripides too says that good breeding belongs not to those with good ancestors but to whomever is simply a good man. But this is not so. Rather, those who set out the case for ancient virtue inquire correctly. Let us state the causes of this. Good breeding is virtue of family, and virtue is characteristic of excellent people. A family is excellent if many excellent people have naturally come to be in it. And this sort of thing happens when there came to be a good starting-point in the family. For the starting-point has this capacity, namely, to produce many things like itself. For this is the work of a starting-point: to produce many other things like itself. When, then, one such man has come to be in a family, one so excellent that the good coming from him is possessed by many generations, this family is necessarily excellent. For there will be many excellent human beings if the is family is a family of human beings, and horses if the horse is family, and likewise in the case of the other animals. So, it is reasonable that neither the wealthy ones nor the good ones would be well-bred, but those from old money or old good ancestors. For this argument seeks the truth; for the starting-point is superior to all. Nonetheless, those who come from good ancestors are not always well-bred, but rather those who happen to have originators among their ancestors who are good. When a person is good himself, but does not have this sort of natural capacity to beget many like himself, in these cases, the starting-point does not have this sort of

capacity. [But where the starting-point does have this sort of capacity there is][48] virtue of family and those who come from this family are well-bred, not if the father is, but if the originator of the family is. For the father does not beget someone good because of himself, but because he was from a family of this sort.

1.15 *ON LOVE*

F128 *R95 Athenaeus 674B*

Aristotle, in the second book of *On Love*, and Ariston the Peripatetic (whose family is from Ceos) in the second book of his similar *On Love*, say that the ancients, due to hangovers from wine, discovered headbands by coincidence, since binding the temples seemed to help. But later people, while binding the temples, added some decoration appropriate for the pastime of wine drinking, inventing the crown. But it is better for the head to be crowned because all the perceptual modalities are in the head rather than because covering and binding the temples is advantageous when it comes to wine.

F129 *R96 Athenaeus 564B*

Aristotle says that lovers gaze at no part of their beloved's body other than the eyes, where shame dwells.

F130 **Stobaeus,* Anthology *4.21.11*

Aristotle says that [someone's] beauty is a better introduction than any letter.

F131 **Stobaeus,* Anthology *4.21.14*

Aristotle, when asked why love is of beautiful things, said "This is the question of a blind person."

F132 **Al-Dailami, Tübingen Weisweiler 81 (Walzer)*[49]

It is narrated in a book by some ancient author that one day Aristotle's students came to him. He told them: "While I was standing on a hill, I saw a young man on a roof reciting a poem that meant, 'He who is willing to die for the sake of love, let him die so, for, there is no point in love if it evades self-sacrifice.'" His pupil Issus asked him: "Tell us, philosopher, about the nature of love and its consequences." He replied: "Love is a craving that emerges in hearts. When it emerges, it moves, grows, and flourishes fully. When it fully flourishes, the elements of greed overwhelm it. The stronger it grows in the depths of the heart, the more agitated, insistent, longing, worried, and anxious the lover becomes. That is why the lover is eager to achieve what he loves and tries for it so much so that it winds up in anxiety, grief, permanent insomnia, constant thirst, melancholia, and finally, insanity."

48. Added to fill a lacuna in the text.
49. Translated by Hashem Morvarid.

1.16 *SYMPOSIUM*

F133 *Plutarch,* Quaestiones Conviviales *6*

The most eloquent of philosophers, Plato, Xenophon, Aristotle, and Speusippus as well as Epicurus, Prytanis, Hieronymus, and the academic Dion, bear witness that the task of writing up speeches to be given along with drinking is worthy of some effort.

F134 *R100 Athenaeus 188E*

It is unfitting, Aristotle says, to enter a symposium all sweaty and dirty.

F135 *R101 Athenaeus 674F*

As it is in fact also more colorful and graceful to the gods, Sappho commands those sacrificing to wear a crown. But Aristotle, in the *Symposium*, says that we should not offer anything mutilated to the gods, but only what is complete and whole. But what is full is complete and "to crown" signifies a certain fulfillment. Homer: "Young men crowned the mixing bowl with drink" and "but the god crowns their shape with words."[50] For he says that persuasive speech fills out again those whose appearance is without shape. The crown, then, seems to tend to do this. That is why we also provide the contrary when it comes to grief; for we mutilate ourselves by cutting our hair and removing our crowns in sympathy with the distressed.

F136 *R104 Athenaeus 641D–E*

In *On Drunkenness*, Aristotle calls them "second courses" in much the same way we do, as follows: "One must consider dessert (*tragêma*) to be as wholly different from food proper as something to be eaten is from something to be nibbled (*trôgalios*). For the latter is the ancient name among the Greeks for foods served for dessert. That is why the first person who called it the 'second course' seems not to have spoken badly. For the eating of dessert is a sort of after-dinner thing, and desserts are served as a distinct course."

F137 *R105 Pseudo-Julian,* Epistle *24 391B–C*

A fig is not only sweet to taste, but even better as an antidote. As such, it is so beneficial for humans that Aristotle actually says that it is an antidote for every deadly poison, and it is for no other purpose than this that it is served at meals and as a dessert, as if in place of any other divinely protective medicine, it envelops the injurious elements in foods.

F138 *R106 Athenaeus 447A–B*

But as Aristotle says in *On Drunkenness* . . . "something special happens with barley drinks, which they call *pinon*. For those who get drunk on other intoxicants fall on all

50. *Iliad* 1.470, *Odyssey* 8.170.

their parts; for they fall on the left, the right, face down, and face up. But only those who get drunk on *pinon* fall backward and face up."

F139 *R107 Athenaeus 429C–D*

In *On Drunkenness*, Aristotle says: "If the wine is moderately boiled down, those who drink it get less drunk," for when it is boiled down, its capacity becomes weaker. "But older people," he says, "get drunk most quickly because of the small amount and weakness of the heat present in them by nature. And the very young get drunk rather quickly because of the large quantity of heat present in them; for they are easily defeated by the addition of heat coming from the wine. Also, among the non-rational animals, pigs, when fed pressed grapes, get drunk, as do the raven kind and the dog kind, when they eat the plant called 'wine-cake,' and so do monkeys and elephants when they drink wine. That is also why they catch monkeys by getting them drunk with wine and catch ravens with wine-cake."

F140 *R108 Plutarch,* Quaestiones Conviviales *650A*

Florus was amazed that, when Aristotle wrote in *On Drunkenness* that old people are seized by drunkenness the most and women the least, he did not elaborate on the cause, although he did not usually neglect such things.

F141 *R109 Athenaeus 429F*

Aristotle says that from three cotyles of the wine they call *samagoreion* over forty men will become drunk.

F142 *R110–111 Athenaeus 464C–D*

In *On Drunkenness*, Aristotle says, "The so-called Rhodian cups are introduced in connection with drinking both because of the added pleasure they bring to the drinks and because they make the wine less intoxicating when warmed. For they boil myrrh, camel hay, and other sorts of ingredients in water, and when poured into the wine they make it less intoxicating." But in another part he says, "Rhodian cups are produced when myrrh, flowering camel hay, saffron, balsam, cardamom, and cinnamon are boiled together. What is produced from these, when it is poured into the wine, stops drunkenness, so that, when it concocts the breaths, it even enfeebles sexual desire."

1.17 *ON WEALTH*

F143 **Philodemus,* On Household Management *col. 21, 18–35 (Tsouna)*

The clever ones are drawn by the habits of ordinary speech into denying the facts, and then teach as if they were refuting ordinary people, whenever ordinary people apply

predicates to the same things in a way contrary to their own, teaching something that they do not know. This is precisely what happened to Aristotle in developing the argument in *On Wealth* for the claim that the good man is also a good moneymaker, while the bad man is also a bad moneymaker, as Metrodorus showed.

2. Logic

2.17 *ON PROBLEMS*

F144 *R112 Alexander of Aphrodisias, On Aristotle's* Topics *63.9–13*

Since the things said in this way ("Why is this so?" or "What is this?") are not even premises to start with, they cannot be dialectical problems either: rather, things put forward in this way are problems of natural science, as [Aristotle] also said in *On Problems*; for natural things whose causes are unknown constitute problems of natural science.

2.18 *DIVISIONS*

F145 *Philoponus, On Aristotle's* On Coming to Be and Passing Away *226.16–24 (330^{b}15)*

One must inquire about which are the works [Aristotle] calls "*Divisions*," in which he says Plato arranges these things. Now, the commentator Alexander says that the *Divisions* of Plato in circulation is spurious, but it could be, he says, that Aristotle, speaking about the things said in the dialog the *Sophist*, called the things in that work "*Divisions*." But first one must see that there is no "*Divisions*" at all in circulation ascribed to Plato, and that nothing appears in the *Sophist* that is like what Plato is supposed[51] to have said here.

F146 *R113 Alexander of Aphrodisias, On Aristotle's* Topics *242.3–9 (116^{b}37)*

He uses the words "more noble," "more estimable," and "more praiseworthy" in their more common sense. For in the *Division of Goods*, he says that, of the goods, the estimable ones are those that have more the character of starting-points, such as gods, parents, and happiness; noble and praiseworthy ones are the virtues and the activities in accord with them, and the capacities in which there is the possibility of good and bad use; and beneficial, on the other hand, are things that are productive of these same goods and contribute to them. But here the noble, praiseworthy, and estimable seem to be brought under the heading of things that are good as capacities.

F147 *R114 Diogenes Laertius 3.80, 3.109*

Aristotle says that Plato divided things in the following way. . . . And according to Aristotle he [Plato] divided the primary things in this way.

51. *GC* 330^{b}16.

F148 *R115 Codex Marcianus g. 257*

Aristotle's *Divisions*: The soul is divided into three. . .

2.19 *LOGICAL NOTES*

F149 *R116 Simplicius, On Aristotle's* Categories *65.2–10*

But in which category will negations, privations, and the different inflections of verbs be placed? Or rather did Aristotle himself answer this in the *Notes*? For in the *Methodics*, in his notes, and in the *Divisions*, as well as in the other notes titled *On Style* (which, even if it does not seem to some to be a genuine work [of Aristotle's], was nonetheless composed by someone from his school), when putting forward the categories he inserts "I mean these with their endings" or inflections, and combines the teaching of them together with negations, privations, and indefinite terms.

2.20 *CATEGORIES*

F150 *R117A Simplicius, On Aristotle's* Categories *18.16–21*

In *On the Order of Aristotle's Writings*, Adrastus recounts that another book of categories was also transmitted as being by Aristotle and that it was short and in a summary style and was distinguished by a small number of divisions. It began with: "Of the beings, some are. . . ." He records, however, the same number of lines in both works, so by stylistic brevity he means that each of the dialectical arguments was set out in a concise manner.

F151 *R117B Ammonius, On Aristotle's* Categories *13.20–25*

One should know that in the old libraries, forty books of the *Analytics* have been found and two books of the *Categories*. While the latter has the inscription and says at the start: "Of the beings, some are said to be homonymous, others synonymous," the second, which we now have set before us, had the following inscription: "Things are said to be homonymous whose name alone is common, while the definition of their substance is distinct."[52] This one is preferred as being superior in organization and in content, and everywhere proclaiming Aristotle as its author.

2.21 *ON CONTRARIES* (*On Opposites*)

F152 *R118B Simplicius, On Aristotle's* Categories *387.18–388.1*

Since the Stoics think highly of their work on logic, both in other cases and in the case of contraries, they were eager to prove that Aristotle supplied the resources for everything in one book, which was entitled *On Opposites*, which in fact included an enormous number of puzzles; of these, they have provided a small part. And while it is not reasonable to include the others in an introduction, all the ones that the Stoics deal

52. Cf. *Cat*. 1[a]1–2.

with in agreement with Aristotle must be spoken about. An old definition of contraries has been set down (which we mentioned previously), namely, that they are the things in a kind that differ most from each other; Aristotle examined this definition in *On Opposites* and tested it in many ways. For he asked whether the things that differ are contraries, whether the difference can be contrariety, whether the whole distance [between the contraries] is the one that differs the most, and whether the things furthest apart are the same as the things that differ the most, what the distance is, and how one must understand "furthest apart." In the face of evident absurdities, one must add something about the kind, in order that the definition would be, "the things furthest apart in the same kind." And [he asked] what absurdities follow from this, and whether contrariety is characteristic of distinctness, and whether the most distinct things are contraries, and he set down many other refutations. . . . This is but a small part of the puzzles raised by Aristotle in his work *On the Contraries*.

F153 *R119B Simplicius, On Aristotle's* Categories *389.5–10*

Aristotle says in *On Opposites* that justice is the contrary of injustice. But he claims that the just *person* is not said to be contrary to the unjust *person*, but rather that they are contrarily disposed. But if these things are also contraries, he says, "contrary" will be said of things in two ways. For things will either be said to be "contraries" intrinsically (for example, virtue and vice, movement and rest), or else by partaking of contraries (for example, what is in movement would be contrary to what is at rest and the good thing contrary to the bad thing).

F154 *R120 Simplicius, On Aristotle's* Categories *389.28–390.6*

These issues were first distinguished by Aristotle who says that a non-composite is not contrary to the definition of its contrary (for example, practical wisdom is not contrary to ignorance of what is good, bad, and neither good nor bad), but if this is the case, it is in accord with conjunction that the definition is to be set against the definition, and the definitions said to be "contraries" by being of contrary things. And he practices his craft about these matters further: one definitory account is contrary to another if there is a certain contrariety regarding the kind, the differences, or both. For example, the definition of the beautiful (let us say) is concordance of parts with each other, and the contrary to this is discordance of parts with each other. And this contrariety is due to the kind. But in other cases it is due to the differences—for example, white is color able to dilate sight, while black is color able to contract it.[53] For in these, the kind is the same, but the contrariety is in accord with the differences. Then it is said how an account is contrary to an account. Even accounts indicating the substance will be contrary.

53. Plato, *Timaeus* 67d–e.

F155 *R121 Simplicius, On Aristotle's* Categories *390.19–25*

Aristotle, in the book *On Opposites*, asked whether, if someone who loses one of two [contraries] does not necessarily acquire the other, must there be something in the middle, or is this not always the case? For the one losing the true belief does not necessarily take on the false belief, nor the one losing the false belief the true one, but sometimes the change is from this belief to supposing nothing at all, or to scientific knowledge. But there is nothing in the middle of true and false belief, if not ignorance or scientific knowledge.

F156 *R122–123 Simplicius, On Aristotle's* Categories *402.30–403.1*

Aristotle did not take [the distinction between] state and privation from the case of habit, but from the case of what is by nature, and in the latter case the opposition that is in accord with state and privation is said of things in the strict sense. . . . In *On Opposites*, he says that privations are said to be of things that are in accord with nature, habitual things, possessions, and of other things as well. Blindness is a privation of natural things, nakedness a privation of habitual things, lack of money a privation of things present for use. There are also many other sorts of privations, and from some privations there is no release, but from others there is.

F157 *R124 Simplicius, On Aristotle's* Categories *409.29–410.2, 410.25–30*

In the book *On Opposites*, [Aristotle] added the following sorts of contrariety: the things neither good nor bad in relation to the things neither good nor bad, saying in this way that white is contrary to black and sweet to bitter and high pitch to low pitch and rest to movement. . . . Nicostratus reproaches [Aristotle] first [saying] that the division of contraries is incomplete, for he did not add that the indifferent is contrary to the indifferent. However, in the book *On Opposites*, Aristotle adds this, saying there is some manner of opposition of what is neither good nor bad in relation to what is neither good nor bad, as was said earlier. But he did not call them "indifferents," I think, because this more recent meaning of the word "indifferent" was posited by the Stoics.

3. Rhetoric and Poetics

3.22 *COLLECTION OF THE* "CRAFT" *OF THEODECTES*

F158 *Valerius Maximus 8, 14, ext 3*

Aristotle gave books about the craft of rhetoric that he produced to his student Theodectes and then out of offense when the title of this work was ceded to the latter, while claiming

some things in a book of his own, he added that he had discussed them more fully in the books of Theodectes.

F159 *R125 Quintilian 2.15.10–12n*

For that reason, they appear to themselves to be more assiduous, who, though they feel the same about rhetoric, praise it as the power of speaking persuasively. Gorgias makes this its definition . . . as he was compelled to by Socrates. Theodectes does not dissent from this, whether or not the work about rhetoric that bears his name is his or, as it is believed to be, is Aristotle's. In this book, the definition of rhetoric is to lead people by [the power of] speech to what the orator wants.

F160 *R127A Dionysius of Halicarnassus,* On the Combination of Words *2.1–7 (Usener-Radermacher)*

Synthesis, just as its name implies, is a certain sort of placement (*thesis*) of parts one next to the other [in a sentence] (which some people also call elements of speech). Theodectes and Aristotle and those who philosophized with them for a long time named these three: nouns, verbs, and conjunctions, making of them the primary parts of speech.

F161 *R134 Anonymous Seguerianus,* Craft of Political Rhetoric *208 (Rhetores Graeci I p. 454 Sprengel)*

In the *Theodecteian Crafts of Rhetoric*, Aristotle says that the epilog has as its main goal to exhort the listeners, and that we exhort in three ways, referring the things that produce exhortations for each person to his feelings. The first work of the epilog is to awaken feelings. The second is to praise or blame, for the place for these is in the epilog. And the third is to remind the audience of what has been said. And one must not insert things that are easy to remember or that excite no feelings.

3.23 *COLLECTION OF "CRAFTS" OF RHETORIC*

F162 *R136A Cicero,* On Invention *2.2*

Aristotle collected into one place the ancient writers of the "Craft" of rhetoric going all the way back to the first writer, the discoverer of it, Tisias, and has combined with perspicuity their precepts, mentioning them by name, after having sought them out with great care, and explained them assiduously.

F163 *R137 Cicero,* Brutus *12*

Aristotle said that when the tyrants in Sicily were removed and private matters were prosecuted in the courts after a long interval, because that race was of a clever and disputatious nature, Corax and Tisias of Sicily were the first to write about the craft and its precepts. For before them no one was accustomed to speaking with method or craft, although there were several who spoke accurately and in detail. Discussions of

important issues were also written down and prepared by Protagoras, which are now commonly called "common places."[54] Gorgias did the same, composing praises and censures about particular matters, because he considered the proper task of an orator to be able to enhance and in turn diminish something by means of praise and blame.

3.24 *HOMERIC PUZZLES*

F164 *R149 Porphyry 2.13.5–114.7 (Schrader; *B-Scholiast on Iliad 3.277)*

"Helios[55] who oversees all things": Why does [Homer] say that Helios oversees and listens to all things, since, when it comes to his own cattle, he writes that he needs a messenger: "Swift Lampetia with the flowing robe came to Hyperion Helios as messenger that the companions had killed his cattle"? Aristotle solves this puzzle by saying that either Helios sees all things but not all at the same time, or else that Lampetia relayed the message to Helios in the same way sight does to a human being. Or else, he says, it would be fitting for Agamemnon to speak in this way when swearing an oath in single combat, "Helios who oversees and listens to all things," and also Odysseus when speaking to his companions. For indeed he did not see the things in Hades either.

F165 *R166 Porphyry 1.267.1–4; 268.1–3 (Schrader; *B-Scholiast on Iliad 24.15)*

Why did Achilles drag Hector around Patroclus' grave, acting contrary to the customs for the dead? . . . Aristotle says that it is possible to solve this puzzle by referring back to the sorts of customs that were present then, since even now in Thessaly they drag [the dead bodies] around graves.

F166 *R172 Porphyry 2.84.13–17 (Schrader; HQV Scholiast on Odyssey 9.106; T Scholiast on Odyssey 311)*

Aristotle asks how the Cyclops Polyphemus came to be a Cyclops, although neither was his father a Cyclops (since it was Poseidon) nor was his mother a Cyclops. He solves it drawing from the myths: for in fact horses were born from Boreas,[56] and the horse Pegasus was born from Poseidon and Medusa.

*3.25 *POETICS* BOOK 2

F167 *Tractatus Coislinianus*[57] *(Janko)*

1. Of poetry, one part is non-imitative. Of this, one part is historical, another pedagogical. Of the pedagogical, one part is instructive, another contemplative.

54. *Topoi* in Greek.
55. The sun personified as a god.
56. The north wind.
57. So called from the Parisian codex (number 120 in the Coislin collection).

2. [Another part of poetry] is imitative. Of imitative poetry, one part is narrative, another is dramatic, that is, [directly imitative of] action. Of dramatic poetry, one part is comedy, another tragedy, another mime, and another satyr play.

4. Comedy is an imitation of an action that is ridiculous, lacking in magnitude, complete, in embellished speech, with each of its forms used separately in the parts of the work, by people acting and not by narration, accomplishing through pleasure and laughter the purgation of such feelings. Laughter is its mother.

5. Laughter is produced from the style of speech and from the subject matter; from homonymy; from synonymy; from babbling; from paronymy (by adding or subtracting an ending), diminutives, and alteration . . . ; from parody; from transference . . . ; from style of speech.

6. Laughter from the subject matter: from deception; from likeness, used either for the better or for the worse; from what is impossible; from what is possible but does not follow; from things that are contrary to expectation; from making characters with a tendency to wickedness; from using unrefined dancing; when someone who has the power misses the best things and gets the most base ones; whenever speech is disconnected and has no inferential structure.

7. Comedy differs from abuse, since abuse openly recounts the bad things, but comedy requires what is called "innuendo."

8. The mocker wants to expose faults of soul and body.

9. There should be proportionality of fear in tragedy and of what is ridiculous in comedy.

10. The forms[58] of comedy: plot, character, thought, style of speech, music, spectacle.

11. The comic plot is one composed around ridiculous actions.

12. The characters of comedy are the buffoons, the self-deprecators, and the boasters.

13. There are two parts of thought: maxim and means of persuasion. There are five means of persuasion: oaths, agreements, witnesses, tortures, and laws.

14a. Comic style of speech is common and popular.

58. I.e., the parts.

14b. It is necessary for the comic poet to attach to the characters their own native dialect and the local dialect to himself.

15a. Song is special to music; thus, it is from the latter that one must take the completed resources.

15b. Spectacle provides as a great benefit to plays what is in concord with them.

16. Plot, style of speech, and song are observed in all comedies, but thought, character, and spectacle in not a few.

17. There are four parts of comedy: prolog, choral part, episode, and exit. The prolog is the part of a comedy before the entrance of the chorus. The choral part is the song sung by the chorus, whenever it has sufficient size. The episode is the part between two choral songs. The exit is the part spoken at the end by the chorus.

18. [The three types of comedy]: old, which has an overabundance of what is ridiculous; new, which abandons this and inclines toward the dignified; and middle, which mixes these two.

4. Ethics

4.25 *EXCERPTS FROM PLATO'S* REPUBLIC

F168 *R180 Proclus, On Plato's* Republic *8.12–14*

They also testify that the title "*The Republic*" was very old. For Aristotle, when excerpting the treatise says he is "excerpting *The Republic.*"

4.26 *RULES FOR COMMUNAL MESSES*

F169 *Athenaeus 186B*

The philosophers gathering young men with them took care to feast according to some rule that had been set down. Indeed, there were rules for drinking parties by Xenocrates in the Academy and also by Aristotle.

4.27 *ON THE COHABITATION OF MAN AND WOMAN*

F170 *R182C David,* Prolegomena to Philosophy *74.17–25*

[Aristotle] also wrote *On Economics*, in which he discussed the management of the household. In that work, he says that it is necessary that four things concur for the composition of the household: the relation of man to wife; the affection of the father for children; the fear of household slaves for the master; and that there is a balance of

income and expenditures. For both sorts of imbalance are shameful. For if income were found to be great and expenditures small, that would be something shameful; for such a person would be found to be a money-lover. But if income were found to be small and expenditures large, that would be something shameful; for such a person would be found to be wasteful.

F171 *R183 Clement of Alexandria,* Paedagogus *3.12.84*

I would advise married men never to kiss their wives at home in front of the household slaves. For Aristotle did not permit even smiling in front of slaves, still less that a wife appear to be embraced before their eyes.

5. Philosophy

5.29 *ON FORMS*

F172 *R185A Syrianus, On Aristotle's* Metaphysics *120.33–121.4 (1089^{a}9–15)*

That [Aristotle] has in fact nothing more than this to say against the theory of Forms is made clear both by the first book of this treatise and by the two books that treat things about the Forms. For it is pretty much by everywhere transferring the same arguments, sometimes chopping them up and subdividing them, sometimes announcing them more in a summary, that he attempts to refute the philosophers senior to him.

F173 *R186 Scholiast to Dionysius Thrax, 116.13–16 (Hilgard)*

One must see that the definitions are of universals and of things that always remain, as Aristotle also said in *On Forms*, which he composed against Plato's Forms. For while particulars all change and never stay the same, universals are unchangeable and eternal.

F174 *R187–188 Alexander of Aphrodisias, On Aristotle's* Metaphysics *79.3–88.2 (Golitsis)*

> 990^{b}11–13: According to the arguments from the sciences, there will be Forms of all things of which there are sciences.

As [Aristotle] says in the first book of *On Forms*, there are several ways in which [the Platonists] also used the sciences for establishing the Forms. These are the sorts of argument he is recalling here. |79.5|

If it is by referring back to something that is one and the same that every science produces its work and not to any of the particulars, for each science there would be something else beyond the perceptibles that is eternal and a paradigm of the things which come to be in accord with that science. A Form is a thing of this sort.

Further, the things that the sciences are of, these things *are*. But the sciences are of other things beyond the particulars (for these are unlimited in number and indefinite, while the sciences are of what is determinate). |79.10| Thus there are some things beyond the particulars, and these are the Forms.

Further, if medicine is the science not of *this* health, but of health unconditionally, there will be a health-itself; and if geometry is not a science of *this* equal thing or *this* commensurable thing, but of the unconditionally equal and the commensurable, there will be an equal-itself and a commensurable-itself. And these are the |79.15| Forms.

Such arguments, however, do not prove what they set out to prove, that there are Forms. But they do prove that there are some things beyond the particulars and perceptibles. But it is not at all the case that, if there are things beyond the particulars, these things are Forms. For beyond the particulars there are common things, and we say that the sciences are in fact of these.

Further, they show that there are also Forms of what falls under the crafts. For every craft also refers to the things that come about by means of it to some one thing, |79.20| and the things that the crafts are crafts of, these things *are*, and the crafts are of some other things beyond the particulars. And the latter [argument], in addition to the fact that it does not prove that there are Forms, seems to establish Forms of things of which they do not wish there to be Forms. For if, because medicine is not the science of this health but of health unconditionally, there is health-itself, |**80.1**| the same will also be the case for each of the crafts. For a craft is not of a particular or a this, but of that thing unconditionally that it is about—for example, carpentry is of bench unconditionally, not *this* bench, and of bed unconditionally, not *this* bed. And likewise, sculpture, painting, house-building, and each of the other crafts is related in the same way to the things that fall under them. |80.5| Therefore, there will be a Form of each of the things that fall under the crafts, which is precisely what they do not wish.

> 990^{b}13–14 And according to the *one over many* there will be Forms even of negations.

They also use the following sort of argument to establish the Forms. If each of the many men is a man and each of the [many] animals is an animal (and so on in the other cases), |80.10| and if for each of these it is not the case that something is predicated of itself, but there is something that is predicated of all of them that is not the same as any of them, this would be one among the things that are beyond the particular beings, separated from them, and eternal. For it is in every case predicated in the same way of all the things that keep changing numerically. And what is a one over many, separated from them, and eternal, it is a Form. Therefore, there are Forms. |80.15|

[Aristotle] says this argument establishes that there are Forms both of negations and of non-beings. For one and the same negation is predicated of many things, even of things that are not, and it is not the same as any of the things of which it is true. For non-man is predicated of horse, dog, and everything besides man, and because of

this it is a one over many, and not the same as any of the things of which it is predicated. |80.20| And further it always remains true of similar things in the same way. For non-musical is true in the same way of many things (for it is true of all the things that are not musical) and in the same way non-man |**81.1**| is true of the things that are not men. So there are also Forms of negations. But this is precisely what is absurd. For how could there be a Form of non-being? For if someone admits this, there will be one Form of things that are distinct in kind and different in every way, of line, for example, and of man; for these are all non-horses. Further, there will also be one Form of indeterminate and unlimited things, |81.5| and also of things of which one is primary and the other secondary; for man and animal are both not wood, but the former is primary and the latter secondary.[59] And of these they wish there to be neither Forms nor kinds. And it is clear that this argument also does not deduce that there are Forms; but it too tends to prove that what is predicated in common is something other than the particulars of which it is predicated. |81.10|

Further, the very people who wish to prove that what is predicated in common of many things is some one thing, and that this is a Form, establish this from negations. For if the one negating something of many things negates it by referring back to some one thing (for the one who says "a man is not white" and "a horse is not white" does not deny something special to them in each case, but making a reference back to some one thing, denies the same white |81.15| of all of them), then the one affirming the same thing of many things would not affirm something else of each, but there would be some one thing he would affirm—for example, "man"— with reference to one and the same thing; for as with negation, so with affirmation. Therefore, there is something other than being beyond the one in the perceptibles, which is the cause of the affirmation that is both true of many things and common; and this is the Form. This argument, then, [Aristotle] says, |81.20| produces Forms not only of things that are affirmed but also of things that are denied; for in both cases the "one" [referred to] is similar.

> $990^{b}14$–15: According to the argument that there is thinking of a thing that has passed away, there will be Forms of things that pass away; for there is an appearance of them.

The argument from thinking which establishes that there are Forms is like this: if, whenever |81.25| we think of man, footed, or animal, we are thinking of one of the things that *are* and not of any of the particulars (for the same thought remains even when these have passed away), it is clear that there is something beyond the particulars and perceptibles that we are thinking of whether or not they *are*; for surely we are not then thinking of something that is not. And this is a Form and Idea. [Aristotle] says, then, |**82.1**| that this argument establishes Forms of what is passing away, what has passed away, and, in general, of particulars and things capable of passing away, such as Socrates and Plato. For we also think of them and preserve an appearance of them

59. *EE* $1218^{a}1$–8, *Met.* $999^{a}6$–11.

even although they no longer are; for we preserve an appearance |82.5| even of what no longer exists. But we even think of what does not exist at all, like the Hippocentaur and Chimera. So this argument too does not deduce that there are Forms either.

> 990^{b}15–17: Further, of the more exact of the arguments, some produce Forms of relatives, of which we say there is not an intrinsic kind, |82.10| while others imply the third man.

The argument establishing Forms of relatives too is of the following sort. When the same thing is predicated of several things non-homonymously, but as indicating some one nature, it is true of them either by being what is signified by the predicate in the strict sense, |**83.1**| as when we say "man" of Socrates and Plato; or by their being likenesses of the true things, as when, in the case of paintings, we predicate man [of things in them] (for in these cases we indicate the likenesses of men by signifying the same nature in all of them); or because one of them is the paradigm and the others are likenesses, |83.5| as if we were to call both Socrates and his likenesses "men." But we predicate the equal-itself of the things here, although we predicate it homonymously of them. For neither does the same account apply to all of them, nor are we signifying the truly equal things; for the quantity of perceptible things moves and changes continuously and is not determinate, |83.10| nor does the exact account of the equal apply to any of the things here. But neither is the one a paradigm and the other a likeness, for the one is no more a paradigm or likeness of the other than vice versa. But even if one were to allow the likeness not to be homonymous with the paradigm, it always follows that these equal things are equal as likenesses of what is unconditionally and truly equal. But if this is so, there is an equal-itself and an unconditionally [equal], in relation to which the things here, as likenesses, come to be |83.15| and are said to be equal. And this is a Form, a paradigm and not a likeness of what comes to be in relation to it.

This one argument, the one establishing Forms of relatives too, seems to take hold more carefully, more exactly, and more immediately of the proof that there are Forms. For this argument seems not simply to prove that there is |83.20| something common beyond the particulars, like the arguments before it, but that there is some paradigm of the things here, which *is* in the strict sense. For this seems to be characteristic of the Forms most of all.

[Aristotle] says, then, that this argument establishes Forms of relatives too. At any rate, the present proof proceeded in the case of the equal, which is a relative. But [the Platonists] did not say that there are Forms of relatives, because the Forms intrinsically subsist by themselves, since they are some sort of substance, while |83.25| relatives have their being in their relation to each other. Further, if the equal is equal to an equal, there would be several Forms of the equal. For the equal-itself is equal to equal-itself. For, if it were not equal to anything, it would not be equal at all. Further, in accord with this same argument, there will also have to be Forms of unequal things. For of opposites alike, there will either be or there will not be Forms. And the unequal is agreed, |83.30| even by [the Platonists], to be present in several things.

Again, [Aristotle] shows common ground with [the Platonist's] belief, speaking with reference to it as if it were his own by saying "of which we say there is not an intrinsic kind," saying "kind" instead of "subsistent thing or nature," if indeed the relative is like an offshoot, as he says elsewhere.[60]

The argument introducing the third man is the following. [The Platonists] say that the things that are predicated in common of substances both are such things in the strict sense and are the things equal |**84.1**| and similar to them. And further, things that are similar to each other are similar to each other by sharing something that is the same, which is this in the strict sense. And this is the Form. But if this is the case and what is predicated in common of several things were not to be the same as any of those things of which it was predicated, there would be something else beyond it (for that is why man-itself is a kind, because while it is predicated of the particulars, |84.5| it was not the same as any of them). Therefore, there will be some third man beyond both the particulars (for example, Socrates and Plato) and beyond the Form, which is also one in number.

There was a certain argument stated by the sophists leading to the third man, as follows. If, when we say "man walks," we say neither that man, as a Form, walks |84.10| (for the Form is immovable) nor that any of the particulars do (for how could it be one whom we do not know? For we know that man walks, but we do not know of which of the particulars we speak), then we are saying that some other third man beyond these walks. Therefore, there will be a third man, of whom we predicated walking. Although this argument is sophistical, the people who separate the common thing from the particulars |84.15| (that is what those who posit Forms do) concede the foundations of this argument. Phaenias, in *Against Diodorus*, says that Polyxenus the sophist introduced the third man by saying, "If it is always the case that a man is by participating and sharing in the Form of man-itself, there must be some man who will have his being in relation to the Form. But it is neither the man-itself, which is the Form, that has his being by participating in the Form, nor is it some particular man. It remains that there is some |84.20| other third man who has his being in relation to the Form."

The third man is also proved in this way. If what is predicated truly of many things is something other than those things of which it is predicated, separated from them (for this is what those who posit the Forms think they are proving; for because of this, there is something, |84.25| man-itself, according to them, because man is predicated truly of many particular men and is distinct from each of them). But if this is the case, there will be a third man. For if the man that is predicated is distinct from the things of which it is predicated and subsists on its own, and man is predicated both of the particulars and of the Form, there will be some third man beyond the particular men |**85.1**| and beyond the Form. And in the same way there will also be a fourth man predicated of

60. *NE* 1096^{a}21.

the third, the Form, and the particular men, and similarly a fifth one, and so on without limit. But this argument is the same as the first. And this follows for them, since they posited that similar things are similar by participating in something that is the same; |85.5| for both the men and the Forms are similar. [Aristotle] refuted both these arguments, which seemed more exact, the one because it also establishes Forms of relatives, the other because it introduces the third man, and then increases the number of men without limit. And each of the other things of which [the Platonists] say there are Forms of will be increased in the same way.

But others, including Eudemus who clearly does so in *On Style*, have used the first explanation of the third man, |85.10| but he [Aristotle] uses the last one in the first book of *On Forms* and a little later on in the present treatise.

> 990^{b}17–19: And, in general, the arguments for the Forms do away with the things whose existence we, as people who speak of Forms, wish for more than the existence of the Forms.

What [the Platonists] wish for more, indeed most of all, is for the starting-points to exist; for the starting-points are for them |85.15| the starting-points of the Forms too. These starting-points are the one and the indefinite dyad, as [Aristotle] both said a little earlier and also recounted himself in *On the Good*. And these, according to [the Platonists], are also the starting-points of number. These arguments that establish the Forms, [Aristotle] says, do away with these starting-points. And if these are done away with, the things after the starting-points will also be done away with, |85.20| if indeed these come from the starting-points. So the Forms too are done away with. For if, in all cases, everything of which the common thing is predicated is separable and a Form, and if the dyad is predicated of the indefinite dyad, there would be something prior to it and a Form. Hence the indefinite dyad would no longer be a starting-point. But then neither would the dyad, in turn, be primary and a starting-point. For again, |85.25| number is predicated of it as a Form (for [the Platonists] posit that the Forms are numbers); so that number, since it is a sort of Form, would be prior to it. But if these things are so, number will be prior to the |**86.1**| indefinite dyad (which is for them a starting-point), not the dyad to number. And if this is so, the indefinite dyad would no longer be a starting-point, if indeed it is [what it is] by participation in something [else].

Further, the dyad is supposed to be the starting-point of number, but according to the argument just stated number becomes prior to it. But if number is in relation to something (for every number is a number *of* something), and |86.5| number is primary among the beings (if indeed it is prior to the dyad, which [the Platonists] supposed to be a starting-point), then, according to them, what is a relative would be prior to what is intrinsically. But this is absurd; for all relatives are secondary; for "relative" signifies a relation of an antecedently subsisting nature which is prior to the relation that coincidentally belongs to it. For the relative seems to be an offshoot, |86.10| as [Aristotle] said

in the *Ethics*.[61] But even if someone were to say that number is a quantity rather than a relative, it would follow that quantity is prior to substance.

Further, it follows that [the Platonists] must say that the relative is both a starting-point of and prior to what is intrinsically, inasmuch as the Form is, according to them, the starting-point of substances. But the being for a Form consists in the Form's being a paradigm, |86.15| and a paradigm is a relative; for a paradigm is a paradigm of something.

Further, if the being for the Forms consists in their being paradigms, the things that come to be in relation to them, of which these are the Forms, would be likenesses of them, and hence one might almost say that, according to [the Platonists], all things that are constituted in accord with nature become relatives. For they are all likenesses and paradigms.

Further, if the being |86.20| for the Forms consists in their being paradigms, and a paradigm is for the sake of what comes to be in relation to it, and what is because of something else is less estimable than it, then the Forms will be less estimable than what comes to be by relation to them.

> 990^{b}21–22: And all the other things that certain people, by following out the beliefs |**87.1**| held about the Forms, have accepted contrary to the starting-points.

The following are some of the arguments—in addition to the ones already mentioned—that, because of positing the Forms, do away with their starting-points. If what is predicated in common of certain things is their starting-point and |87.5| Form, and if a starting-point is predicated in common of the starting-points and element of the elements, there would be something prior to, and a starting-point of, the starting-points and the elements; hence they would not be starting-points or elements.

Further, a Form is not prior to a Form; for the Forms are all starting-points in the same way. But the one-itself and the dyad-itself are Forms in the same way, as also |87.10| are man-itself, horse-itself, and each of the other Forms. Therefore, one Form will not be prior to another, and so neither will it be a starting-point. Therefore, the one and the indefinite dyad are not starting-points.

Further, it is absurd for a Form to be endowed with form by a Form; for they are all Forms. But if the one and the indefinite dyad are starting-points, a Form will be endowed with form by a Form; for the dyad-itself is endowed with form by the one-itself, since [the Platonists] say that these are starting-points in this way: the one as form, |87.15| the dyad as matter. Therefore, they are not starting-points. But if they do not say that the indefinite dyad is a Form, first of all there will be something prior to it even though it is a starting-point. For the dyad-itself, by participating in which the [indefinite dyad] is itself a dyad, is prior to it, since it is not the dyad-itself. For it is by participation that the dyad will be predicated of it, since it is one of the dyads.

61. *NE* 1096^{a}21.

Further, if the Forms are simple, they would not derive from different starting-points; but the one and the indefinite dyad are different.

Further, the number |87.20| of dyads will be wondrous if the dyad-itself is one thing, the indefinite dyad another thing, the mathematical dyad another thing—which we use when counting and is not the same as either of these—and if yet beyond these, there is the dyad in things countable and perceptible. This is absurd. So it is clear that the consequences of the very things [the Platonists] posited about the Forms |**88.1**| can do away with the starting-points that are more precious to them than the Forms.

F175 *R189 Alexander of Aphrodisias, On Aristotle's* Metaphysics *97.27–98.24 (Golitsis)*

> [991ª8–10: Above all, one might go through the puzzles about what precisely the Forms contribute to perceptibles, either to those that are eternal or to those that come to be and pass away.]

[To prove] that the other things do not exist by mixing with the Forms, as Eudoxus and some others thought, [Aristotle] says it is easy to collect many impossible things that follow from this belief. And they would be these. If Forms are mixed with other things, first of all, they would be bodies; for mixture is characteristic of bodies. |**98.1**| Further, they will have contrarieties in relation to each other; for mixture is in accord with contrariety.

Further, the Form will be mixed either as a whole in each of the things in which it is mixed, or as a part. But if it is as a whole, what is one in number will be in many (for the Form is one in number), and if it in part, what participates in a part of man-itself, not |98.5| what participates in man-itself, will be a man.

Further, Forms would be divisible and partitionable, even though they are unaffected. Then they will be uniform, if indeed all things which have some part of a Form are similar to each other. But how is it possible for the forms to be uniform? For a part of the man cannot be a man in the way that a part of gold is gold.

Further, as in fact [Aristotle] himself says a little later on, in each thing there will not be one Form mixed in but many. |98.10| For if there is one Form of animal and a different one of man, and the man is both animal and man, it would participate in both Forms. And man-itself, the Form, would also participate in animal-itself, insofar as it is also animal. Hence Forms would no longer be simple but composed of many things, and some Forms would be primary and others secondary. But if [man-itself] |98.15| were not an animal, how would it not be absurd to say that a man is not an animal?

Further, if Forms are mixed with the things that are in relation to them, how would they still be paradigms, as [the Platonists] claim? For it is not in this way, by being mixed, that paradigms are causes of why likenesses are similar to them.

Further, they would also be done away with together with what they are in, when those things are done away with. And they would not even be intrinsically separable,

|98.20| but instead would be in the things that participate in them. And in addition to this, they will no longer even be immovable.

And there are other consequences of this belief that [Aristotle] proved to be absurd while examining it in the second book of *On Forms*. That is why he says here "for it is easy to collect many impossibilities against a belief of this sort," since they were deduced there.

5.30 *ON THE PYTHAGOREANS*

F176 *R191A Apollonius,* Historiae Mirabiles *6*

Again, Aristotle . . . said . . . that [Pythagoras] killed a venomous biting snake in Tyrrhenia by biting it himself, and that he foretold the coming civil war to the Pythagoreans; and that is why he departed to Metapontum unseen by anyone. While crossing the river Cosas with others, he heard a strong voice, a voice beyond a human one, "Welcome Pythagoras." Those present were terrified. He once appeared on the same day at the same time both in Croton and Metapontum. Once, while sitting in the theater, he stood up, so Aristotle says, and showed his uncovered golden thigh to those seated next to him.

F177 *R191B Aelian,* Varia Historia *2.26*

Aristotle says that Pythagoras was called the "Hyperborean Apollo" by the people of Croton.

F178 *R192 Iamblichus,* Life of Pythagoras *6.31*

Aristotle too recounts in *On the Pythagorean Philosophy* that the following division was guarded by the men in the greatest secrecy: of the rational animal, one part is god, another is human being, and another like Pythagoras.

F179 *R193 Apuleius,* On the God of Socrates *20.166–7*

If Aristotle is a sufficiently credible authority, as I judge him to be, the Pythagoreans used to be very surprised if someone denied he had ever seen a divine being.

F180 *R194A Aulus Gellius, 4.11–13*

Since these things are unexpected, I have written down Plutarch's precise words: "Aristotle says the Pythagoreans abstained from eating womb, heart, sea anemone, and certain other such things, but made use of others."

F181 *R194B Diogenes Laertius 8.1.19*

Aristotle says they sometimes also [abstain] from womb and red mullet.

F182 *R195 Diogenes Laertius 8.34*

Aristotle says in *On the* [*Pythagoreans*] that [Pythagoras] commanded abstaining from beans either because they are similar to sex organs or else because they are similar to the gates of Hades; for they alone are without joints. Or because they destroy, because they are similar to the nature of the universe, or because they are oligarchic; for they are used in appointment to office by lot. They do not pick up the things that have fallen, for the sake of not being accustomed to eating licentiously or because it is for someone's death.

F183 *R196 Porphyry,* Life of Pythagoras *41*

[Pythagoras] used to say some things in a figurative way and as one does in the mysteries, which Aristotle recorded at great length—for example, that he called the sea "the tears of Cronos," the constellations [of Ursa Major and Minor] "the hands of Rhea," the Pleiades "the lyre of the Muses," the planets "the dogs of Persephone"; while the sound that comes from bronze being struck is the "voice of one of the daimons caught inside the bronze."

F184 *R197 Porphyry,* Life of Pythagoras *42*

Another form of figurative speech is the following: "Do not step over the beam of the balance," meaning do not be greedy. "Do not stir a fire with a butcher's knife," meaning do not provoke someone swelled up and angry with sharp words. "Do not pluck a crown," that is, do not mistreat the laws; for these are the crowns of the city. Again, other things of the same sort: "Do not eat heart," that is, do not cause pain to oneself by grief. "Do not sit on the grain ration," which is do not live in idleness. And "do not turn back when on one's travels," that is, do not hold on to this life when dying. "Do not walk on the highway," by means of which he forbade one to follow the maxims of ordinary people, but to pursue those of the few well-educated people. And "do not receive swallows in one's house," that is, do not make babblers and people who cannot control their tongue your houseguests. "Add a burden to the burdened, and do not help take it off," by which he recommended doing nothing to further indolence, but to further virtue. "Do not wear images of gods on rings," that is, do not hold one's belief and speech about the gods readily accessible and in the open nor announce it to ordinary people. "Make libations to the gods with the 'ear' of the drinking cup." For from this he hinted that one is to honor and hymn the gods with music; for it goes through the ears.

F185 *R199 Theon of Smyrna,* On Mathematics Useful for Understanding Plato *22.5–9 (Hiller)*

Aristotle, in *The Pythagorean*, says that the one participates in the nature of both [even and odd]; for, when added to the even, it makes it odd and, when added to the odd, it makes it even, which would be impossible unless it participated in both natures. That is why the one is also called "the even-odd."

F186 *R200 Simplicius, On Aristotle's* De Caelo *386.9–23*

The Pythagoreans . . . call right, up, and forward "good" and said that left, down, and backward are "bad," as Aristotle himself recounted in his collection of the opinions of the Pythagoreans.

F187 *R201 Stobaeus,* Eclogs *1.18.1c*

In the first book of *On the Philosophy of Pythagoras*, Aristotle wrote that the heavens are one, drawing in time, breath, and void (which always delimits the place of each) from the unlimited.

F188 *R202 Alexander of Aphrodisias, On Aristotle's* Metaphysics *75.15–17 (990^{a}27–32) (Golitsis)*

In the second book *On the Belief of the Pythagoreans*, [Aristotle] recalls the order in the heaven, which the Pythagoreans made to be that of the numbers.

F189 *R203 Alexander of Aphrodisias, On Aristotle's* Metaphysics *38.8–41.2 (985^{b}26–32) (Golitsis)*

What similarities they said there are in the numbers in relation to the beings and the things that come to be, [Aristotle] made clear. For since they supposed that reciprocity and equality are special to justice, |38.10| and found these in numbers, because of this they said that justice is the first equal-times-equal number;[62] for they thought that in each case the first of the things having the same account is most of all that which is said to be. But some said that this number is four, since as the first square number, it is divided into equals and is itself equal (for it is two times two), while others said that it is nine, |38.15| which is the first square from an odd number, three, multiplied by itself. Again, they said that seven is the opportune moment; for it appears that the natural things have their complete opportune times, both of coming to be and of completion, in accord with sevens, as in the case of human beings. For a human being is born in the seventh month, grows teeth in the same number of months, reaches puberty at around |38.20| the second seven-year period, and grows a beard around the third. And the sun, since they say it seems to be the cause of opportune times, is seated at the seventh number, which they call "opportune time." For they say it holds the seventh position among the ten bodies moving around the center, that is, the hearth (for it moves after |**39.1**| the sphere of the fixed stars and the five spheres of the planets). After it, in eighth place, is the moon and the earth is ninth, after which is the anti-earth.

Nonetheless, since seven does not generate any of the numbers less than or equal to ten, nor was it generated from any of them, they also called it "Athena." For two generates four, three generates both nine |39.5| and six, four generates eight, and five generates ten, while four, six, eight, nine, and ten are all generated. But seven neither

62. I.e., square.

generates any number nor is it generated from any number. And Athena is also like this, since she is without mother and forever a maiden. They said that the number five is marriage, because marriage is the union of male and female, |39.10| and, according to them, the odd is male and the even is female, and five is the first number generated from the first even number (two) and the first odd number (three). For, as I said, the odd for them is male and the even female.

They said that the one is understanding and substance (for he[63] speaks of the "soul" as the understanding). Because the understanding is stable, alike on every side, and fitted for rule, |39.15| they say that is the unit and one, but also substance, because substance is primary. The number two is belief, because belief is changeable in both directions; but they also say that it is movement and addition.

Singling out similarities of this sort between things and numbers, they supposed that numbers were the starting-points of things, saying that all beings are composed of numbers. But seeing that the harmonies too are composed in accord with a certain number, |39.20| they said that numbers are also their starting-points; for the octave is in the ratio 2:1, the fifth in the ratio 3:2, and the fourth in the ratio 4:3. And they said that the whole of the heaven is composed in accord with a certain harmony (of which, in fact, the expression "the whole heaven is a number" is indicative), because it is composed of numbers and in accord with number and harmony. For the bodies that spatially move around the center |39.25| have their distances in a proportion, and some travel faster and others slower, making a sound during their movement—the slower ones making a low-pitched sound, the faster ones a high-pitched sound—and since these sounds are in proportion to the distances, they make the sound coming from them harmonious. |**40.1**| And since they say that number is the starting-point of this harmony, it makes perfect sense that they posited that it is also the starting-point of the heaven and the universe. For they said that the ratio of the distance of the sun from the earth or of the moon from the earth is 2:1, that of Venus is in ratio 3:1, that of Mercury is in the ratio 4:1, and they thought that in each of the other cases there is |40.5| some numerical ratio and that the movement of the heavens is harmonious. And they said that the ones moving the greatest distance move the most fast, those moving the smallest one move the slowest, while the intermediate ones move in proportion to the magnitude of their orbit.

From these similarities in the beings to the numbers, then, |40.10| they supposed that the things and the beings are composed of numbers—indeed, *are* certain numbers. And since they thought that the numbers are prior to the whole of nature and to the things that are by nature (for none of the beings could either be, or be at all known, separate from number, while the numbers can be known separate from everything else), they established the elements and starting-points of numbers as the starting-points of all beings. |40.15| These were, as was said,[64] even and odd. And of these, they thought

63. Probably, Aristotle; see *Met.* 985^{b}30.
64. Reading εἴρηται.

the odd limited and the even unlimited; of the numbers, they thought that unit is their starting-point, since it is composed of the even and odd. For the unit is at the same time even-odd, which he[65] used to prove through the unit's being capable of generating both odd and even number. For when added to even it gives birth to odd, |40.20| and when added to odd it gives birth to even.

"And all the concordances they found in the numbers and in their combinations in accord with the harmonies related to the affections and parts of the heaven"[66] taking these as evident in themselves, they proved the heavens are composed of numbers and in accord with harmony. But if any of the things appearing in the heavens seemed to be discordant with the sequence of the numbers, |40.25| they themselves added these and endeavored to fill in the gaps, with a view to the consistency of their entire system. To begin with, at any rate, thinking that ten is the complete number, but seeing nine moving spheres appearing (seven spheres of the planets, an eighth of the fixed stars, a ninth of the earth—for they thought, in fact, |40.30| that it too moves in a circle around the stationary hearth, which according to them is fire)—they themselves added a certain "anti-earth" in their doctrines, which they posited as moving in a direction opposite to that of the earth, and to be invisible to those on earth because of this. |**41.1**| Aristotle speaks about these things with greater exactness both in *De Caelo* and in *On the Beliefs of the Pythagoreans*.

F190 *R204 Simplicius, On Aristotle's* De Caelo, *511.25–31, 512.12–14 (293^{a}15–27)*

The Pythagoreans . . . say that the earth is not around the center, but that there is fire at the center of the universe. And they say that the anti-earth travels around the center, since it is also an earth, but is called "anti-earth" because it lies contrary to this earth. And "after the anti-earth, this earth too travels around the center, and after the earth the moon"; for this is how [Aristotle] himself recounts at the end of *On the Pythagoreans*. . . . That is why some of them call it, the fire, "the tower of Zeus," as he recounts in *On the Pythagoreans*, while others call it "Zeus' guard-post" (as he says in that work), others "Zeus' Throne" (as others say).

F191 *R205 Simplicius, On Aristotle's* De Caelo *392.16–32 (285^{b}8–27)*

How can [Aristotle] say that the Pythagoreans make us [to be situated] up and on the right, but make others [to be situated] there[67] down and on the left, if—as he himself recounts in the second book of the collection *On Pythagoreans*—they say that there is an upper and lower part of the whole heaven and that the lower is the right part of the heaven and the upper the left, and that we are in the lower part? But perhaps here "up" and "on the right" were said not in accord with his own opinion but in the Pythagorean

65. Probably, Pythagoras.
66. *Met*. 986^{a}3–6.
67. I.e., in the other hemisphere.

way. For they put up and forward together with the right, and down and backward together with the left. But Alexander thinks that the things said in the collection *On Pythagoreans* have rather been altered by someone and should say, "The upper part of the heaven is on the right, the lower part on the left, and we are in the upper part," not "in the lower," as was written. For in this way it will agree with what is said here, that in saying that we live in the lower [part] and because of this, on the left (since lower is put together with the left), we speak in the contrary way to what the Pythagoreans say, [that we live] up and on the right. And perhaps [Alexander's] alteration makes sense, since Aristotle knew that they put up together with right and down with left.

5.31 *EXCERPTS FROM THE TIMAEUS* AND *THE WORKS OF ARCHYTAS*

F192 *R206 Simplicius, On Aristotle's* De Caelo *296.16–18 (297^{b}17–21)*

When epitomizing Plato's *Timaeus*, [Aristotle] wrote, "He says that [the universe] is generated, for it is perceptible, and he is supposing that what is perceptible is generated, while the intelligible is ungenerated."

F193 *R207 Damascius,* Puzzles and Solutions *306*

Aristotle, in his work on Archytas, recounts that Pythagoras too called matter "other," because it is in flux and always becoming other [than it is].

5.32 *ON DEMOCRITUS*

F194 *R208 Simplicius, On Aristotle's* De Caelo *294.33–295.22 (297^{b}12–17)*

A few words added from Aristotle's *On Democritus* will clarify the thought of these men:[68] "Democritus thinks that the nature of eternal things consists of small substances unlimited in number, supposing something else as a place for these, unlimited in magnitude, and to this place he applied the names, 'void,' 'nothing,' 'unlimited,' and to each of the substances, 'this,' 'solid,' 'being.' He thinks that the substances are so small that they escape our perception, but all sorts of shapes and all sorts of figures and differences in size belong to them. Then, he thinks that from these, as from elements, the things visible to the eye and perceptible masses are generated and aggregated. And these factionalize and spatially move in the void because of their dissimilarity and also the other differences mentioned, and as they spatially move, they collide and intertwine in such a way that they are made to touch and be close to each other, yet this does not really generate any single nature whatever from these; for it is altogether simpleminded [to think] that two or more could ever become one. And the cause due to which the substances remain together with each other up to a certain point he attributed to the bodies fitting into each other and grasping on to each other; for some of them are

68. I.e., the Atomists.

uneven, others hooked, some concave, others convex, while others exhibit uncountably many other differences. He thinks, then, that they cling to each other until such a time as some stronger necessity arriving from the environment shakes and tears them away from each other." [Democritus] speaks of this generation and the disaggregation that is contrary to it not only in the case of animals, but also in that of plants and cosmoses and, in sum, in the case of all perceptible bodies.

6. Physics

6.33 *PHYSICAL PROBLEMS*

F195 *R211 Simplicius, On Aristotle's* De Caelo *505.23–25 (293ª4–11)*

Aristotle also makes this clear in the *Physical Problems* when he introduces further puzzles about the astronomers' hypotheses on the basis of the fact that the distances between the planets do not appear equal.

F196 *R213 Plutarch,* Questiones Coviviales *6.5*

However, pebbles and whetstones, I said, when we throw them into water, seem to cool and harden it. You will remember this was said by Aristotle. In the *Problems* he only says that this thing happens but let us make an attempt to state the cause.

F197 *R215 Plutarch,* Questiones Naturales *912A*

Why are trees and seeds naturally nourished more by rainwater than running water? . . . What Aristotle said is true, namely, that rainwater is fresh and young, while marsh-water is stale and old.

F198 *R229A Aulus Gellius 3.6*

By Heracles, a wondrous thing is said by Aristotle in the seventh book of *Problems* and Plutarch in the eight book of the *Symposiasts*! If, they say, you place large weights on the branches of a palm tree and press down hard and with force, so that it cannot bear the amount of weight, the palm does not give way downward, nor is made concave, but rises against the weight and pushes upward and becomes convex.

F199 *R232 Apollonius,* Historiae Mirabiles *51*

Aristotle said in the *Physical Problems* something worth knowing. He says that a human being who has eaten and drunk weighs the same as the one fasting. And he also attempts to give the cause of this occurrence.

F200 *R234 Apollonius,* Historiae Mirabiles *9*

Aristotle says in the *Physical Problems*: "Those who eat one meal a day have more spiteful characters than those who eat two."

6.34 *ON THE FLOODING OF THE NILE*

F201 *R246A Photius Bibliotheca 249, 441^{b}1–12*

Seasonal winds travel to the opposite locations. And when brought there [in the south], they collide with the high mountains of Ethiopia and when a lot comes together, rain is produced. And from these rains, the Nile overflows in the summer, flowing from summery and dry places. And Aristotle dealt with this issue. For he learned it from nature by taking action, thinking it fitting to send Alexander of Macedon to these places to ascertain the cause of the increase of the Nile by observation. That is why he says "this is no longer a problem, for it was seen clearly" that its increase derives from the rains.

7. Zoology

7.39 *PERTAINING TO ANIMALS*

F202 *R284 Strabo 15.22.695*

Aristotle recounts cases of septuplets being born and calls the Nile "prolific" and "nourishing," because of the moderate boiling due to sunny days, which leaves behind the nourishment itself and burns up the residue.

F203 *R286 Pliny,* Natural History *11.273*

I truly marvel that Aristotle not only believed that there are some signs of longevity in bodies themselves, but even proclaimed it. . . . As signs of a short life he posits: few teeth, extra-long fingers, dull complexion, and many non-continuous lines in the palm. On the other hand, as signs of long life: sloping shoulders, one or two long lines in the palms, more than thirty-two teeth, and large ears.

F204 *R288 Apollonius,* Historiae Mirabiles *27*

Aristotle, in *Pertaining to Animals* (for there are two treatises by him, *On Animals* and *Pertaining to Animals*) says: "Head lice do not perish during long illnesses, but when those suffering from them are about to die, they are found on pillows, having abandoned the head."

F205 *R297 Athenaeus 286F*

In the work titled *Pertaining to Animals* or *On Fishes*, Aristotle says "those with markings on the back are called '*boax*'[69] . . . , while those marked with oblique lines are called 'coly-mackerels'."[70]

7.42 *MEDICAL ISSUES*

F206 *R373 Galen, On Hippocrates'* On Human Nature *(15.25–26)*

If you want to inquire into the beliefs of the ancient doctors, you can read the books in the medical collection ascribed to Aristotle, but agreed to have been written by Meno, who was his student. That is why some even call these books *Menôneia*. It is clear that this Meno, carefully searching out the books of those old doctors that were still extant, collected their beliefs from there.

7.43 *OPTICS*

F207 *R380 Vita Aristotelis Marciana 170–175 (Gigon)*

In mathematics, he put forward that the cone of sight is at an acute angle, because sight projects further than the magnitude that it sees. For also because of this none of the things seen is seen as a whole at the same time, and hence the axis is longer than its base and the cone is acute angled.

8. History

8.44 *CONSTITUTIONS*

F208 *Cicero,* On Ends *5.11*

From Aristotle we know the customs, institutions, and education of all cities, not only the Greek but also barbarian ones, and from Theophrastus we know the laws.

F209 *R472 Athenaeus 272D*

In the *Aeginian Constitution*, Aristotle says that they had 470,000 slaves.

F210 *R473 Strabo 7.7.2*

In the *Acarnanian Constitution*, Aristotle says that one part of [Acarnania] was held by the Kouretes tribe, another further west by the Leleges tribe, next by the Teleboae. But in the *Aetolian Constitution*, he calls the present-day Locrians "Leleges" and says that they also inhabit Boeotia. He says the same thing in the *Opuntian Constitution* and

69. *HA* 610^{b}4.
70. *HA* 598^{a}24.

the *Megarian Constitution.* In the *Leucadian Constitution*, he also calls a certain Lelex "native." Teleboa, his maternal grandson, had twenty-two children, some of whom inhabited Leucas.

F211 *R483 Harpocration, Entry* [The Council of the] Ten Thousand at Megalopolis [in Arcadia]

The council is shared among all the Arcadians, which historians often mention. And Aristotle discussed them at the beginning of the book, the shared *Arcadian Constitution*.

F212 *R485 Plutarch,* Theseus *16*

Aristotle, in the *Bottiaean Constitution*, is clear that he does not think that the children were killed by Minos,[71] but grew old in Crete as serfs.

F213 *R501A Scholiast on Dionysius Thrax, p. 183.1–5 (Hilgard)*

Some, including Ephorus, say that Cadmus was the second inventor of the alphabet. And some, such as Herodotus in the *Histories* and Aristotle, say that he transmitted the invention of the Phoenicians to us. For they say that, while the Phoenicians invented the alphabet, Cadmus brought it to Greece.

F214 *R504 Etymologia Magna p. 144, 22, Entry* Arkeisios

Aristotle, in the *Ithacan Constitution*, says that when Cephalus settled in the Cephallenian islands, which were named after him, since he was childless for a long time, and on asking the god, he was ordered to mate with whatever female he encountered. He arrived in the country and, when he encountered a she-bear, mated with it in accord with the oracle. When it was impregnated, it transformed into a woman and bore a child, "Arkeisios" from *arktos* ("bear").

F215 *R544B Scholiast on Euripides'* Andromache *446 (p. 165 t. IV Dindorf)*

"O most hateful of mortals to all peoples (shamefully greedy inhabitants of Sparta),". . . and next he says that they are vicious in other ways but especially in their love of money. Aristotle also recounts this in the *Spartan Constitution* and adds the poem spontaneously produced by the god: "Money-loving will destroy Sparta, nothing else."

F216 *R549A Athenaeus 576A–B*

Aristotle too recounts in the *Massalian Constitution* that something similar happened, writing as follows: "Phocaean merchants from Ionia founded Massalia. And Euxenus the Phocaean was a guest-friend of Nanos, the king—this was his name. This Nanos, when he was having his daughter's wedding, met Euxenus by luck and invited him to the feast. The wedding happened in the following manner: after the meal, when the bride entered, she had to give a mixed bowl [of wine] to whichever of the suitors

71. *GA* 724^{b}2.

present she wished, and whomever she gave it to had to be her husband. And when the bride entered, whether by luck or due to some other cause, she gave it to Euxenus. The bride's name was 'Petta.' When this occurred, the father consented, thinking that it was in accord with the god that she gave it, Euxenus took her as his wife and moved in with her, changing her name to 'Aristoxene.' And there is still a clan in Massilia that stems from her, called 'Protiadae,' for Protos was the son of Euxenus and Aristoxene."

F217 *R600 Pliny,* Natural History *7.207*

Aristotle says that the Carthaginians were the first to build the quadrireme, a ship with four rows of oars.

8.46 *CLAIMS*

F218 *R614 Pseudo-Ammonius,* On Similar and Different Expressions *334*

Aristotle recounts the following in his *Claims of Cities*: "Alexander the Molossian, during the same time that the Tarantines sent him to wage war against the barbarians, sailed with fifteen ships, and numerous vessels for cavalry and troops."

8.47 *PYTHIAN VICTORS*

F219 *R615 Plutarch,* Solon *83F*

The Amphictyons were persuaded by [Solon] to go to war, as many testify, including Aristotle in the *Register of Pythian Victors*, who ascribes the proposal to Solon.

8.48 *CATALOGS OF DRAMAS*

F220 *R624 Harpocration, Entry* Catalog of Drama

They specifically call "dramatists" the poets who write dithyrambs, comedies, or tragedies. Antiphon, in his work *On the Chorus Dancer*, says, "They elected Pantacles dramatist by lot." And, in fact, that Pantacles was a poet has been made clear by Aristotle in the *Catalogs of Dramas*.

8.49 *HISTORICAL NOTES*

F221 *R635 Plot of Euripides,* Medea *(p. 143)*

[Euripides] seems to have presented the play as his own after having adapted it from Neophron, as (argued by) Dicaearchus in *The Life of Greece* and Aristotle in his *Notes*.

8.50 *PEPLOS*

F222 *R637 Scholiast to Aristides,* Panathenaicus *(p. 323 Dindorf)*

The order of gatherings, according to Aristotle: First, the Eleusinian because of Demeter's harvest. Second, the Panathenaea for Aster, the giant killed by Athena. Third, the one in Argos that Danaus instituted because of the wedding of his daughters. Fourth, the one instituted in Arcadia by Lycaon called the "Lycaea." Fifth, the one in Iolcus begun by Acastus for his father Pelias. Sixth, the one on the Isthmus that Sisyphus legislated for Melicertes. Seventh, the Olympian that Heracles legislated for Pelops. Eighth, the one in Nemea, which the Seven Against Thebes instituted for Archemorus. Ninth is the Trojan, which Achilles made for Patroklos. Tenth the Pythian, which the Amphictyons founded for the death of Pytho. This is the order of ancient and modern gatherings that Aristotle, the composer of the *Peploi*, wrote out.

9. Speeches and Letters

9.51 *DEFENSE AGAINST EURYMEDON'S CHARGE OF IMPIETY*

F223 *R645 Athenaeus 697A*

Aristotle himself, in his *Defense against the Charge of Impiety*, if the speech is not spurious, says, "For I would never have proposed to sacrifice to Hermias as an immortal, but prepared a memorial to him as a mortal and, wishing to immortalize his nature adorned it with funerary honors."

9.52 *ON KINGSHIP*

F224 *R646 Vita Aristotelis Marciana 94–96 (Gigon)*

In order to be a benefactor of all human beings, Aristotle wrote for Alexander a book *On Kingship*, in which he taught how one must rule as king.

F225 *R647 Themistius,* Orations *8.107CD*

It is right to admire Aristotle, because by altering Plato's words a little bit, he made his account truer, not saying that it is necessary for a king to philosophize, but even a hindrance. Instead, he should be ready to obey and inclined to give ear to true philosophers; for then he would fill his rule with good works, not good words.

9.56 *LETTERS*

F226 *R652A Vita Aristotelis Mariciana 34–40 (Gigon)*

When [Aristotle] turned seventeen, he received an oracle from the Pythian god to practice philosophy in Athens. There he studied with Socrates and stayed with him almost

until the latter's death; after him, he studied with Plato and also stayed with him until his death, for about twenty years, as he himself says in a letter to Philip.

F227 *R654 Vita Aristotelis Marciana 126–128 (Gigon)*

Aristotle appears in his letters to admire Plato and as introducing those in Plato's family to the kings.

F228 *R655 Vita Aristotelis Marciana 75–84, 90–93 (Gigon)*

The philosopher, since he was such an important part of the kingdom,[72] used his power as an instrument of benefaction, performing good services for each individual, for entire cities, and for everyone at the same time. For how much he was a benefactor of particular kings is made clear by the letters written by him to the kings about certain matters. And how much he was a benefactor of entire cities is made clear by Stagira and Eresus (the homeland of his students Theophrastus and Phaenias). For when his native Stagira was razed to the ground by Philip, he persuaded Alexander to found it a second time and give it new lands. . . . And when Eresus was about to be besieged by Philip, he persuaded him to leave it alone. And he provided much benefaction to the Athenians in his letters to Philip.

F229 *R656 Demetrius,* On Style *233*

Aristotle, however, also uses demonstrations suited to letters. For example, when he wishes to teach that it is necessary to be a benefactor of both large cities and small ones, he says: "For the gods in both are equal, so that, since the Graces are goddesses, equal grace will be held in store for you in both." For what is demonstrated and the demonstration itself are both suitable for letters.

F230 *R657 Dio Chrysostom 47.9–11*

I sometimes used to congratulate Aristotle, who was a Stagirite (Stagira was a village in Olynthia). When Olynthus was taken, Aristotle, through his association with Alexander and Philip, managed to bring about the re-founding of the village. I used to say that he was the only one to experience such good luck, that is, to be the founder of his own fatherland. But lately I chanced upon a letter in which he is repenting and lamenting his actions, saying that "some of them[73] are killing the king and governors as they arrive, so that nothing good came of it and the city was not completely founded." . . . Aristotle writes in the letter how he lost heart in the business; he says, in fact, "I throw up my hands. And you must think that I throw up my own hands and if there are others, them too."[74]

72. Reading βασιλείας.
73. I.e., the people in Olynthus.
74. Reading: φησὶ γὰρ αἴρειν τοὺς δακτύλους· κἀμὲ νομίζετε καὶ τοὺς ἰδίους δακτύλους αἴρειν καὶ εἴ τινές εἰσιν ἕτεροι.

F231 *R659 Aelian,* Varia Historia *12.54*

Aristotle, wishing to calm Alexander when he was angry and stop him from being violent toward so many people, wrote the following to him: "Spirit and anger are directed not against lesser people but against greater people; and no one is equal to you."

F232 *R662 Aulus Gellius 20.5.11–12*

Greetings King Alexander from Aristotle. You wrote to me about the esoteric writings, thinking it necessary to keep them secret. Know, then, now that they consist of both published and unpublished accounts; for they are intelligible only to those who hear our lectures. Farewell.

F233 *R663 Aristocles, Fr. 2 (Heiland) from Eusebius,* Preparation for the Gospel *15.2.14*

As regards his marriage to Pythia, [Aristotle] himself has given a sufficient defense in the letters to Antipater. For when Hermias died, he married her on account of goodwill toward him: she was, at all events, temperate and good, but had bad luck because of the disasters that befell her brother.

F234 *R664A Plutarch,* On Tranquility of Mind *472E–F*

Aristotle, writing to Antipater, says: "It is not only fitting for Alexander to be proud because he rules over many people, but it is no less fitting for those who hold about the gods the beliefs they should."

F235 *R665 Demetrius,* On Style *225*

Who would speak to a friend in the way that Aristotle, when he is writing to Antipater on behalf of an aged exile? He says: "If this man goes as an exile to every land so as never to return, it is clear that there can certainly be no reproach for those who wish to descend to Hades." For someone speaking in this way is more like someone showing off than someone just chatting.

F236 *R666 Aelian,* Varia Historia *14.1*

Aristotle, son of Nicomachus, . . . when someone took away the honors voted for him at Delphi, wrote a letter to Antipater about this. He said: "As regards the honors voted for me at Delphi that have been taken away, my present stance is that neither they concern me greatly nor do they not concern me at all."

F237 *R667 Vita Aristotelis Marciana 184–191 (Gigon)*

When the Athenians rose up against him, [Aristotle] escaped to Chalcis, suggesting as an explanation, "I will not permit Athens to err twice against philosophy." But since the duties are not the same for a citizen and for a foreigner in the city of Athens, in his letter

to Antipater he writes: "It is difficult to spend time in Athens. For the pear ripens on the pear tree, the fig (*sukon*) on the fig tree,"[75] hinting at the succession of sycophants.

F238 *R668 Demetrius,* On Style *144*

Grace comes about from everyday words, as when Aristotle says, "The more of a loner I am, the more a lover of stories I become," and from neologisms, as when he says in the same passage, "The more I am a selfer and a loner, the more a lover of stories I become." For while "loner" is a term of a rather everyday character, "selfer" is a neologism of his own.

F239 *R669A Demetrius,* On Style *29*

However, similarities of endings can sometimes be useful, as when Aristotle says: "I came from Athens to Stagira because of a king so great, from Stagira to Athens because of a winter so great."

F240 *R670 Demetrius,* On Style *230–231*

Aristotle, who seems to have succeeded most of all with the style suited to letters, says: "I do not write this to you, for it is not suited to letters." For if someone were to write sophisms or natural science in a letter, while he would be writing, he would nonetheless not be writing a letter. For a letter professes to be courteous, concise, setting out a simple subject matter in simple words.

10. Poems

F241 *R673 Olympiodorus, On Plato's* Gorgias *41.9.13–26*

That Aristotle revered [Plato] as his teacher is clear from the fact that he wrote an entire encomium [to him]. . . . But not only did he praise him by composing an encomium, but also in the elegy for Eudemus, while complimenting the latter he also praises Plato, writing as follows:

> Entering the famous land of Cecropia
> He piously dedicated an altar to holy friendship
> For a man whom it is not right for bad men even to praise.
> A man, who alone, or first among mortals brilliantly displayed
> By his own life as well as by his methods of argument
> That it is at the same time that a man becomes good and happy.
> But now no one can grasp this anymore.

75. *Odyssey* 7.120–121.

F242 *R675 Diogenes Laertius 5.7–8 = Athenaeus 696B–E, Didymus,* On Demosthenes *col. 6 (Page)*

O virtue, much labored for by mortal kind,
The noblest spoil in life,
For your beautiful shape, maiden,
Even to die is an enviable fate in Greece,
And to suffer pains, raging and unceasing.
Such is what you cast into a heart,
An undying fruit, greater than gold,
Than ancestors, than soft-glittering sleep.

For your sake Zeus' Heracles and Leda's sons
Endured much in their deeds
Hunting after your power;
In longing for you Achilles and Ajax entered the house of Hades;
For the sake of your dear form, Atarneus' nursling[76]
Forsook the rays of the sun.

That is surely why he will be sung of for his deeds
And why the Muses will exalt him into immortality,
The daughters of Memory, exalting the awe of Zeus, god of guest-friends and
The last honors of steady friendship.

11. Will

F243 **Diogenes Laertius 5.11–16 (Dorandi)*

May all be well; but if anything should happen, Aristotle has made the following provisions:

Antipater is to be the executor of all matters and in perpetuity. |**12**| Until Nicanor arrives, Aristomenes, Timarchus, Hipparchus, Dioteles, and Theophrastus (if he wishes to and is able) are to take care of the children, Herpyllis, and the property.

When my daughter comes of age, she is to be given in marriage to Nicanor. But if anything should happen to her before marrying (may it not, nor will it) or when she has married but has not yet had children, Nicanor is to have full authority in matters concerning the boy[77] and concerning all other matters, to manage in a manner worthy of himself and of us. Nicanor is also to take care of both my daughter[78] and my son Nicomachus in whatever way he thinks worthy for them, as if he were their father or brother.

76. I.e., Hermias. See F223.
77. I.e., Nicomachus.
78. Whom other sources say was called "Pythias," like her mother.

If anything should happen to Nicanor beforehand (may it not), either before taking the girl in marriage or after he has taken her but before there are children, let whatever provisions he may have made be valid. If Theophrastus wishes to be with the girl, it is to be just as with Nicanor. |**13**| If not, the executors, in consultation with Antipater, are to manage the affairs of the girl and the boy as seems best to them.

The executors and Nicanor, in memory of me and of Herpyllis, because she was devoted to me, are to take care of all other matters related to her, and, if she wishes to take another husband, they are to see to it that she is not given to anyone unworthy of us. In addition to what was given to her before, they are to give her a talent of silver from the estate and three female slaves, whichever ones she wishes, as well as the maid she presently has, and the slave from Pyrrha. |**14**| If she wishes to live in Chalcis, she may have the guesthouse by the garden, if in Stagira, my father's house. Whichever of these she wishes, the executors are to make those preparations that seem best to them and sufficient to Herpyllis.

Nicanor is also to take care of the young boy Murmex,[79] so that he is conveyed in a way worthy of us to his own relatives, with those belongings of his which we received. Ambarkis is to be freed and given, when my daughter marries, five hundred drachmas and the young female slave she has. Thale, in addition to the maid she has (the one who was bought), is to be given a thousand drachmas and a maid. |**15**| And for Simon, apart from the money given to him previously for the slave, either another slave is to be bought or additional money is to be given to him. Tacho is to be freed, when my daughter marries, as well as Philon, Olympius, and his child. Do not sell any of the slaves who served me, but continue to employ them. And when they come of age, set them free if they deserve it.

The executors are to take care too that the busts commissioned from Gryllion are set up when they are finished: that of Nicanor, that of Proxenus (which I had in mind to commission), and that of Nicanor's mother; that of Arimnestus, already completed, they are to set up as a memorial to him, since he died childless; |**16**| that of my mother they are to consecrate to Demeter at Nemea, or wherever seems appropriate. Wherever they make my grave, there they are to collect and place the bones of Pythia, as she herself instructed. Upon Nicanor's safe return, in fulfillment of the prayer I have offered on his behalf, they are to set up in Stagira stone statues, four cubits high, to Zeus the Savior and to Athena the Savior.

79. Otherwise unknown. The rest are apparently Aristotle's slaves.

CATALOGS OF ARISTOTLE'S WRITINGS

*Diogenes Laertius 5.22–27**

[Aristotle] wrote an altogether enormous number of books, which I have thought it appropriate to append because of the man's excellence as regards all his accounts:—

1. *On Justice*, 4 books **|22|**
2. *On Poets*, 3 books
3. *On Philosophy*, 3 books
4. *On the Politician*, 2 books
5. *On Rhetoric*, or *Grylus*, 1 book
6. *Nerinthus*, 1 book
7. *Sophist*, 1 book
8. *Menexenus*, 1 book
9. *On Love*, 1 book
10. *Symposium*, 1 book
11. *On Wealth*, 1 book
12. *Protrepticus*, 1 book
13. *On the Soul*, 1 book
14. *On Prayer*, 1 book
15. *On Good Breeding*, 1 book
16. *On Pleasure*, 1 book
17. *Alexander*, or *In Defense of Colonists*, 1 book
18. *On Kingship*, 1 book
19. *On Education*, 1 book
20. *On the Good*, 3 books
21. *Excerpts from Plato's* Laws, 3 books
22. *Excerpts from Plato's* Republic, 2 books
23. *Economics*, 1 book
24. *On Friendship*, 1 book
25. *On Being Affected or Having Been Affected*, 1 book
26. *On Sciences*, 1 book
27. *On Contentious Arguments*, 2 books
28. *Resolutions of Contentious Arguments*, 4 books
29. *Sophistical Divisions*, 4 books
30. *On Contraries*, 1 book
31. *On Forms and Kinds*, 1 book

* Translated by C. D. C. Reeve. Text: T. Dorandi, *Diogenes Laertius: Lives of Eminent Philosophers* (Cambridge, 2013).

32. *On [Platonic] Forms*, 1 book
33. *Notes on Dialectical Arguments*, 3 books **|23|**
34. *Propositions on Virtue*, 3 books
35. *Objections*, 1 book
36. *On What Is Said of Things in Many Ways or By Addition*, 1 book
37. *On Feelings* or *On Anger*, 1 book
38. *Ethics*, 5 books
39. *On Elements*, 3 books
40. *On Scientific Knowledge*, 1 book
41. *On Starting-Point*, 1 book
42. *Divisions*, 17 books
43. *Division*, 1 book[1]
44. *On Question and Answer*, 2 books
45. *Propositions on Movement*, 1 book
46. *Contentious Propositions*, 1 book
47. *Deductions*, 1 book
48. *Prior Analytics*, 9 books
49. *Great Posterior Analytics*, 2 books
50. *On Problems*, 1 book
51. *Methodics*, 8 books
52. *On the Better*, 1 book
53. *On the Form*, 1 book
54. *Definitions Pre-Topics*, 1 book
55. *Topics*, 7 books
56. *Deductions*, 2 books
57. *Deduction and Definitions*, 1 book
58. *On the Desirable and the Coincidental*, 1 book |**24**|
59. *The Pre-Topics*, 1 book
60. *Topics against Definitions*, 2 books
61. *Affections*, 1 book
62. *Division*, 1 book
63. *Mathematics*, 1 book
64. *Definitions*, 13 books
65. *Dialectical Deductions*, 2 books
66. *Propositions on Pleasure*, 1 book
67. *On the Voluntary*, 1 book
68. *On the Noble*, 1 book
69. *Theses for Dialectical Deductions*, 25 books
70. *Theses on Love*, 4 books
71. *Theses on Friendship*, 2 books
72. *Theses on the Soul*, 1 book
73. *Politics*, 2 books
74. *Lectures on Politics* (like those of Theophrastus), 8 books

1. In 42, the title is *diairesis*, which refers to the process of division; in 43 it is *diairetikon*, which refers to each of the divisions resulting from that process.

75. *On Just Actions*, 2 books
76. *Collection of Crafts*, 2 books
77. *Craft of Rhetoric*, 2 books
78. *Craft*, 1 book
79. *Craft* (another work), 2 books
80. *Methodics*, 1 book
81. *Collection of the "Craft" of Theodectes*, 1 book
82. *Study on the Craft of Poetry*, 2 books
83. *Rhetorical Enthymemes*, 1 book
84. *On Magnitude*, 1 book
85. *Divisions of Enthymemes*, 1 book
86. *On Style*, 2 books
87. *On Advice*, 1 book |**25**|
88. *Collection*, 2 books
89. *On Nature*, 3 books
90. *Nature*, 1 book
91. *On the Philosophy of Archytas*, 3 books
92. *On the Philosophy of Speusippus and Xenocrates*, 1 book
93. *Excerpts from the Timaeus and from the Works of Archytas*, 1 book
94. *Against the Doctrines of Melissus*, 1 book
95. *Against the Doctrines of Alcmaeon*, 1 book
96. *Against the Pythagoreans*, 1 book
97. *Against the Doctrines of Gorgias*, 1 book
98. *Against the Doctrines of Xenophanes*, 1 book
99. *Against the Doctrines of Zeno*, 1 book
100. *On the Pythagoreans*, 1 book
101. *On Animals*, 9 books
102. *Dissections*, 7 books
103. *Selection of Dissections*, 1 book
104. *On Compound Animals*, 1 book
105. *On Mythological Animals*, 1 book
106. *On Sterility*, 1 book
107. *On Plants*, 2 books
108. *Physiognomics*, 1 book
109. *Medicine*, 2 books
110. *On the Unit*, 1 book
111. *Signs of Storms*, 1 book
112. *Astronomy*, 1 book |**26**|
113. *Optics*, 1 book
114. *On Movement*, 1 book
115. *On Music*, 1 book
116. *Memory*, 1 book
117. *Homeric Problems*, 6 books
118. *Poetics*, 1 book
119. *Physics* (alphabetically ordered), 38 books

120. *Problems*, 2 books
121. *Problems in Circulation*, 2 books
122. *Mechanics*, 1 book
123. *Problems from Democritus*, 2 books
124. *On the Magnet*, 1 book
125. *Conjunctions of Stars*, 1 book
126. *Miscellaneous*, 12 books
127. *Examinations Arranged by Kind*, 14 books
128. *Claims*, 1 book
129. *Olympic Victors*, 1 book
130. *Pythian Victors in Music*, 1 book
131. *On Pytho*, 1 book
132. *Pythian Victors*, 1 book
133. *Victories at the Dionysia*, 1 book

17. Translated (from the French) by Pavlos Kontos. Text (Arabic with French translation): Marwan Rashed, *Ptolémée "Al-Gharîb," Épître* à *Gallus sur la Vie, le Testament et les Écrits d'Aristote* (Paris, 2021). The translation employs the numbering of Ptolémée, *Ad Gallum*, in which not all entries have a separate number, but draws also on the other two versions of the catalog that Rashed prints, especially that of Ibn al-Qifti, which often includes the Greek title of the treatise listed. Correlations with DL are sometimes approximate.

ANNOTATED GLOSSARY OF TERMS*

Abduction (*apagôgê*): *Apagôgê* is defined in *APr*. 2.25 as a process of leading an argument away from one problem to another that is more easily solved. The term is also applied to indirect proof, where a conclusion is reached by deriving an impossibility or falsehood, as in reduction to a contradiction (*reductio ad absurdum*).

Abstraction (*aphairesis*): A process of mentally removing or stripping away affections or attributes (*Ph*. 193^{b}34), in order to study what remains. This happens correctly in mathematics (*Met*. 1061^{a}28–35), and in primary philosophy (1004^{b}10–17), but often incorrectly in natural science (1036^{b}21–32, *PA* 641^{b}10–12).

Acceptable, Reputable (*endoxos*): (1) When applied to a belief or the like, *endoxos* is "acceptable" and its antonyms, (usually) *paradoxos* and (sometimes) *adoxos* (*SE* 173^{a}26), as "unacceptable." (2) When applied to people, qualities, or the like, it is "reputable," as is *eudokimôn*, and its antonyms, *adoxôn* (*Rh*. 1372^{b}22) and (sometimes) *adoxos*, as "disreputable" (1384^{b}31).

Account: See *Logos*

Action (*praxis*)

The noun *praxis* (plural: *praxeis*; verb: *prattein*) is used in a broad sense to refer to any intentional action, including one performed by a child or wild beast; in a narrower one, it refers exclusively to what results from deliberation and deliberate choice, of which neither beasts nor children are capable (*NE* 1111^{a}25–26, ^{b}8–9, *EE* 1224^{a}30–32).

What distinguishes a *praxis* from a *poiêsis* ("production"), with which it is often contrasted, is that the latter is always performed for the sake of some further end, while a *praxis* need not be (*NE* 1139^{a}35–^{b}5). The distinction between a "complete" *praxis* (*Met*. 1048^{b}21–22) and a *poiêsis* is thus a special case of a more general distinction that Aristotle draws at *Met*. 1048^{b}18–35 between an *energeia* ("activity") and a *kinêsis* ("movement").

Expressed linguistically, the contrast is one of aspect rather than tense. Roughly speaking, a verb whose present tense has imperfective meaning designates a *kinêsis*, while one whose present tense has perfective meaning designates an *energeia*. The distinction itself is ontological, however, not linguistic: an *energeia* and a *kinêsis* are sorts of beings, not sorts of verbs. A *poiêsis* or *kinêsis* is something that takes time to complete and—like the time it takes—is indefinitely divisible (*Ph*. 207^{b}21–25, *Met*. 1020^{a}26–32). It has a definite termination point or limit, before which it is

* Prepared by C. D. C. Reeve.

incomplete and after which it cannot continue (*NE* 1174^{a}19–21). An *energeia* does not take time to complete, and so does not really occur "in a temporal interval" (*Ph.* 262^{b}20–21) but is temporally point-like (*NE* 1174^{b}12–13). Having no definite termination, while it may stop, it need never finish (*Met.* 1048^{b}25–27).

The paradigm cases of actions, as we understand them, are temporally extended bodily movements appropriately related to (perhaps by being caused by) beliefs, desires, and intentions. Nonetheless, there is one sort of action that *praxeis* seem to resemble quite closely, namely, so-called basic actions—actions we do directly without having to do anything else. This is especially true, if, as Aristotle himself seems to believe, these are thought to be mental acts of willing, deciding, or trying: "strictly speaking, the ones who above all do actions, even external actions, are the architectonic craftsmen who do them by means of their thoughts" (*Pol.* 1325^{b}21–23). Like *praxeis*, in any case, these sorts of mental actions are not bodily movements and do not seem to take time to perform. Moreover, just as we do not perform basic actions by doing something else first, the same seems true of *praxeis*, so that a human being is "a starting-point or begetter of his *praxeis* as of his children" (*NE* 1113^{b}18–19; also 1139^{b}5). As in the case of productions, where the form in a craftsman's soul is transmitted to the matter via the movements of his hands and instruments (*GA* 730^{b}12–23), so the results of such *praxeis* may be transmitted via bodily movements to other things that are capable of being changed by them. These results, and the bodily movements involved in bringing them about, are what we think of as paradigm actions.

When a group of dramatic actions have a plot-structure (*muthos*) of the sort a good tragedy possesses, Aristotle says that they constitute "one unified action that is whole and complete, having a starting-point, middle points, and end" (*Po.* 1459^{a}19–20). By being enactments of the real-life equivalent of the relevant sort of plot or plan, therefore, the same should also be true of a group of non-dramatic actions. As a group of actors can set out to perform *Oedipus Tyrannus*, so a single agent can set out to enact a unified plan of action, which involves doing many different things in some sort of sequence. The complex action that fits this plan may be what constitutes his acting well—his *eupraxia*.

To understand why the agent is doing any of the things specified by the plan, we will typically need to see it in relation to the plan as a whole. For many of these, taken individually, might not be ends or goods choiceworthy for their own sakes: some might be otherwise valueless means to ends, some might be productions of needed equipment, some might be actions whose status as intrinsically choiceworthy, because constitutive of *eupraxia*, nonetheless depends on their role in the plan. As parts of the whole complex action they help constitute, however, all are intrinsically choiceworthy, since the complex action is itself so. Hence the unified plan itself might be likened to the form of health in the soul of the doctor, which dictates the bodily movements that constitute, for example, producing the uniform state in a tense muscle, which is the relevant defining mark of health (*Met.* 1032^{b}6–10).

The actualization of the plan, the setting of it in motion, is an action, as is the carrying out of the subsequent steps. In performing each of them, the agent is achieving the goal of acting well. For acting well, since it is not an external end, is not something achieved only when the plan is fully executed, as health is produced only when the muscles relax and the patient becomes healthy. At the same time, it does not seem to be an entirely internal end, either, since the plan may fail to be completely carried out. We set the associated plan in motion, which is a basic action, but whether we will succeed in carrying it out fully is in part a matter of luck. If we fail through no fault of our own, we have in one way done what is required of us—we have tried; and that is all that we could do. In another way, though, we have failed, and may now have something more to do, such as try again or make amends of some sort. The possibility of failure of this sort taints complex actions with unleisure, since it means there are usually obstacles or resistances to overcome in order to carry them out. Many—perhaps most—actions are surely complex. They would be unleisured, therefore, and subject to a sort of incompleteness, even if they had no additional external ends.

We might think of a political constitution as a plan for a very complex action, with the citizens, who act in obedience to its laws and so on, as its executors or agents. Similarly, a household, which is part of a city with such a constitution, is also such an executor (*Pol.* 1260^{b}8–20), and its "constitution" is itself a plan of action, which the members of the household put into effect by doing what it prescribes. Even when what it prescribes is a production, rather than an action proper, that production too becomes part of the complex action that is the household in activity.

Action, Doable in, Done in (*prakton*): Verbals ending in *-ton* sometimes have (1) the meaning of a perfect passive participle ("done in action") and sometimes (2) express possibility ("doable in action," or, as at *EE* 1217^{a}36, "achievable by action"). A decree (*psêphisma*) seems to be *prakton* in sense (2), since it is a prescription specific enough to be acted on without further need for deliberation (*NE* 1141^{b}27–28). What it specifies is thus a possibility (a type of action) that many different particular (token) actions might actualize. Particular objects of perception that are *prakton* (1143^{a}32–33, ^{b}4–5), however, seem to be so in sense (1). A similar issue arises in the case of other important verbals, such as *aisthêton* ("perceived," "perceptible"), *epistêton* ("scientifically known," scientifically knowable"), *chôriston* ("separated," "separable"), and *haireton* ("chosen," "choiceworthy").

Activity (*energeia*)

The term *energeia* is an Aristotelian coinage, which is generally "activation" when it is being predicated of something and as "activity" when it is not. The dative or adverbial form *energeia[i]* is "active" or "actively," in order to signal its relation to *energeia*. The etymology of the coinage is unclear, but Aristotle is explicit that it has been extended from movement to other things (*Met.* 1046^{a}1–2, 1047^{a}30–32), and that it is related to another term with an *erg-* root, *ergon* ("work"): "the work is the end, and the activity is

the work, and that is why the name 'activity' is said of things with reference to the work, and extends to the actuality" (1050^{a}21–23).

Entelecheia, which is mostly used as a synonym of *energeia*, but with a slightly different connotation, is also an Aristotelian coinage: *energeia* is action, activity, and movement oriented; *entelecheia*—as the *tel-* suggests—is end (*telos*) or completion (*enteles*) oriented (1021^{b}24–30). Putting all this together: the activation or actualization of X is an activity, which is X active or actual, which is X achieving its end, which—since "the for-the-sake-of-which is the work" (996^{b}7)—is X doing its work, and being actively or actually X, and so being complete.

Aristotle needs to distinguish (1) a dead animal from a live one and (2) a dormant or sleeping live animal from an active or awake one. *Energeia* recommends itself for (2). But how, then, to distinguish the level of activity in (1) that constitutes the mere possession of a soul? Perhaps *entelecheia* is introduced for this purpose: soul is "the first *entelecheia* of a natural body that has life potentially" (*DA* 412^{a}28–^{b}1). But Aristotle also uses *energeia* in defining the soul, which is "substance and *energeia* of a certain sort of body" (*Met*. 1043^{a}35–36). If there is a difference between the two notions, then, beyond their different orientations, it is not clear what exactly it is.

An activation or actualization is always that of an associated potentiality (*dunamis*) or capacity of some subject. In some cases, when the subject is matter, such an actualization is a substance. In others it is an activity of a non-substantial sort—e.g., the actualization of the capacity to see is the activity of seeing. When something can acquire a capacity C, but has not yet acquired it, its acquisition of C is C's "first actualization" (*DA* 412^{a}28–29). When C is then actualized or activated, this is a further stage in its actualization (sometimes referred to as its "second" actualization).

Actuality, Actualization (*entelecheia*): See **Activity**

Acumen (*agchinoia*): "Acumen is a sort of good guesswork" (*NE* 1142^{b}6); in particular the sort that "hits on the middle term in an imperceptible amount of time . . . on seeing the extremes" (*APo.* 89^{b}10–15).

Admit of, Admissible (*endechesthai*, *endechomenon*): See **Possible**

Adoleschia: **Babbling**

Affection, Feeling (*pathos*): The verb *paschein* means "suffer," "undergo," "be affected by," "have things done to one," so that *pathê* are things that one is passive rather than active with respect to. Attributes, as things attributed to or predicated of a subject, are thus affections of it, even if they are not the results of the subject's being affected by anything. The starting-point of all affections is "condensation and rarefaction" (*Ph*. 260^{b}8).

Affirmation (*kataphasis*): (1) When it refers to what is affirmed rather than the affirmation of it, *kataphasis* is usually "positive," and its opposite, *apophasis*, usually "negative," or "negation." (2) Aristotle distinguishes between an affirmation (*kataphasis*) and a phrase (*phasis*) (*Int*. 16^{b}26–31), but sometimes, as at *Int*. 21^{b}21 and *DA* 430^{b}26–27,

he fails to keep the distinction in mind, employing *phasis* when *kataphasis* seems more correct. See **Phrase**

Agathos: **Good**

Agchinoia: **Acumen**

Agelaios: **Herd, Live in a**

Agent (*proxenos*): A *proxenos* like a consul or ambassador, the representative of city X to city Y, a citizen of Y, not of X.

Aggregation (*sugkrisis*): See **Disaggregation**

Agriotês: **Wildness**

Aidoion: **Sex Organ**

Air (*aêr*): (1) "We must understand that of what we call 'air' the part surrounding the earth is, as it were, wet and hot because it is vaporous and contains exhalations from the earth" (*Mete*. 340^{b}24–26). (2) "All earthen vapor has the capacity of coarse-grained air" (*GA* 784^{b}15). See **Breath**

Aischron: See **Noble**

Aisthêma: **Perceptual Affection**

Aisthêsis: **Perception, Perceptual Modality**

Aisthêtêrion: **Perceptual Organ**

Aisthêtikon: **Perceptual Part, Perceptual Capacity**

Aisthêton: **Perceptible Object**

Aisumnêtês: **Dictator**

Aitêma: **Postulate**

Aithêr: **Ether**

Aitia, *Aition*: **Cause**

Akantha: **Spine**

Akmê: **Prime**

Akôn: **Involuntary**

Akrasia: **Self-Control, Lack of**

Akribês: **Exact**

Alêtheia: **Truth**

All (*pan*): **Universe, the**

Alloiôsis: **Alteration**

Alteration (*alloiôsis*): Movement or change in the category of quality. (1) "There is alteration when the underlying subject, which is perceptible, while remaining [the same], changes in its own affections, which are either contraries or intermediates" (*GC* 319^{b}10–12). (2) "Everything that is altered is altered due to perceptibles, and . . . there is alteration only of those things that are said to be intrinsically affected by these" (*Ph.* 245^{b}3–5).

Amesos: **Immediate**

Anagkê, anagkaion: **Necessary**

Analogy (*analogia*): When A is said to be B by analogy, there is a single thing or nature X present in A, which is the ontological correlate of B, and which can be an object of genuine scientific knowledge, even if it lacks a name: (1) "It is impossible to come up with one identical thing that cuttlefish bone, fish-spine, and animal bone should be called; but there will be things that follow these too, just as if there were some single nature of this sort" (*APo*. 98^{a}21–23). (2) "As for the underlying nature, it is scientifically knowable by analogy" (*Ph*. 191^{a}7–8).

Analusis: **Analysis**

Analysis (*analusis*): The formulation of premises or the uncovering of deductive (syllogistic) form in everyday, ordinary-language arguments (*APr*. 1.32–46).

Anamimnêskein: **Remember**

Anatomai: ***Dissections***

Andreia: **Courage**

Anemos: **Wind**

Anger (*orgê*): "Desire, involving pain, for apparent revenge, because of apparent contempt on the part of someone unfitted to treat the person himself, or one of those close to him, with contempt" (*Rh*. 1378^{a}31–33). See **Spirit**

Animal (*zô(i)on*): (1) "The animal is defined by the possession of perception" (*Somn*. 454^{b}24–25). The fishes, birds, and insects are thus included among the animals. (2) "The work of most animals is pretty much nothing other than that of plants, namely, [to generate] seed and fruit" (*GA* 717^{a}21–22). (3) A *zô[i]on* can also be a figure in a picture, which need not be the figure of an animal.

Animals, Kinds of: Aristotle is explicit that "one must from the outset divide the one [kind] into many [differences]" (*PA* 643^{b}23–24) and that "it is necessary for there to be many differences that are not under one division" (644^{a}7–8). At *Met*. 1038^{a}8–18 he is probably simplifying things for the sake of clarity and economy of expression, since the (imaginary) animals in the kind considered there have feet as their only

necessary part, so that the differences of feet alone determine their form. The suggestion (*Pol*. 1290^{b}25–37) that each of the possible ways of combining the differentiated necessary parts is a distinct form needs to be tempered by the fact that not all such combinations need be viable—able to survive in some natural habitat: "there are in fact many forms of nourishment, and that is also why the ways of life of both animals and human beings are many; for it is impossible to live without nourishment, so that differences in nourishment have produced different ways of life among the animals" (*Pol*. 1256^{a}19–22). See **Blend**

Animate (*empsuchon*): Literally, "ensouled." "What is animate . . . seems to differ from what is inanimate most of all in two regards: moving and also perceiving" (*DA* 403^{b}26–27).

Anthrôpos: **Human Being**

Antidosis: **Exchange of Property Trial**

Antikeimenon: **Opposite**

Antiperistasis: **Reciprocal Replacement**

Antistrephein: **Convert**

Apeiron: **Unlimited**

Aphairesis: **Abstraction**

Aphrosunê: **Foolishness**

Apodeixis: See **Science**

Apokrisis: **Secretion**

Apolausis: **Indulgence**

Apophasis: See **Affirmation**

Aporia: **Puzzle**

Appear (*phainesthai*): (1) The verb *phainesthai* when used with a participle endorses what appears to be so and is "it is evident that," "manifestly," or the like, and when used with an infinitive it neither endorses nor rejects what appears to be so is "appears." When it occurs without a participle or an infinitive, it may either endorse or reject. (2) Things that appear so to everyone or to wise people who have investigated them are acceptable beliefs (*endoxa*). (3) The nouns corresponding to *phainesthai* are *phantasia* and *phantasma* ("appearance").

Appear to Be So, Things That (*phainomena*): *Phainomena* are things that appear (often, but not always, to perception) to be true, but that may or may not be true.

Appearance (*phantasia*, *phantasma*): (1) (Perceptual) appearances can remain in the perceptual organ "even when the perceptible objects are gone" (*DA* 425^{b}24–25), and so are the sorts of things that can be retained in memory and function as the contents of the imagination (also *phantasia*). (2) But another sort of appearance is deliberative and occurs only in rational animals (434^{a}5–11).

Appetite (*epithumia*): A desire for what is pleasant and an aversion to what is painful (*DA* 414^{b}5–6, *NE* 1111^{b}16–17, *Rh*. 1370^{a}17–18).

Arbitrator (*diaitêtês*): "The arbitrator looks to what is decent, while the judge looks to the law" (*Rh*. 1374^{b}20–21). See **Decency**

Archê: **Rule, Starting-Point**

Architectonic (*architektonikos*): See **Craft**

Aretê: **Virtue**

Argument: *Logos*

Aristocracy (*aristokratia*): An aristocracy in the strict sense is rule by the truly best (*aristos*) people, who, in Aristotle's view, are those possessed of unconditional virtue of character and practical wisdom. The constitution described in *Pol*. 7–8 is an aristocracy of this sort. Other lesser sorts of aristocracies are discussed in 4.7.

Assembly (*ekklêsia*): The body of adult male citizens had ultimate decision-making power in many constitutions. Its membership and frequency of meetings varied from constitution to constitution.

Asteios: **Elegant**

Astêr: **Star**

Astringent: *Struphnos*

Athanasia: **Immortality**

Athanatizein: **Immortalize**

Athlios: **Wretched**

Atmis: **Vapor**

Atomon: **Individual**

Aulos: **Pipe**

Austêros: **Harsh**

Autarkês: **Self-Sufficient**

Automata (*automata*): Puppets operated by a concealed inner mechanism mentioned at *GA* 734^{b}9–17, 741^{b}9, *Met*. 983^{a}14, and discussed in most detail at *MA* 701^{b}1–32.

Automaton: See **Luck, Spontaneous**

Axiom (*axiôma*): "An immediate deductive starting-point . . . that it is necessary for someone to grasp who is going to learn anything at all, I call an 'axiom'" (*APo*. 72^{a}14–17).

Babbling (*adoleschia*): *Adoleschia*, in its somewhat technical sense, consists in being compelled, typically in a dialectical discussion, to say "the same thing repeatedly" (*SE* 165^{b}16–17). It has this sense at *Top*. 130^{a}34, *SE* 173^{a}31–^{b}16, 181^{b}25–182^{a}6. In a less technical sense, it is associated with lack of perspicuousness (*Rh*. 1406^{a}34, 1414^{a}24).

Banausos: **Unrefined**

Barbarian (*barbaros*): *Barbaros*, which may mean no more than "foreign" or "non-Greek," nonetheless often has negative connotations. (1) "A barbarian and a slave are by nature the same" (*Pol*. 1252^{b}9). (2) "Barbarians are by nature more slavish in their characters than Greeks" (1285^{a}20–21) (3) "The beast-like sort . . . occurs most among barbarians" (*NE* 1145^{a}30–31; also 1149^{a}9–11). (4) Peoples from cold northern European regions are "full of spirit but somewhat deficient in thought and craft knowledge" (*Pol*. 1327^{b}24–25).

Baros: **Weight**

Baru: See **Sharp and Dull**

Base, Bad (*phaulos*): An antonym of *kalos* ("noble") and of *agathos* ("good").

Be, Being (*einai*, *to on*): Our verb "is" has four different senses or meanings: (1) Existential "is": "A is" means "A exists." (2) "Is" of identity: "A is B" means "A is identical to B" or "A is one and the same thing as B." (3) "Is" of predication: "A is B" means "B belongs to A." (4) Veridical "is": "A is" means "A is true." In his account of being in *Met*. 5.7, Aristotle mentions a sort of being that corresponds to (2) and to (4), and, in 5.9 and at 1054^{a}32–^{b}3, he has much to say about identity and sameness, including that "whatever is a being is either distinct or the same" (1054^{b}25). (1) is absent from his discussion, although the distinction between potential and actual being bears on it, and it does seem to play some role in explaining what a primary substance is (*Cat*. 2^{b}6). One reason for this is that being itself is not a kind (*APo*. 92^{b}14) and that a demonstrative science posits the existence of the kind it investigates, and proceeds to investigate it (*APo*. 76^{b}11–22, *Met*. 1064^{a}2–4), so that existence itself escapes the focus of the science. This does not mean, however, that there may not be puzzles to solve before the existence of the posited kind can be taken as established (*Met*. 1026^{a}23–32).

Beast-Like (*thêriôdês*): (1) "Temperance and intemperance are concerned with the sorts of pleasures that the rest of the animals share in as well (which is why they appear slavish and beast-like); these pleasures are touch and taste" (*NE* 1118^{a}23–26). (2) "We also use 'beast-like' as a term of abuse for those who exceed human beings in their vice" (1145^{a}32–33). (3) Applied to non-human animals, it means "savage" (*PA* 663^{a}13).

Beautiful: See **Noble**

Being for, the (*einai* + dative): The being for A = what A is intrinsically = the essence of A (*Met*. 1029^{b}13–16).

Belief (*doxa*): Belief is "no less concerned with eternal [things] and impossible ones than with ones that are up to us" (*NE* 1111^{b}30–33), which are the ones found among the perceptible particulars that we can change through our voluntary actions. At the same time, ("mature") belief presupposes a capacity for rational calculation: "Perceptual imagination . . . also belongs to the other animals, but the deliberative sort exists [only] in the rationally calculative ones. . . . And this is the cause of these animals seeming not to have belief, namely, that they do not have the [imagination] that results from a deduction" (*DA* 434^{a}6–12). Hence the part or capacity of the soul that forms beliefs is the same as the part that calculates or deliberates (*NE* 1140^{b}25–26, 1144^{b}14–15). Unlike calculation and deliberation, however, which are sorts of inquiry, what one believes is "already determined," since belief is "not inquiry but already a sort of affirmation" (1142^{b}11–14). That is why believing is of necessity done either falsely or truly. For it is a form of affirmation, and "to say of what is that it is not, or of what is not that it is, is false, while to say of what is that it is, or of what is not that it is not, is true" (*Met*. 1011^{b}26–28). It is also why believing is not up to us. See **Supposition**

Belief, in Accord with (*kata doxan*): Contrasted with "in accord with truth" and associated in particular with dialectic (*APr.* 1.30, *APo*. 81^{b}18–19).

Beliefs, Acceptable (*endoxa*): "Acceptable beliefs . . . are things that seem so to everyone, to the majority, or to the wise—either to all of them, or to most, or to the best known and most reputable" (*Top*. 100^{b}21–23).

Belong to, Holds (*huparchein*): When B is predicated of A, so that A is correctly said to be B, then (it is true that) B belongs to A. When no subject is specified for B, but B is the case, B holds.

Beyond (*para*): (1) Sometimes *para* (+ accusative) simply means "besides" or "in addition to" or the like (*Ph*. 200^{b}32, 251^{b}25, 259^{a}4, *DA* 414^{b}21, 424^{b}17, *PA* 641^{a}35, *Met*. 1010^{b}36, 1086^{b}31, *NE* 1095^{a}26). (2) When universals are said by Platonists to be "beyond" particulars, in the sense of being ontologically independent of them, Aristotle rejects the view (*APo*. 77^{a}5, 89^{b}19, *Met*. 1033^{b}20, 1038^{b}32). But this is because each universal is also said to be a this something (*Top*. 178^{b}37–179^{a}5). In sense (1), Aristotle agrees that universals are "beyond" particulars (*APo*. 100^{a}7).

Bia: **Force**

Bile (*cholê*): See **Gallbladder**

Bios: **Life**

Blend (*krasis*): The concept of a blend, which is contrasted with that of a mixture (*Top*. 122^{b}30–31), plays an important role in explaining the effects of the environment and climate (another meaning of *krasis*) on the bodies, souls, life expectancy, and classification of animals. (1) "Region differs from region, and water from water, in these respects due to the same causes; for the nourishment and especially the condition of the body become of a certain quality due both to the blend of the surrounding air and of the things that enter in, especially the liquid nourishment" (*GA* 767^{a}28–32). (2) "The places in the sea that are inshore succeed in blending hot and cold well; that is also why, in fishes of [the inshore] sort, the flesh is more firm in composition, while that of the deep-sea fishes is watery and flaccid" (*HA* 598^{a}6–9). (3) "The animals that are very watery are more cowardly; for fear cools. Those, then, that have a blend of this sort in the heart are predisposed to this affection; for water is solidified by cold" (*PA* 650^{b}27–30). (4) "The cause of long life in any sort of animal is its being blended in much the same way as the surrounding air" (*GA* 777^{b}6–7). (5) "Since the animals have been divided into the aquatic and terrestrial in three ways (by taking in air or water, by the blend of their bodies, and third by the sorts of their nourishment), their lives follow along in accord with these divisions; for some animals, [their classification] follows along in accord with the blend and the nourishment and in accord with taking in water or air, while [the classification of] others follows along in virtue of the blend and [what sustains] their lives alone" (*HA* 590^{a}13–18).

Blessed (*makarios*): *Makarios* often just means "happy," but sometimes with the implication of being extremely happy (*NE* 1101^{a}7) or in a condition like that of the gods (1178^{b}25–32).

Blood (*haima*): Blood for Aristotle is exclusively red blood, which "is produced by concoction from serum" (*HA* 521^{a}17–18). It is focally discussed in *HA* 3.19, *PA* 2.1–4. It is usually treated as a uniform part of the blooded animals (*HA* 487^{a}1–3, 511^{b}1–2, *PA* 647^{b}12), but perhaps because—like urine in the bladder—it is found "lying in the heart and in the blood vessels like in a container" (*PA* 650^{b}7–8), rather than being attached to them, it is not strictly speaking a part of them (656^{b}21–22). See **Serum**

Blood Vessel (*phleps*, *phlebion*): The great blood vessel (*HA* 509^{b}34, *GA* 738^{a}10) is the vena cava and the whole venous system; the aorta included the whole arterial system. Both alike nourish the body by being conduits for the blood to all parts of it. The fine vessels are the smallest veins and arteries visible to the naked eye, not the capillaries.

Bloom (*hôra*): Young men, whose beards have not yet begun to grow, have a *hôra,* as perhaps do those in their prime. See **Boy Love**; **Pleasure**

Body (*sôma*): "What is divisible in quantity in one dimension is a line, in two a plane, in all—that is, in three—a body" (*Met*. 1016^{b}27–28). Such a body may be: (1) a geometrical solid (*Cael*. 268^{a}7, *Met*. 1020^{a}14, 1029^{a}13); (2) a perceptible, natural, material body, composed of an element or elements (*Ph*. 187^{a}13, 205^{b}26, *Cael*. 275^{b}5, *Met*. 1017^{b}10, 1028^{b}10, 1042^{a}9); (3) the instrumental body of a living thing, whether plant or animal (*DA* 412^{a}16, ^{b}6, 415^{b}19).

Body, Perceptible: A perceptible body is a tangible body, and "a tangible body is that for which touch is the perceptual modality" (*GC* 329^{b}7–8).

Boiling (*hepsêsis*): "Concoction by wet heat of the indefinite [matter] present in the liquid [in the thing being boiled], but the name is said in the strict sense only of things being cooked by boiling" (*Mete*. 380^{b}13–15).

Bouleusis: **Deliberation**

Bowel (*koilia*): See **Stomach**

Boy Love (*paiderasteia*): *Paiderasteia*—love between an older man (*erastês*) and an adolescent boy (*erômenos*)—was an accepted practice in Classical Athens. Sex was common in such relationships, with the boy playing the passive role. Once the boy reached manhood, however, and his bloom faded (*NE* 1157^{a}8), that had to change. On pain of losing his citizen rights, he could no longer be a passive sexual partner. Instead, he was expected to marry, have children, and become an *erastês* in his turn. Though sexual in nature, the relationship was conceived as primarily educative: by associating with someone who was already a man, a boy learned virtue or excellence and how to be a man himself. Rites of passage in some primitive warrior societies also involve sexual contact between men and boys, and it is sometimes suggested that Greek *paiderasteia* also had its roots in a warrior past.

Brain (*egkephalos*): The brain is an important organ for Aristotle, but its importance is negative rather than positive, since it exists mainly to cool the blood, and is by nature the "the coldest part of the body"(*GA* 783^{b}28–29), largest and wettest in human beings (*HA* 494^{b}28–29, *GA* 784^{a}3–4), bipartite (*PA* 669^{b}21–22), and bloodless (*HA* 514^{a}18).

Breath (*pneuma*)

Despite its manifest importance in the transmission and preservation of form, no focused discussion of breath—the innate (*sumphutos*) variety of which "is present in all [animals] by nature and is not brought in from outside" (*PA* 659^{b}18–19)—occurs in Aristotle's genuine extant works. But by piecing together what he does say, a reasonably clear picture emerges.

The role accorded to breath in animal movement, for example, shows that it transmits movement by being itself in movement: "It is evident that breath is naturally well-disposed to be capable of causing movement and supplying strength. And the works of the movement are pushing and pulling, so that the instrument must be capable of being expanded and contracted. And such is the nature of breath; for since it is

contracted and expanded without force, it is capable of pushing and pulling by force due to the same cause" (*MA* 703^{a}18–23; cf. *PA* 659^{b}17–18). Moreover, because the movements it imparts can be formative, as in the case of those involved in the transmission of form itself, they must be complex and various—able, as geneticists now put it, to *code for* all of an animal's parts.

Since "everything that is in spatial movement moves either with a circular, a rectilinear, or a mixed movement" (*Ph.* 261^{b}28–29), all the complex movements breath can produce must be some such combination. What makes this possible is that by actively expanding and contracting, and so pushing and pulling, it can cause not just rectilinear but also circular movements: "rotating is a compound of pulling and pushing; for what is rotating a thing is pulling one part of it and pushing another; for it leads one part away from itself and another part toward itself" (244^{a}2–4). Hence all movements can be caused by breath (*DA* 433^{b}25–26).

Though breath is assigned a role in the transmission of form to uncontroversially animate beings, it is also used to explain other phenomena, such as transparency: "it is not insofar as something is water or insofar as it is air that it is transparent, but because there is a certain nature in it that is the same in both of them and in the eternal body above" (*DA* 418^{b}7–9; also *Sens.* 439^{a}21–25). Then, because breath is involved in soul transmission, soul is to some extent itself attributed to anything in which breath is present.

When "the capacity of all soul" is associated with "the nature in the breath, which is an analog of the element belonging to the stars" (*GA* 736^{b}37–737^{a}1), the point of analogy is that the nature in question is both transparent and—when combined with other elements, whose movements are rectilinear—an appropriate transmitter of soul, form, and life. For the element that belongs to the stars, which is *ether*, or primary body (*sôma prôton*), is a body "beyond the ones composed here, more divine and prior to all these" (*Cael.* 269^{a}32), and is both transparent and in eternal circular movement (270^{a}12–^{b}25). Hence breath is a "body more divine than the so-called elements" (*GA* 736^{b}31), because it is an analog of ether, which is in fact more divine than they.

Focusing now on breath, let us see how best to understand it. One thing we know is that, by being expanded and contracted, it is capable of "pushing and pulling" (*MA* 703^{a}20), but another is that it is "hot air" (*GA* 736^{a}1). Putting the two together we have air increasing in size and contracting due to heat. And this heat is primarily a factor to be understood in terms of its natural upward movement. For breath is not a new element, but rather a construction from old ones introduced to explain the existence in the sublunary world of the circular movements crucial for the transmission and preservation of forms, and so for the coming to be and passing away of the matter-form compounds whose forms they are. But it is equally central to the explanation of animal movement, perception, and thought (*MA* 701^{b}1–32). Form of every variety, one might *almost* say, just is a sort of movement. See **Form, Transmission of**

Breeding, Good (*eugeneia*): (1) "Good breeding is in accord with the virtue of the stock, while being true to one's stock (*gennaion*) is in accord with not being a degeneration from nature" (*Rh*. 1390^{b}22–23). (2) "An animal is well-bred if it comes from good stock; it is true to its stock in not being a degeneration from its own nature" (*HA* 488^{b}18–20). See *Rh*. 1360^{b}31–38, F126–127.

Bregma (*bregma*): The bone that finally grows over the anterior fontanelle.

Buffoon (*bômolochos*): Discussed at *NE* 1128^{a}4–35.

Capacity (*dunamis*): (1) A *dunamis* is a capacity, power, or potentiality something has that makes it possible (*dunatos, endechesthai*) for it, e.g., to cause movement in something else or to be caused to move by something else. It is discussed in *Met*. 5.12. (2) Such a capacity may be either rational or irrational (*Met*. 9.2). (3) In a sense related to (1), a *dunamis* may also be a thing that contributes to the exercise of a capacity or power: "Capacities . . . are things that the excellent person has the capacity to use well, the base person badly" (†*MM* 1183^{b}27–30). (4) Crafts and sciences are often lumped together with capacities as things that can be used to achieve opposite effects, as medicine can be used to cure but also to kill (*NE* 1129^{a}13–14). Sometimes, though, a body of knowledge is classified as a capacity rather than a science, because it is not confined to a single kind (*Rh*. 1359^{b}12–16). (5) In some contexts, a *dunamis* is a force of some sort, as in our "armed forces" (*Pol*. 1321^{a}14). See also **Activity**

Category (*katêgoria*): The term *katêgoria* comes from the verb *katêgorein*, which means "predicate." When B is predicated of A, B falls into some category, depending on what sort of thing B is: "These are ten in number: what-it-is, quantity, quality, relative, when, where, position, having, doing, and being affected. For the coincidents, the kind, the special affections, and the definition will always be in one of these categories" (*Top*. 103^{b}21–25). For each of the intrinsic beings in these ten categories we can specify its what-it-is (*Met*. 1030^{a}17–25), even if, strictly speaking, only substances have definitions and essences (1031^{a}7–14). A category itself is quite often referred to as a kind (*Cat*. 11^{a}38, ^{b}15, *Ph*. 189^{a}14, *Met*. 1070^{b}20, 1089^{b}28).

Catharsis: See **Purgation**

Cause (*aitia, aition*): The four sorts of causes Aristotle recognizes are the final, the formal, the efficient (or moving cause), and the material (*APo*. 94^{a}21–24, *Ph*. 194^{b}23–195^{a}3, *Met*. 983^{a}26–32). The first two, or the first three, are sometimes identical (*Ph*. 198^{a}24–27). Though *Met*. 1013^{a}17 states that "all causes are starting-points," sometimes a starting-point is "primary among the causes" (*GC* 324^{a}27–28). *Met*. 1003^{b}23–24 states the more typical view that starting-point and cause follow along with each other.

Champion, Sponsor (*prostatês*): Usually a leader of the people (*dêmos*) who championed their cause (*Pol*.1305^{a}20, ^{b}17, *Ath*. 2.2, 13.4, 21.1, 23.3, 25.1), but also a "sponsor" of

resident aliens (*Pol.* 1275^{a}13, *Ath* 58.3), who could represent them in, e.g., legal proceedings, which were closed to non-citizens.

Chance (*to automaton*): See **Luck**

Change (*metabolê*): "There are three sorts of change: that from an underlying subject to an underlying subject; that from an underlying subject to what is not an underlying subject; and that from what is not an underlying subject to an underlying subject. For there is no change from what is not an underlying subject to what is not an underlying subject, because there is no opposition; for the terms are not contraries nor is there any contradiction involved" (*Ph.* 225^{a}7–12). See **Movement**

Character (*êthos*): A state formed by habituation (*NE* 1103^{a}17), having to do with feelings and desires, pleasures and pains, which, when in accord with correct reason, is virtuous.

Choice: See **Deliberate Choice**

Choiceworthy (*haireton*): See **Action, Doable in**

Chorêgos: **Patron**

Chorion (*chorion*): The term "chorion" now refers to the exterior envelope of the embryo in mammals, birds, and reptiles. Aristotle, however, seems to use it to refer to what is now called the allantois, a membrane lying below the chorion and forming part of the placenta in certain mammals (*HA* 561^{b}31–562^{a}1).

Chôriston: **Separable**

Chrêmata: **Wealth**

Chumos: **Humor**

Citizen (*politês*): An "unconditional citizen (*politês haplôs*)" is someone who shares in judicial and deliberative office (*Pol.* 3.1–2, 5). But the term "citizen" has a broader application than that. Citizens who share in the constitution are thus contrasted with a larger class of citizens who do not (1332^{a}32–35); kings, unlike tyrants, are said to have fellow citizens as their bodyguards (1285^{a}25–29), again implying that it is possible to be a citizen without sharing in office—since in a kingship only the king is an unconditional citizen; those who share in the advantages of office, but not in office itself, are citizens (1279^{a}31–32); and women and children are implicitly included among the citizens (1260^{b}15–20, 1299^{a}20–23). Some of this apparent disunity is explained by the fact that a citizen is defined relative to a city and a constitution (1275^{a}33–^{b}21), so that a person might be referred to as a "citizen" even if he counted as a citizen only relative to a certain constitution. But it is also no doubt true that Aristotle sometimes uses the term in the loose and popular sense to apply to anyone who passes the sorts of pragmatic tests of citizenship mentioned in *Pol.* 3.2—e.g., having parents who are citizens. In every constitution, however, the office holders and the unconditional citizens are the same.

Citizen, Uncontested (*anupeuthunos*): Those whose citizen birth is clear on both sides (*Pol.* 1275^{b}22–26, 1292^{b}35–36).

City (*polis*)
A *polis* (plural: *poleis*) is a unique political arrangement, something like a city and something like a state (hence "city," "state," and "city-state," are all common translations). For unlike a city a *polis* enjoyed the political sovereignty characteristic of a modern nation-state (it could possess its own army and navy, enter into alliances, make war, and so on), whereas, unlike a typical state, it was a politically, religiously, and culturally unified community, and quite small-scale. Its territory included a single (typically) walled area, which is the "city proper (*astu*)," with a citadel (*akropolis*) and a marketplace, which, as the political and governmental heart of things, is itself often referred to as the *polis* (*Pol*. 7 provides many examples of this), and also included the surrounding agricultural land. Citizens lived there as well as inside the city proper.

Because a *polis* is a multitude of citizens (1274^{b}41), Aristotle's conception of it inherits some of the complexity inherent in his notion of a citizen. A *polis* is not just a multitude of citizens, however, but a community of citizens sharing a constitution (1276^{b}1–2), so that *poleis* with different constitutions are also different (1276^{b}10–11). Moreover, while a *polis* includes women, children, and slaves (1260^{b}8–20, 1269^{b}14–19, 1277^{a}5–10), strictly speaking only the unconditional citizens, who share in judicial and deliberative office, are genuine parts of it (1328^{a}21–^{b}2, 1329^{a}2–5, 1329^{a}19–24).

A *polis*, unconditionally speaking, is a political community consisting of free citizens governed by a constitution—a community of similar people aiming at the best life possible (*Pol*. 1328^{a}35–37). It is the natural community for human beings to live in (1253^{a}7–18, 1278^{b}19–25), since there, and only there, can they achieve the happiness that is their natural end.

Clan (*phratra*): See **Tribe**

Clepsydra: A clepsydra is a water clock in which time is measured by water dripping slowly from a small opening at the bottom when the top is opened. But when water is instead allowed to enter and then the top is closed, it also functioned as a pipette or syphon, which is how it is functioning at *Ph*. 213^{a}27, *Cael*. 294^{b}21.

Clever, Cleverness (*deinos*, *deinotês*): "The sort of thing that, when it comes to the things that further hitting a proposed target, is able to do these and to hit upon them" (*NE* 1144^{a}23–26). It is required for practical wisdom, but is not the same as it (1144^{a}28–29, 1152^{a}10–14).

Coarse-Grained, Fine-Grained (*pachus*, *leptos*): "What has small parts is fine-grained and what has large parts is coarse-grained" (*Cael*. 303^{b}26–27). When applied to things such as skin, membranes, or bone, however, coarse-grainedness implies thickness (and vice-versa), since a single layer of coarse-grained material is thicker than a single-layer of fine-grained material. Sometimes, then, *pachus* is "coarse," "thick," or (as applied to animals) "fat," *leptos* as "thin." The discussion of hairs in *GA* 5.3 is a revealing case in

point, since what explains their fineness or coarseness is the size of the ducts or pores in the skin—in other words, the skin's fine-grainedness or coarse-grainedness. When contrasted with *eurus* ("broad"), *leptos* is again "thin" (*HA* 512^{b}6).

Coincident (*sumbebêkos*): A standard Aristotelian contrast is between what has an affection coincidentally or contingently (*kata sumbebêkos—per accidens* in Latin), making the affection a coincident of it, and what has that affection intrinsically or non-contingently (*kath' hauto* or *per se*) (*Met*. 1022^{a}24–36). Affections that belong to something contingently are of no interest to a science of that thing, since they cannot be demonstrated to hold of it either universally or for the most part, and all science is demonstrative (1026^{b}3–5). But some coincidents are demonstrable and so are of interest to science. These are the intrinsic coincidents or *per se* accidents—"the coincidents connected to the substances" (*DA* 402^{b}18)—that are not parts of a thing's substance or essence, but are demonstrable from it, as having internal angles equal to two right angles is demonstrable from the definition of a triangle's essence (*APo*. 75^{b}1, 83^{b}19, *Met*. 1025^{a}30–32, 1078^{a}5–9).

Cold (*psuxis*): "Privation of heat" (*GA* 743^{a}36). Also, *Mete*. 380^{a}7–8, *PA* 649^{a}18–19, 784^{a}33, *Met*. 1070^{b}11–12.

Colliquescence (*suntêgma*, *suntêxis*): Sometimes colliquescences are residues (*PA* 677^{a}13), as is unconcocted nourishment. But sometimes the two are distinguished: "By a 'residue' I mean a leftover of the nourishment, by a 'colliquescence,' what has been secreted from a growth-producer by a contrary-to-nature dissolution" (*GA* 724^{b}26–28). Residues, such as excrement and urine, have natural exit points from the body, but "no place is assigned to a colliquescence in accord with nature, rather it flows wherever there is an easy route in the body, while to all the residues a place in accord with nature is assigned" (725^{a}33–35). Sweat is an example.

Column (*sustoichia*): (1) In *APr*. and *APo*. a *sustoichia* seems to be a series of terms of whatever sort. (2) At *Met*. 986^{a}23, 1093^{b}12, it is one of a pair of columns in a Pythagorean classification of starting-points, the first being that of good ones (*NE* 1096^{b}6) or noble ones, the second that of bad or evil ones. (3) At *Met.* 1004^{b}27 it is one of a pair of columns of opposites, one consisting of "positive" notions, the other of privations. 1066^{a}15 and 1072^{a}31 also refer to this, suggesting that it is a device or way of thinking that Aristotle himself accepts (*PA* 670^{b}21). (4) At *Met*. 1054^{b}35, 1058^{a}13 it is a "column of predication," and seems to be the sort relevant also at *Top*. 114^{a}35, where the adjective *sustoichos* applies to a column of co-ordinate predicates, one lot of which are inflections of the other.

Comedy (*kômô[i]dia*): Defined at *Po*. 1448^{a}17–18, 1449^{a}32–34, and discussed in F167.

Coming to Be, Generation (*genesis*): (1) "Among things that come to be, some do so by nature, some by craft, and some from chance, but they all come to be both as a result of something and of or from (*ek*) something, and they all come to be something"

(*Met*. 1032^{a}12–14). (2) "Things are said to come to be in many ways, and some things are said not to come to be but to come to be a this something, while only substances are said to come to be unconditionally" (*Ph*. 190^{a}31–33). (3) "Coming to be is to contraries and from contraries" (*GC* 331^{a}14). (4) To generate (*gennan*) something is to cause it to come to be, so that generation (also *genesis*) is the process of coming to be that is so caused. It is "the first participation in the heat of the nutritive soul" (*Juv*. 479^{a}29–30). (5) Passing away (*phthora*) is the contrary of coming to be. It "comes about owing to a failure of a certain sort of heat, which in complete living beings is the one found in the part in which the starting-point of their substance resides. This starting-point is located . . . where the up and the down are joined together: in plants midway between the stem and the root, in blooded animals in the heart, and in bloodless animals in the analogous part." (*Juv*. 478^{b}30–479^{a}1). If X causes Y to pass away, X destroys (*phtheirein*) Y.

Commerce, Craft of (*kapêlikê*): The part of wealth acquisition, but not of household management (*Pol*. 1257^{a}41–1258^{a}18), that produces wealth through exchange (1257^{b}20–22). It is concerned with money as opposed to natural wealth, and involves getting wealth at the expense of others. Usury (*obolostatikê*) is a part of it (1258^{a}38–^{b}2). See **Exchange, Craft of**

Common Things (*koina*): Things that are common to more than one science and special to none. Like acceptable beliefs, they can thus figure as premises in dialectical arguments (*Top*. 101^{a}30–34, *SE* 170^{b}8–11, *Rh*. 1355^{a}25–28). Indeed, the "most stable starting-point of all," the one it is "impossible to be deceived about" (*Met*. 1005^{b}11–12)—which is the principle of non-contradiction (1011^{b}16–17)—is such a belief, and "all who are carrying out a demonstration lead it back to this as an ultimate belief; for this is by nature the starting-point of all the other axioms too" (1005^{b}32–34). So logic, to call it that, is a common thing, since all sciences rely on it in constructing their demonstrations. See **Dialectic**

Communal Messes (*phiditia*, *sussitia*): A political institution, which Aristotle himself favors, that served both to feed citizens and to promote bonding between them (*Pol*. 1330^{a}3–8).

Community (*koinônia*): A community consists of people of different sorts, who engage in an enterprise that involves sharing something in common (*Pol*. 1260^{b}39–40), and who are bound to one another by a sort of friendship and a sort of justice as a result. A household, a city, and a constitution are thus all communities, but so are master and slave, partners in a business transaction, and fellow travelers (1263^{a}17). All or most of these are encompassed by the political community (1252^{a}5–6, *NE* 1160^{a}14–23).

Comparison (*parabolê*): Argument by analogy based on similarity.

Compelled, Compulsion: See **Necessary**

Complete (*teleion*): The adjective *teleios* is cognate with the noun *telos* ("end," "goal"). Some of its senses are distinguished at *Met*. 5.16. Completeness is attributed to the city

(*Pol*. 1252^{b}28, 1280^{b}40), to happiness (*NE* 1097^{a}34), to lives (1098^{a}18, 1101^{a}16), and to virtues (1098^{a}18, 1102^{a}6, 1129^{b}30), as well as to actions (*Met*. 1048^{b}22), differences (1055^{a}16), and many other things. (2) "Virtue is a sort of completion (for when each thing acquires its own virtue, at that point it is said to be complete—for then it is most of all in accord with its nature, just as a circle is complete when it has most of all become a circle and when it is best)" (*Ph*. 246^{a}13–16; also *Met*. 1021^{b}20–21). (3) Some things are complete because they have all their parts: "Living (*zôê*) can be complete or incomplete, and virtue is the same way (for in one case it is a whole, in another a part)" (*EE* 1219^{a}37–38; also *NE* 1130^{a}9). But others are complete in a different way: "what is unconditionally complete is what is always intrinsically choiceworthy and never choiceworthy because of something else" (*NE* 1097^{a}33–34). This latter sort of telic completeness seems to be the sort possessed by theoretical wisdom, since it is "the best and most complete" virtue (1098^{a}17–18, 10.8).

Composition, Composite (*sunthesis*): A composition is something that results from combination (*Rh*. 1365^{a}17) or putting together (*NE* 1174^{a}23), typically involving the acquisition of a form—or level of formation—that was previously lacked: "what encompasses, that is, the limit, is more estimable than what is limited; for the second is matter, but the first is the substance of the composition" (*Cael*. 293^{b}13–15).

Composition or Division (*sunthesis ê diairesis*): What is not so by composition is an untrue affirmative; what is not so by division is an untrue negative.

Compound, the (*sunolon*): "Whenever something is predicated of matter" (*Met*. 995^{b}35).

Comprehension (*sunesis*): Focally discussed at *NE* 6.10, †*MM* 1197^{b}11–17. The verb *epaïein* (*Met*. 981^{a}24, 996^{b}34), which is a synonym of "know" (*Rh*. 1360^{a}19, 31), is also occasionally "comprehend."

Conceive (*sullambanein*): A female conceives X when she holds X in her uterus (*HA* 583^{b}29–32). In normal cases X is a viable fetus to which she will later give birth. But in some cases, this may not be so (*GA* 748^{b}21–23), and in others X may not be a fetus at all (*HA* 636^{a}9–28, *GA* 4.7).

Conclusion (*sumperasma*): What follows of necessity from the premises of a deduction.

Concoction (*pepsis*): "A completion due to the natural and proper heat . . . [produced] from the opposing affectables, these being the matter proper to the given thing. For when it has been concocted, it is completed and has come to be. . . . And the end in some cases is the nature—but nature, we say, as form and substance. . . . Concoction, in fact, is what everything is affected by when its matter—that is, its liquid—is mastered; for this is what is determined by the heat in its nature. For as long as the ratio is present in the latter, it is this that constitutes its nature" (*Mete*. 379^{b}18–35).

Condensation and Rarefaction (*puknôsis kai manôsis*)
(1) "The starting-point of all affections is condensation and rarefaction; for heavy and light, soft and hard, hot and cold, seem to be sorts of density or rarity. And condensation and rarefaction are aggregation and disaggregation, in virtue of which substances are said to come to be and pass away" (*Ph*. 260^{b}7–12). (2) "A thing is dense because its parts are close to one another, and rare because its parts are separated from each other" (*Cat*. 10^{a}20–22). Sometimes "open-structured" better captures the meaning of *manos* (*HA* 548^{a}32).

Consideration: *Gnômê*

Constitution (*politeia*): (1) A constitution is "a sort of life of a city" (*Pol*. 1295^{a}40–^{b}1), "a certain ordering of those who inhabit the city" (1274^{b}38) or of its various offices, "above all, of the office that controls everything" (1278^{b}9–10). And because "in every case the governing body (*politeuma*) controls the city," it gets identified with the constitution (1278^{b}10–11). (2) It is "by pursuing [happiness] in different ways and by different means each group of people produces different ways of life and different constitutions" (1328^{a}41–^{b}2). (3) A citizen is someone who shares in the constitution of his city, so that *politeia* is also citizenship, as at *Ath*. 54.3. See **Polity**

Constitution, Correct vs. Deviant
Constitutions that aim at "the common advantage are, in accord with what is unconditionally just, correct, while those that aim only at the advantage of the rulers are erroneous, and deviations from the correct constitutions" (*Pol*. 1279^{a}17–20). However, Aristotle does not specify the group G whose advantage is the common one. A natural first thought is that G should consist of all the free native inhabitants of the constitution. On that account, however, even some correct constitutions, such as a polity, will count as deviant. For the common advantage in a correct constitution is a matter of having a share in noble or virtuous living (1278^{b}20–23). A polity will thus not aim at the advantage of its native-born unrefined craftsmen, tradesmen, or laborers, since there is "no element of virtue" in these occupations (1319^{a}26–28). A second natural thought—in part a reaction to the first—is that G should consist of the unconditional citizens, who share in judgment and office (1275^{a}22–23). Yet even the deviant constitutions seem to aim at the advantage of a wider group than that, one that includes the wives and children of those eligible for such offices (1260^{b}8–20, 1280^{b}40–1281^{a}1, 1310^{a}34–36).

Though these attempts to define G all fail, the last does point in a promising direction. Begin with the class N of the free native inhabitants of the constitution. There are two ways to construct the class of unconditional citizens from N. The first is on the basis of the sort of justice internal to the constitution, the second on the basis of unconditional justice. If we proceed in the first way, and the constitution is an oligarchy, the unconditional citizens will be the rich male members of N. But if we proceed in the second way, the unconditional citizens of the oligarchy will be those who have an unconditionally just claim to that status. And Aristotle thinks that the virtuous, the rich, and the poor all have such a claim, one that is proportional to their virtue

(*Pol.* 1280^{b}40–1281^{a}8, 1283^{a}14–26, 1294^{a}19–20). So they ought to be unconditional citizens of any constitution. In fact, however, they are such only in correct constitutions, not in deviant ones.

We may now construct G as follows: all the members of N, who have an unconditionally just claim to be unconditional citizens of the constitution, are members of G; all the wives and children of members of G are members of G; no one else is a member of G. If a constitution aims at the advantage of G, it aims at the common advantage and is correct; if it aims at the advantage of the subset of G consisting of the rulers who have control of the constitution (and their families) it is deviant. This seems to be what Aristotle has in mind when he writes: "the just is the political good, and this is the common advantage" (*Pol.* 1282^{b}16–18). Nonetheless, while a correct constitution aims only at the advantage of G, Aristotle almost certainly thinks that it will be advantageous to all its members, whether they are members of G or not. He thinks this about household slaves (1252^{a}34, 1278^{b}32–37), so also, perhaps, about the public slaves or barbarian serfs who do all the work in his ideal constitution.

Within the class of deviant constitutions Aristotle also draws a distinction between deviant constitutions and their extreme or ultimate exemplars, which are so degenerate that they do not count as constitutions at all (*Pol.* 1292^{a}31, 1272^{b}2–3, 1293^{b}29, 1309^{b}34-35, 1289^{b}2, 1266^{a}3–4).

Constitution, Those Who Share in the: In the best city, (1) "all the citizens share in the constitution" (*Pol.* 1332^{a}34–35), suggesting a contrast with other cities in which this is not so, and thus also apparently drawing a contrast between sharing in the constitution and being a citizen. Similarly, (2) those who hold office are contrasted with "those in the governing body" and "those outside the constitution" (1308^{a}5–7). Since "the constitution is the governing body" (1278^{b}11), and an unconditional citizen is "defined by nothing else so much as by his participation in judgment and office" (1275^{a}22–23), the natural way to interpret (1) and (2) seems to be this: those who share in the constitution are those participants in judgment and office (i.e., the unconditional citizens) who belong to the governing body—these being the citizens who occupy or are eligible to occupy "the offices that have control of the constitution" (1309^{a}30). In the best city, then, all the unconditional citizens share in the constitution because all eventually become members of the governing body (1332^{b}35–1333^{a}3). We must distinguish, then, between the offices that are keyed to unconditional citizenship and "the most important offices" (1273^{a}29–30, 1294^{b}29–31) or "those that must most of all be called 'offices'" (1299^{a}25) that are keyed to membership in the governing body and that control the constitution.

Contact, Making (*haptesthai*): "Things are making contact [or touching] when their extremes are together in place" (*Met.* 1068^{b}27).

Contemplation (*theôria*): See **Theoretical Investigation**

Contemplative (*theôrêtikos*): See **Practical**

Contempt (*oligôria*): "There are three forms of contempt: despising, spite, and wanton aggression; for the one who despises is contemptuous; for the things people despise are the ones they think are worth nothing, and the ones they think are worth nothing they have contempt for" (*Rh*. 1378^{b}13–17).

Contentious Arguments (*eristikoi logoi*): "Those that deduce or appear to deduce from what appear to be acceptable beliefs, but are not" (*SE* 165^{b}7–8).

Contiguous (*echomenon*): "Successive and making contact" (*Met*. 1069^{a}1–2).

Continuous (*suneches*): "Two things are continuous when the limits of each, by which they make contact and by which they are kept together, become one and the same" (*Met*. 1069^{a}5–7).

Contradiction (*antiphasis*): "A contradiction is an opposition in which there is intrinsically no intermediate" (*APo*. 72^{a}12–13; also *Met*. 1011^{b}23–24).

Contrary (*enantios*): (1) "Said to be contraries are: Those things differing in kind that cannot belong to the same thing at the same time. The most different of the things in the same kind. The most different of the things in the same recipient. The most different of the things falling under the same capacity. The things whose difference is greatest either unconditionally or in kind or in form" (*Met*. 1018^{a}25–31; also 1055^{b}13–17). (2) "Contraries are affected by, and affect, each other, and are destructive of each other" (*Cael*. 286^{a}33–34). (3) "Things in the same receptive subject that differ the most are contraries (for the matter for contraries is the same)" (*Met*. 1055^{a}29–30; also *Top*. 113^{a}34–35, *Somn*. 453^{b}27–29). (4) "Contraries cannot belong to the same thing at the same time" (*Met*. 1011^{b}17–18). See **Opposite**

Control, Having: See *Kurios*

Convention: See **Law**

Convert (*antistrephein*): *Antistrephein* is used to signify the following: (1) A logical relation between propositions, so that the universal negative converts, because if no B is A, then no A is B (*APr*. 25^{a}5–6), and so on. (2) A logical relation between terms (51^{a}4–5), equivalent to counterpredication (*Top*. 102^{a}19). (3) The substitution of one term for another, without logical convertibility (*APr*. 64^{a}40). (4) The (valid) inference of (A admits of not being B) from (B admits of being A) (32^{a}30). (5) The substitution of the opposite of a premise for a premise (59^{b}4). (6) An argument in which from one premise in a syllogism, and the opposite of the conclusion, the opposite of the other premise is deduced (*APr.* 2.8–10, *Top*. 163^{a}32–34). (7) At *Top*. 109^{a}10, and only there it seems, A and B convert if and only if (B *belongs* to A) implies (A *is* B). (8) At *GC* 328^{a}19, however, conversion seems to be affective reciprocity, so that A and B convert if and only if A affects and is affected by B and vice versa. (9) At *Somn*. 456^{b}21 it refers to the "turn" of the tide.

Co-ordinates (*sustoicha*): See **Column**

Cotyledons (*kotulêdones*): Pits in the modified wall of the uterus into which fit the villi of the outside membrane of the embryo. The name derives from the suckers on the arms of cuttlefish.

Courage (*andreia*): Discussed in *NE* 3.6–9, *EE* 3.1. See **Virtue**

Craft (*technê*)

The focal, but not the most helpful, discussion is *NE* 6.4. A craft is a science that is neither practical (concerned with action) nor theoretical (concerned with truth) but productive: "From craft the things whose form is in the soul come to be (and by 'form' I mean the essence of each thing and the primary substance). . . . Of comings into being and movements, one part is called 'understanding' and the other 'producing'—what proceeds from the starting-point and form is understanding, what proceeds from the final stage of understanding is producing" (*Met*. 1032^{a}32–^{b}17).

Aristotle distinguishes between different levels of craft knowledge and, correlatively, between craftsmen of different degrees of accomplishment. The lyre player and the good lyre player have the same craft and work, but it is characteristic of an excellent one "to do it well" (*NE* 1098^{a}12). Some craftsmen know all that is in the craft handbook, so to speak, but when it comes to problems that lie outside it, and so require deliberation, they sometimes arrive at reasons that are false (1140^{a}28–30). These people know all the true handbook reasons but not the true deliberative ones. They may be good craftsmen for routine jobs, but, lacking the relevant sort of wisdom, they cannot deal with really hard cases. Other craftsmen are wise in that they are the most exact practitioners of their craft (1141^{a}9–10). They know not just the true handbook and deliberative reasons but the ultimate explanatory ones—those that might be found in the most exact treatises on the craft's starting-points. What distinguishes "those doctors who pursue their craft in a more philosophical manner" is that their search for the "primary starting-points of health and disease" (*Sens*. 436^{a}17–^{b}1) leads them to begin by considering nature in general (also *Juv*. 480^{b}21–30).

This third class is that of the architectonic craftsmen, who, because they know the ultimate explanatory starting-points, have the most control, the most authority, and political science seems to be "the most architectonic one" (*NE* 1094^{a}27). Hence, "strictly speaking, the ones who above all do actions, even external actions, are the architectonic craftsmen who do them by means of their thoughts" (*Pol*. 1325^{b}21–23). When Aristotle says that "craft does not deliberate" (*Ph*. 199^{b}28), he means that a craft, insofar as it is exact, fully developed, and self-sufficient, does not do so (*NE* 1112^{a}34–^{b}1).

Craft imitates nature (*Ph*. 194^{a}21–2, *Mete*. 381^{b}6) and nature's operations are often analogized to those of craft (*GA* 730^{b}11–23), to which is assigned the completion of things that nature is "incapable of bringing to completion" (*Ph*. 199^{a}16; also F90 50.1). The products of crafts are substances (190^{b}6), but as not composed by nature, they are not substances of the most canonical or primary sort (*Met*. 1041^{b}28–29, 1043^{b}21–23).

Unlike virtues, crafts can be used to achieve either good or bad ends (*Met*. 1046^{b}4–24, 1048^{a}8–11, *NE* 1106^{a}6–9, 1140^{b}22–23, *Rh*. 1355^{b}2–7).

Craft Incompetence (*atechnia*): The cognitive condition of someone who pretends to have craft knowledge and gives false craft reasons. It is not mentioned except at *NE* 1140^{a}21, although the quality of being *atechnos* is mentioned many times.

Craftsman (*technitês*): The term *technitês* is often accompanied in Aristotle by the term *banausos* ("unrefined"), as at *Pol*. 1258^{b}26, which can be a near synonym of *phaulos* ("base"). Though such craftsmen are somewhat free and somewhat enslaved, they seem to be further removed from virtue than slaves are (*Pol.* 1260^{a}39–^{b}1). Yet nothing in their nature fits them to do the work they do (1260^{b}1–2). Instead, it seems to be their work itself that prevents them from acquiring virtue and being happy (1337^{b}4–21), suggesting that if they had not become unrefined craftsmen, they might (other things being equal) have been capable of virtue. They are typically distinguished from farmers, tradesman, hired laborers (1289^{b}32–33, 1317^{a}24–26), free people (1340^{b}9–10), and hoplites (1326^{a}23), and grouped together with wage earners (1337^{b}13–14). At the same time, crafts themselves are ranked in their level of lack of refinement, with "the most unrefined, [being] those in which the body is most damaged; the most slavish, those in which the body is used the most; the most ill-bred, those least in need of virtue in addition" (1258^{b}37–39). At *SE* 168^{b}6, however, we find the phrase "the craftsmen and scientists generally," which suggests that the craftsmen being linked to philosophers at *Rh*. 1397^{b}23–24 are the more scientific ones, such as doctors, rather than handicraftsmen. At *Div. Somn.* 463^{a}5–7 "sophisticated doctors" are referred to as craftsmen.

Crook-taloned: *Gampsônux*

Crumbly (*psathuron*): When applied to liquids, "non-viscous."

Cuttlefish: *Sêpia*

Cynicism (*kakoêtheia*): "Taking everything in the worst way" (*Rh*. 1389^{b}20–21). As applied to animals—or sometimes to people—*kakoêthês* means "has a bad character" (*HA* 613^{b}23).

Daimonic (*daimonios*): What is *daimonios* is either "a god or the work of a god" (*Rh.* 1398^{a}16); a substantive *daimôn* is either a god or the child of a god (1419^{a}8–12). Nature is *daimonios* (*Div. Somn.* 463^{b}14), as are religious matters (*NE* 1122^{b}21, *Pol.* 1322^{b}21), and the things that theoretically wise people know (*NE* 1141^{b}7). Luck (*Ph.* 196^{b}7), dreams (*Somn*. 453^{b}23–24), and false pregnancies (*HA* 636^{a}24) merely seem to be *daimonios*.

Daktulos: **Finger**

Dancing (*orchêsis*): "The craft of dancers makes use of rhythm only, without harmony—for these people too, through the rhythms that are shaped [into movements], produce imitations of characters, feelings, and actions" (*Po*. 1447^{a}26–28).

Death (*thanatos*): The destruction of vital heat (*Juv*. 469^{b}19–20).

Decency, Decent (*epieikeia*, *epieikês*): (1) *Epieikês* is sometimes used interchangeably with *agathos* ("good") (as at *NE* 1137^{b}1, 1168^{a}33, 1172^{b}11). (2) When contrasted with ordinary people (*hoi polloi*), the *epieikês* is usually the one who is better off and more respectable (1167^{b}1), but not always (*Ath*. 26.1). (3) What makes someone *epieikês*, in the ethical sense, is that he is fair-minded and considerate of others (*NE* 1143^{a}21–24), so that someone who is *epieikês* is characterized in particular by an attitude to legal justice that pays more attention to fairness than to the letter of the law (1137^{b}34–1138^{a}3). As a result, *epieikeia* is close in meaning to our "equity."

Decree (*psêphisma*): A law is a relatively permanent enactment, universal in scope, and applicable on many different occasions. A decree is an enactment, adapted to particular circumstances (*NE* 1137^{b}27–32), stating what is to be done in a particular case, and so is the last thing reached in a piece of practical deliberation (1141^{b}27–28, 1151^{b}14–16). The political liabilities of government by decree rather than law are discussed at *Pol*. 1292^{a}6–37.

Deduction (*sullogismos*)

To understand what a deduction is, we must begin with the sorts of statements or propositions that are its premises and conclusion. A statement (*logos apophantikos*) is the true (or false) predication of a single predicate term A of a single subject term B, either as an affirmation (*kataphasis*) (A belongs to B) or a denial (*apophasis*) (A does not belong to B) (*Int.* 5, 8). What makes a term a single subject term, however, is not that it is grammatically singular or serves as a grammatical subject but that it designates a substantial particular—a canonical example of which is a perceptible matter-form compound, such as Socrates. Similarly, what makes a term a predicate is that it designates a universal (man, pale)—something that can have many particular instances. When the role of predicate is restricted to universals, therefore, while that of subject is left open to both particulars and universals, it is more on ontological or metaphysical grounds than on what we would consider strictly logical ones. Subjects and predicates are thus ontological items, types of beings, rather than linguistic or conceptual ones, and logical principles, such as the principle of non-contradiction, are very general ontological principles, truths about all beings as such, or qua beings.

Particular affirmations (Socrates is a man) and general affirmations (Men are mortal) have the same subject-predicate form, but when the subject is a universal, the affirmation may itself be either universal (All men are mortal) or particular (Some men are mortal)—that is to say, the predicate may be asserted (or denied) of the subject either universally (*katholou*) or in part (*kata meros*) or, if the quantifier is omitted (Men are mortal), indeterminately (*adihoristos*). Affirmations, as a result, are of four types: A belongs to every B (aAB), A belongs to no B (eAB), A belongs to some B (iAB), A does not belong to every B (oAB).

"A deduction is an argument in which, certain things having been assumed, something different from the things assumed follows of necessity in virtue of their being so" (*APr.* 24^{b}18–20). It consists of a major premise, a minor premise, and a conclusion,

where the premises have exactly one "middle" term in common, and the conclusion contains only the other two "extreme" terms. The conclusion's predicate term is the *major term*, contributed by the major premise; its subject is the *minor term*, contributed by the minor premise. The middle term must be either subject of both premises, predicate of both, or subject of one and predicate of the other. The resulting possible combinations of terms yield the so-called figures of the syllogism:

	First Figure		Second Figure		Third Figure	
	Predicate	Subject	Predicate	Subject	Predicate	Subject
Premise	A	B	A	B	A	C
Premise	B	C	A	C	B	C
Conclusion	A	C	B	C	A	B

Systematic investigation of the possible combinations of premises in each of these figures results in the identification of the *moods* or modes that constitute valid deductions. In the first figure, these are as follows:

Form	Mnemonic	Proof
aAB, aBC| aAC	Barbara	Perfect
eAB, aBC| eAC	Celarent	Perfect
aAB, iBC| iAC	Darii	Perfect
eAB, iBC| oAC	Ferio	Perfect

A mood is perfect when there is a proof of its validity that is *direct*, in that it does not rely on the validity of any other mood. Only first figure syllogisms have perfect moods.

Besides their logical interest as admitting of direct proof, perfect syllogisms in Barbara are also of particular importance to science. First, because "among the [syllogistic] figures, the first is most scientific" (*APo.* 79^{a}17–18). Second, "only through this figure is it possible to hunt down scientific knowledge of the what-it-is" (79^{a}24–25): essences hold universally, only perfect syllogisms in Barbara have universal conclusions, and definitions of essences, which are scientific starting-points, must hold universally.

Practical deductions are mentioned at *NE* 1144^{a}31–32 and discussed there, at 1147^{a}25–^{b}3 (involving lack of self-control), *DA* 434^{a}16–21, and *MA* 7. A productive example is given at *Met.* 1032^{b}6–9. See **Deliberation**; **Science**

Deduction, Contentious (*eristikos sullogismos*): "A contentious deduction is one that proceeds from what appear to be, but are not, acceptable beliefs, or an apparent deduction from what are, or what appear to be, acceptable beliefs; for not everything that appears to be an acceptable belief actually is one" (*Top*. 100^{b}23–26).

Deduction, Dialectical (*dialektikos sullogismos*): "A deduction is dialectical when it deduces from acceptable beliefs" (*Top*. 100^{a}29–30). In a dialectical encounter it is what lies behind a questioner's questions, partly dictating their order and content, and partly determining the strategy of his attack.

Define, Definition (*horizein*, *horismos*, *horos*): (1) "One sort of definition is an indemonstrable account of the what-it-is; another is a deduction of the what-it-is, differing in inflection from a demonstration; a third is the conclusion of a demonstration of the what-it is" (*APo*. 94^{a}11–14). (2) "A definition is an account that signifies the essence" (*Top*. 101^{b}38). (3) "A definition is composed of a kind and a difference" (103^{b}15–16; also *Met*. 1037^{b}29–30). (4) "The ultimate difference will be the substance of the thing and its definition" (*Met*. 1038^{a}19–20). (5) "A definition is a sort of number; for it is divisible, and indeed into indivisibles (for the accounts are not unlimited), and number is like that" (1043^{b}34–36). (6) "One sort [of definition] will be an account of what a name, or some other name-like account, signifies" (*APo*. 93^{b}30). Both sorts of definitions say what something is, but do not assert that it is (72^{a}21–24). (7) "Every definition is always universal" (97^{b}25). (8) "In a definition nothing is predicated of anything else" (90^{b}34–35).

Defining Mark (*horos*): A common meaning of the noun *horos*, from which verb *horizein* ("define") derives, is "term," in the logical sense in which a syllogism has three terms. But often a *horos* is a definition or a defining mark (a boundary marker is a *horos*) that gives—often perceptible—definition to what would otherwise lack it (*Pol*. 1258^{a}18, 1267^{a}29, 1326^{a}35). Hence the doctor's *horos* is the thing "by reference to which he judges what is a healthy body and what is not" (*EE* 1249^{a}23–24). The *horos* of health in a muscle might be a certain uniform or smooth state, which the doctor can detect by touch (*Met.* 1032^{b}6–10), or that of fever in a patient, his visible paleness (†*MM* 1208^{a}23–30).

Deformation, Disability (*pêrôma*): A *pêrôma* has an effect on functioning and may be part of a thing's nature: femaleness is "like a natural deformation" (*GA* 775^{a}15–16), negatively affecting the ability to reproduce (728^{a}18–21), while the seal's lack of ears, also a natural deformation, is advantageous to it (781^{b}22–28). But someone may be *pêros* ("blind") not by nature but simply as a result of an accident or a condition such as drunkenness (*NE* 1114^{a}25).

Deiktikos: **Probative**

Deinos: **Clever**

Dektikos: See **Recipient, Primary**

Deliberate Choice (*prohairesis*): (1) Choosing (*haireisthai*) one thing before or in preference to (*pro*) another (*NE* 1112^{a}16–17), and so deliberating about what things should be done earlier than or in preference to others in order to further a desired end: "it seems characteristic of the person with understanding to choose the better of two things

in every case" (*EE* 1237^{b}36–37). (2) "The objects of deliberation and of deliberate choice are things that further the end" (*NE* 1113^{b}3–4).

Deliberation (*bouleusis*)

Bouleusis has a broad sense and a narrow sense. In the broad sense, a craftsman—such as a doctor, navigator, or physical trainer—can deliberate about what to do when his craft does not provide explicit directions (*NE* 1112^{a}34–^{b}9, *EE* 1227^{a}20–21). In the narrow sense, the "unconditionally good deliberator . . . is the one capable of aiming at and hitting, in accord with rational calculation, the best for a human being of things doable in action" (*NE* 1141^{b}12–14), so that deliberation of this sort is exclusively a practical or action-related matter. In either sense, "we deliberate not about ends, but about the things that further ends" (1112^{b}11–12).

Like reasoning in the broadly theoretical sciences, deliberation is "like a sort of deduction" (*Mem*. 453^{a}14). But while theoretical deductions have a propositional conclusion, practical ones conclude in an action: "if everything sweet should be tasted and this (as one of the particulars) is sweet, it is necessary for the person who is able and not prevented also to do it at once" (*NE* 1147^{a}29–31). But, though the conclusion of a practical or deliberative deduction is an action, the last thing reached in deliberation is not an action but a decree: "a decree is doable in action, as the last thing" (1141^{b}27–28). Conclusion and last thing, though easily confused, are thus not the same. It is "the final premise," as a belief about something perceptible and doable in action, that controls actions (1147^{b}9–10). For once the relevant decree is reached, nothing remains except to act on it immediately. And act on it the agent must if he is to be practically wise: "a person is not practically wise by knowing alone but also by being a doer of the action" (1152^{a}8–9). It follows that the conclusion cannot be a decree of any sort but must be an action that makes the (propositional content of the) decree true.

The ultimate end at which we aim in all our actions is the good doable in action: "if there is some end of all the things doable in action, this would be the good doable in action" (*NE* 1097^{a}22–23). So the ultimate or unconditional topic for the practical deliberator is, What in these circumstances constitutes the good doable in action, G? He will have answered it when he finds a middle term F for his deliberative deduction that has the following features: first, doing an action that is F in these circumstances will best further G; second, an F action is one he can do (or begin to do) in these circumstances without doing anything else; third, an F action is one he can tell he is doing on the basis of perception, "when actually doing the thing" (*EE* 1226^{a}39).

A deduction with these major and minor premises need not—and typically will not—embody the entirety of the deliberator's reasoning or inquiry, but it does constitute its focus: it tells him what he is ultimately looking for: a middle term with the requisite features. Nonetheless, to find such a term he may need to find many other things first. Some of these a science or craft may provide, some may be provided by perception, some he may need to find by further deliberating, some will identify external means to his subordinate ends, others their essential components. But all of them will fall under the umbrella of his focal deduction. So that in being the focus of

his deliberation it is also the organizing and unifying principle of his plan of action. It is the complex action implementing this entire unified plan, in turn, that constitutes his acting well, or achieving G.

Because all practical deliberation has a deduction of this kind as its organizing focus, we may take it as our paradigm case and assign it the following schematic form:

Major premise:	Definition of G
Minor premise:	Decree
Conclusion:	Action

Deliberation, as a consequence, will consist in a search for a decree connecting the definition of G to something that can be acted on directly, using perception. That is why just two errors are possible in practical syllogizing: "sometimes they achieve everything that furthers the end, but the end they set up is a base one, and sometimes they make both errors" (*Pol.* 1331^{b}30–34). The formal invalidity of the deduction is omitted, presumably, because it is not a peculiarly deliberative matter. Hence, though it contaminates deliberation, it is not a defect peculiar to it, which it is part of its specific virtue or correctness to avoid, but rather shows "a lack of educatedness in analytics" (*Met.* 1005^{b}3–4).

The error in setting up the end if you are a doctor consists in getting the definition of health wrong: the condition of the body you think is health is not health. If you are an agent, it consists in getting the definition of G wrong: you think that the good doable in action consists in satisfying your appetites or acquiring high honors, but you are wrong. As errors about the essential and necessarily true definitions of universals, which are established inductively, not deliberatively, these too are scientific errors, not specifically deliberative ones. But the second error, which consists in being wrong about what best furthers the end you may have set up quite correctly, is a deliberative one. It is described as reaching the correct end by "a false deduction—that is, reach the thing one should do but not by the means one should, the middle term being false" (*NE* 1142^{b}22–24).

What G in fact is, is determined by our unchangeable nature and work: "perhaps to say that happiness is the best good appears to be something [generally] acknowledged, and a clearer statement of what it is is still required. Maybe, then, this would come about if the work of the human being were grasped" (*NE* 1097^{b}22–25). Hence the definition of it that serves as a deliberative deduction's major premise is itself fixed and unchangeable—which is another reason we cannot deliberate about it. Its being so, in fact, is an essential condition of the deduction itself being practical or action determining. This is so because for something to produce movement it has to have a ball-and-socket-like structure (*DA* 433^{b}22–27), in which something is fixed (the socket, the definition of G, and the understanding's scientific knowledge of it) and something else moves (the ball, the practical deduction's minor premise). The scientific knowledge of the universal premise cannot change, since it is a state whose object is a necessary truth concerning the relations between the universals F and G. So by nature it remains

fixed from situation to situation. Which particular action will be F and which particular person will be such as to be able or required to do it, on the other hand, do change from one situation to another.

Dêloô: The verb *dêloô* means "make clear," "make known," "disclose," "reveal," and is sometimes used as an equivalent of *sêmainein* ("signify"). "Indicate" sometimes seems to best capture its meaning, especially in *Top*. and *SE*.

Delphian Knife: Apparently, a multipurpose tool of some sort.

Dêmagôgos: **Popular Leader**

Deme (*dêmos*): See **Tribe**

Democracy (*dêmokratia*)
Democracy, which is the most moderate of the deviant constitutions (*Pol*. 1289^{b}4–5), is a deviant form of polity. For, unlike the latter, where the many rule for the common advantage, a democracy is rule of the many "for the advantage of the poor" (1279^{b}8–9). But this definition captures its essence only coincidentally (1279^{b}34–38), since democracy is unconditionally the rule of the poor for the sake of the poor (1280^{a}2–3), and so of the free for the sake of the free. For "in freedom all share" (1280^{a}5; also 1290^{a}40–^{b}3), and "the hypothesis of the democratic constitution is freedom" (1317^{a}40–41).

Such rule, however, comes in a number of different varieties, which Aristotle distinguishes in different (and not obviously equivalent) ways: (1) At *Pol*. 1306^{b}20–21, he distinguishes between (1a) democracy based on law and (1b) one in which the people have complete control. (2) At 1291^{b}30–1292^{a}38 he distinguishes five forms of democracy: (2a) the rich and the poor are equal by law and neither has control; (2b) offices are filled on the basis of a low property assessment; (2c) all uncontested citizens share in the constitution and the law rules; (2d) all citizens (contested or uncontested) share and the law rules; (2e) the same as (2d) except the citizens, not the laws are in control. (2a–d) are presumably sub-varieties of (1a), whereas (2e) is identical to (1b). (3) At 1292^{b}22–1293^{a}12, on the other hand, just four forms of democracy are listed, which seem to correspond to (2b–e).

This list, like the one given in 6.4, omits (2a), perhaps because it combines elements of democracy (rule by the many) and oligarchy (rule by the few) and so is more of a polity than a democracy. Distinctions here are somewhat fluid, as Aristotle recognizes (*Pol*. 1293^{b}33–38). The recipe given at 1319^{a}39–^{b}1 for constructing the various forms of democracy, which is based on the various sorts of common people distinguished at 1290^{b}39–1291^{a}10, does not seem to result in (2b–e) in any obvious way.

Dêmokratia: **Democracy**

Demonstration (*apodeixis*): See **Science**

Demonstration by Reducing to the Impossible: Usually now referred to as *reductio ad absurdum*.

Dêmos: **People**

Denial (*apophasis*): See **Affirmation**

Dense (*puknos*): See **Condensation and Rarefaction**

Denunciation (*endeixis*): A legal action (*Ath*. 29.4, 52.1, 63.3) distinguished by the fact that the prosecutor could arrest the defendant and put him in the public prison to await trial. See **Indictment**; **Writ**

Desire (*orexis*): "Desire comprises appetite, spirit, and wish" (*DA* 414^{b}2–3; also *EE* 1223^{a}27–28).

Diagram (*diagramma*): A *diagramma* is (1) a diagram or figure (*Cat*. 14^{a}38–^{b}1); (2) the construction of such a figure as part of a demonstration (*Met*. 998^{a}25, 1051^{a}22, *NE* 1112^{b}21).

Diaitêtês: **Arbitrator**

Diakrisis: **Disaggregation**

Dialectic (*dialektikê*): A problem (*problêma*) is posed: Does B belong to A, or not? The answerer must answer yes or no. The questioner must refute him by asking questions—by offering him premises to accept or reject. The questioner succeeds if he forces the answerer to accept a proposition contrary to the one he undertook to defend (*SE* 165^{b}3–4). The questioner fails if the answerer always accepts or rejects premises in a way consistent with that proposition. To a first approximation, dialectic is the capacity that enables someone to play the role of questioner or answerer successfully (*Top.* 100^{a}18–21, 164^{b}2–4). It is focally discussed in *Top.* and *SE*, with useful additions at *Int*. 22^{b}22–30, *APr*. 24^{a}16–^{b}15, 46^{a}3–30, 64^{b}28–65^{a}25, 68^{b}8–37 *APo*. 72^{a}8–11, 77^{a}26–35, 77^{b}34–78^{a}13, 81^{b}18–23, 97^{b}37–39, *Ph*. 184^{b}25–185^{a}20, *GC* 316^{a}5–14, *DA* 402^{b}16–403^{b}16, *GA* 747^{b}27–748^{a}16, *Met*. 995^{b}18–25, 1004^{b}10–26, 1005^{b}5–25, 1029^{b}1–1030^{b}13, 1061^{b}8–11, 1078^{b}17–30, *NE* 1145^{b}2–7, 1146^{a}21–27, *Rh*. 1354^{a}1–1355^{b}22, 1356^{a}25–1358^{a}35, 1359^{b}2–16. See **Logico-linguistic**

Dialectical Arguments: "Those that deduce from acceptable beliefs in a way that reaches a contradiction" (*SE* 165^{b}3–4).

Dialectical Premise (*protasis dialektikê*): "A dialectical premise is one to which it is possible to answer yes or no" (*Top*. 158^{a}15–17).

Dialektos: **Speech**

Dianoia: **Thought**

Diaphora: See **Kind**

Diaphragm (*diazôma*, *hupozôma*): The division between the thorax and the abdomen, which is the diaphragm proper in mammals, and its analog in other animals, such as the waist in insects. Also called the "midriff (*phrenes*)." It is discussed in *PA* 3.10.

Diastêma: **Dimension**

Diastrephein: **Distort**

Diathesis: **Disposition**

Diazôma: **Diaphragm**

Dictator (*aisumnêtês*): Holder of an elective tyranny that is in accord with law.

Didactic Arguments (*didaskalikoi logoi*): "Those that deduce from the starting-points proper to a given subject and not from the beliefs of the answerer (for the learner must take things on trust)" (*SE* $165^{b}1$–3).

Didaskalikê: **Teaching**

Difference (*diaphora*): See **Kind**

Dignity (*semnotês*): "A mean between surliness and being ingratiating" (*EE* $1233^{b}35$–36).

Dikaiosunê: **Justice**

Dikastês: **Judge**

Dimension, Interval (*diastêma*): A *diastêma* in music is an interval and, in spatial magnitudes, a dimension (*Ph*. $209^{a}4$). By extension, just as there are extreme and middle terms in a syllogism, so syllogisms themselves are *diastêmata* or intervals connecting the minor term to the major term (*APr*. $42^{b}10$), while premises are sub-intervals of those intervals, so that *protasis* ("premise") and *diastêma* can be equivalent ($26^{b}1$). Terms, as sub-intervals of those sub-intervals, are also *diastêmata*, so that the number of terms in a sequence of syllogisms is equal to the number of *diastêmata* in them ($42^{b}1$–26).

Disaggregation (*diakrisis*): "The aggregating of things of the same kind; for this results in removing what is alien" (*GC* $329^{b}27$–29).

Discern, Judge (*krinein*): Judging typically involves reasoning of some sort (*Met*. $995^{b}3$, $1009^{b}2$, $1063^{a}13$); discerning, as when the perceptual modalities even of non-rational animals discern colors, flavors, and the like (*DA* $418^{a}14$, $424^{a}5$, $427^{a}20$, $428^{a}3$), does not.

Disposition (*diathesis*): "The arrangement of what has parts with respect either to place or capacity or form; for it must be some sort of position, as the name 'dis*position*' also indicates" (*Met*. $1022^{b}1$–3).

Dissections (*Anatomai*): Diogenes Laertius 5.25 (102) mentions a seven-book *Dissections*, which is no longer extant. Aristotle often refers to it, especially in the biological treatises. See 98^{a}2, 456^{b}2, 474^{b}9, 478^{b}1, 483^{b}24, 497^{a}32, 509^{b}23, 511^{a}13, 525^{a}8, 529^{b}19, 530^{a}31, 565^{a}12, 566^{a}15, 650^{a}31, 666^{a}9, 668^{b}29, 674^{b}16, 677^{a}9, 746^{a}22, 35, 680^{a}1, 684^{b}4, 689^{a}18, 696^{b}14, 719^{a}10, 740^{a}23, 746^{a}14, 771^{b}32, 779^{a}8.

Distinctness (*heterotês*): "Difference is not the same as distinctness. For the distinct and what it is distinct from are not necessarily distinct in some respect (for whatever is a being is either distinct or the same), but the different is different from something in some respect, so that it is necessary for there to be something that is the same whereby they differ. And this thing that is the same is kind or form; for all things that differ, differ either in kind or in form—in kind if the things do not have their matter in common and if there is no coming to be from one to the other . . . and in form if they have the same kind" (*Met.* 1054^{b}23–30).

Distort (*diastrephein*): Distortion is often of the sort that feelings generally produce because of their involvement with pleasure and pain: (1) "The pleasant and painful do not destroy or distort every sort of supposition (for example, that triangles do or do not contain two right angles) but the ones about what is doable in action" (*NE* 1140^{b}13–16). (2) "Depravity produces distortion and false views about practical starting-points" (1144^{a}34–36). (3) "Spirit distorts [the judgment of] rulers even when they are the best men" (*Pol.* 1287^{a}31–32). That is why to correct these distortions and produce a virtuous mean in our feelings we must investigate "what we ourselves are more inclined toward; for different people are naturally inclined toward different things. This will become known to us from the pleasure and pain that the things bring about in us. And it is in the contrary direction that we must drag ourselves off; for it is by pulling well away from error that we will attain the mean—precisely as people do in rectifying distorted pieces of wood" (*NE* 1109^{b}1–7).

Dithyramb (*dithurambos*): Hymn to the god Dionysus (Bacchus).

Division (*diairesis*): A way of defining what something is by dividing its kind and differences in the way specified at *Met.* 1037^{b}27–1038^{a}20. Specifically Platonic division, however, is often criticized.

Docked (*kolobos*): The adjective *kolobos* means "docked" (as in docking a puppy's tail or docking someone's salary), "curtailed," "stunted," "truncated"—the central idea being that of cutting off a projecting part, typically a non-essential one. None of these English terms fits all the cases Aristotle cites in his discussion of the notion in *Met.* 5.27. "Mutilated" is the traditional translation but suffers the disadvantage of not capturing the central idea: mutilation need not involve the cutting off of a part; cutting off a part need not result in mutilation. Nonetheless, it sometimes gives the correct sense, as at F135. At *SE* 176^{a}40, a question asked *kolobôs* is contrasted with one asked in a perspicuous way.

Dog Days: The sultry days of July and August, so-called because they were associated with the Dog Star (Sirius).

Dokimasia: **Examination**

Dorian: See **Harmonies**

Double Game, Play a (*epamphoterizein*): (1) The verb *epamphoterizein* is used to characterize ambiguous statements (Plato, *Republic* 479c) and to describe things that lie halfway between others. (2) In a related sense, water and air *epamphoterizein* because they have tendencies to move up and to move down (*Ph*. 205^{a}28); some animal kinds do so because they both walk and swim, or walk and fly (*HA* 488^{a}1), while others, like humankind, do so because they are "one-offspring-bearing, few-offspring-bearing, and many-offspring-bearing at times" (*GA* 772^{b}1–2); and some qualities do so due to their nature, because of "going toward the worse or toward the better because of one's habits" (*Pol*. 1332^{b}2–3).

Doulos: **Slave**

Doxa: **Belief**

Dream (*oneirôttein*): "The appearance due to the movement from the perceptual affections, when it occurs during sleep, and insofar as one is sleeping" (*Insomn*. 462^{a}30–31.

Drimus: **Pungent**

Dry (*xêros*): "Things are said to be dry and wet in many ways; for both wet (*hugros*) and moist (*dieros*) are opposed to dry, and, in turn, both dry and solid (*pepêgos*) are opposed to wet; but all these belong to the wet and the dry said in the primary way. For since dry is opposed to moist, and moist is what has alien liquid on its surface, while soaked is what has it to its depths, and dry is what is deprived of it, it is evident that moist will belong to the wet, and the dry that is opposed to it to what is dry in the primary way. Again, wet and solid are opposed in the same way; for wet is what has its own liquid down to its depths (while soaked is what has alien liquid down to its depths), and solid is what is deprived of this, so that these too belong, the one to the dry, the other to the wet" (*GC* 330^{a}12–24). *Hugros* is generally "wet," or "liquid," even when "moist" or "moisture" might seem more natural; and *xêros* as "dry," not "solid."

Duct (*poros*): No English word matches Aristotle's use of *poros* perfectly in every context. But because the notion is an important one it requires consistent handling. Overall "duct" seems to work better than "passages," "pores," "channels," and so on, though these give a more natural reading in some cases. The term occurs rarely in the short psychological works (*Sens*. 438^{b}14, *Somn*. 457^{a}13, 26, ^{b}13, *Juv*. 473^{b}3, 480^{b}16), and only once in *DA* (at 422^{a}3). Nonetheless, the connection of perceptual organs to the heart is firm doctrine there (*Sens*. 439^{a}1–2, *Juv*. 469^{a}2–23) as elsewhere (*PA* 647^{a}24–31, 656^{a}27–29). At *GC* 326^{b}34–327^{a}1 ducts are "veins of affectability, just like [veins of ores] stretching continuously in mines."

Dunamis: See **Capacity**

Dunatos: See **Possible**

Dynasty (*dunasteia*): "The counterpart among the oligarchies of tyranny among the monarchies, and of the democracy we spoke of last among the democracies" (*Pol.* 1292^{b}7–9).

Earth (*gê*): See **Element**

Earth, the: Discussed in *Cael.* 2.13–14.

Echein: **Having**

Eclipse (*ekleipsis*): Defined at *APo.* 90^{a}15–17; explained at 93^{a}29–^{b}14 (also *Cael.* 297^{b}29–30).

Ecstatic (*enthousiastikos*): *Enthousiasmos*, which derives etymologically from *theos* ("god"), is a state similar to the feeling of ecstatic possession experienced by a participant at the orgiastic feasts of Dionysus (Bacchus), and other such gods, at which intoxicating music, like that of Olympus, figured. See *Pol.* 1340^{a}11, ^{b}4, 1342^{a}4.

Education (*paideia*)
Aristotle thinks that education is of paramount political importance (*Pol.* 1310^{a}12–14, 1332^{b}10–11): a community could not really be a city if it did not educate its citizens in virtue (1280^{b}1–8); people are unified and made into a community by means of education (1263^{b}36–37). Yet, in part because the *Politics* is incomplete (see 1326^{b}32–39, 1330^{a}31–33, 1335^{b}2–5, 1336^{b}24–27, 1338^{a}32–34, 1341^{b}19–23), it is difficult to get clear even about the elementary education described there (7.17–8.7). Four stages are discernible in it: (1) The treatment of infants, and their informal training up to the age of 5 is sketchily described at 1336^{a}3–1336^{b}35. (2) From ages 5 to 7, children observe the studies they will later learn for themselves (1336^{b}35–37). (3) From ages 7 to 14, which includes "lighter athletic exercises" (1338^{b}40–42). (4) From ages 14 to 21, this includes (ages 17 to 21) arduous physical training combined with a strict diet (1339^{a}5–7), as well as three years (ages 14 to 17) of "other sorts of learning" (1339^{a}5). But these are not explicitly identified. They could be reading and writing, music, and drawing (1337^{b}24–25). But then the only thing that children would be taught in (3), a period of seven years, is light physical training. This is sufficiently implausible on its own terms (why postpone reading, writing, drawing, and music until age 14?) and a sufficiently large departure from common Greek practice and Plato's recommendations that we would expect Aristotle to acknowledge it as an innovation and defend it carefully. The fact that he does neither of these things suggests that he is in fact intending to follow tradition and include reading, writing, drawing, and music in (3).

But if the "other sorts of learning" are not reading, writing, music, and drawing, what are they? There are a number of possibilities. In *Pol.* 1.11, Aristotle says that a free

person has theoretical knowledge of all of the practical aspects of wealth acquisition (1258^{b}9–11). And in various places, he refers to what he calls a "well-educated person (*pepaideumenos*)." This is someone who studies practically all subjects—including analytics (*Met.* 1005^{b}3–4)—not in order to acquire expert scientific knowledge in all of them (which would be impossible), but in order to become a good judge (*PA* 639^{a}1–6, *Met.* 995^{a}6–14, *NE* 1094^{b}28–1095^{a}2, *EE* 1216^{b}40–1217^{a}10). Generally educated in, e.g., medicine, he is as capable of judging whether or not someone has treated a disease correctly as a doctor is (*Pol.* 1282^{a}3–7). Acquainted with many subjects, methodologies, and areas of study, he knows "what we should and should not seek to have demonstrated" (*Met.* 1006^{a}6–8) and looks for "the degree of exactness in each kind of investigation that the nature of the subject itself allows" (*NE* 1094^{b}23–27).

Because he is able to judge the works and advice of experts, a well-educated person is free from the sort of intellectual enslavement to them that would otherwise be his lot. He knows who is and who is not worth listening to on any matter and so can get good expert advice when he needs it. But he is also free from the inner enslavement that is all too often the lot of the narrow expert, whose imagination is straitjacketed by the one thing he knows too well. For, while he has indeed studied all the "free sciences," he has done so only "up to a point," and not so assiduously or pedantically as to make "thought unleisured and low" (*Pol.* 1337^{b}14–17). Presumably, then, the citizens of the best city, who are all civilized and generally educated men, must be trained in these subjects at some point. If not as part of (3), then later in their lives.

In *Pol.* 8.3, we are promised a discussion of a sort of education that sons should be given "not as something useful or necessary but as something noble and free" (1338^{a}30–34). The promise is unfortunately not fulfilled, but we do nevertheless have some clues to go on as to the nature of these studies. We know that music and drawing are both to be taught in part because they are noble and free and contribute to leisure (1338^{a}21–22, 1338^{b}1–2). But we also know that many other subjects, particularly philosophy (1263^{b}29–40, 1267^{a}10–12, 1334^{a}23) and other theoretical sciences, are crucial to spending one's leisure time well and achieving happiness. Since the end of a city is to enable its citizens to lead the good life and be happy, it must surely educate them in these subjects and sciences (see 8.15).

Finally, there is the vexed question of explicitly ethical or political training and education. Ethical training (in the shape of habituation) must take place before more formal education in ethics and statesmanship (e.g., listening to Aristotle's own lectures on ethics in the Lyceum) can begin (*NE* 1095^{b}4–8). *Pol.* 1336^{a}23–34 suggests that some of this already occurs in (1). Formal ethical education is absolutely required, however, in order to develop practical wisdom (which includes the knowledge of what happiness really is), which all the citizens of the best city must have if they are to rule successfully when their turn comes (*Pol.* 1277^{b}26). Such education presumably takes place after (4), but precisely when and in what form, we can only guess (see *Pol.* 1333^{b}3–5). Moreover, we know that training in rhetoric is very important (*Rh.* 1355^{a}39–^{b}2), suggesting that it too is part of general education. It seems reasonable to conclude, therefore, that some

training in the theoretical sciences must be included in (1)–(4) in addition to ethical habituation, and that some further education in ethics, rhetoric, and perhaps in these sciences too must occur after (4).

Just as important as the content of the education Aristotle advocates is the fact that he explicitly conceives of it not in the traditional Greek way as privately provided (*Pol*. 1337^{a}18–26) but as public education suited to the constitution and provided to citizens by it (1260^{b}15, 1337^{a}14). It is no surprise, therefore, that most of his remarks about the education provided in the best city concern the education of future unconditional citizens, all of whom are, of course, males. It seems certain, nonetheless, that he thinks that public education should also be provided to girls and women (1260^{b}13–20, 1269^{b}12–24, 1335^{b}11–12). But since he thinks that male and female virtues are different (1.13), the education of men and women is also bound to differ substantially.

Egg (*ô[i]on*): "Among the embryos that are complete, what is called an 'egg' is the one from which the animal offspring comes to be, from one part of which comes the starting-point, while the other is nourishment for the offspring" (*HA* 489^{b}6–8). Two-colored eggs have a white part and a yellow part (*ôchron*) or yolk (*lekithos*, *neottos*); single-colored ones have no difference between white and yolk (*GA* 751^{a}31–33).

Egkuklia: **Works in Circulation**

Eidenai: **Know**

Eidôlon: **Image**

Eidos: **Form**

Eikos: **Likelihood**

Einai: **Being**

Einai + dative: **Being for**

Eirôn: **Self-deprecator**

Eisaggelia: **Indictment**

Ekklêsia: **Assembly**

Ekkrisis: See **Secretion**

Ekthesis: **Setting Out**

Elegant (*asteios*): The urban center of a *polis* is the *astu* ("city proper") in contrast to the surrounding countryside. Someone is *asteios*, then, when he is "urbane" and "well educated" rather than *agroikos* ("rustic," "boorish"). On the other hand, someone who is *asteios* is also contrasted with someone who is noble in appearance, and likened to one who is well proportioned (*NE* 1123^{b}7–8). "Elegant" rather than "urbane" seems to better capture the sense.

Elegchos: **Refutation**

Element (*stoicheion*): A *stoicheion* was originally one of a row (*stoichos*) of things and later a letter of the alphabet or an element of any complex whole (Plato, *Theaetetus* 201e). Aristotle uses it in these ways, and to refer to the five primary bodies (earth, water, air, fire, and ether or "primary body") from which all others are composed (*Cael*. 302^{a}15–19). These, however, though called "elements," may not in fact be such, since they are not simple: (1) "Fire . . . and air and each of the others . . . are not simple, but mixed. The simple ones are like these, but not the same as them—for example, if something is like fire, it is fire-form, not fire, and if like air, it is air-form, and likewise in the other cases" (*GC* 330^{b}21–25; also *PA* 649^{a}20–23). (2) "At the center and around the center what is heaviest and coldest is set apart, namely, earth and water. Around these, and continuous with them, are air and what due to custom we call 'fire,' but it is not fire. For fire is excess of hotness and a sort of boiling. But we must understand that of what we call 'air,' the part surrounding the earth is, as it were, wet and hot because it is vaporous and contains exhalations from the earth, while the part above this is already hot and dry. For vapor's nature is wet and cold, that of exhalation hot and dry. And vapor is potentially like water, exhalation potentially like fire" (*Mete*. 340^{b}19–28). (3) In a more special sense, an element is a topic: "I mean the same thing by 'element' and 'topic'; for an element or topic is something into the province of which many enthymemes fall" (*Rh*. 1403^{a}19).

Eleos: **Pity**

Eleutheriotês: **Generosity**

Eleutheros: **Free**

Elleipsis: See **Excess and Deficiency**

Embruon: See **Embryo**

Embryo (*kuêma*): (1) "By [a *kuêma*] I mean the primary mixture of female and male" (*GA* 728^{b}34). The fertilized ovum of live-bearing animals are *kuêmata*, but so too are complete and incomplete eggs (733^{a}24), larvae (758^{a}12, 758^{a}33), fish spawn or roe (741^{a}37), and newborn animal offspring (*HA* 579^{a}21), so that "embryo," which is the usual translation, is no better than an approximation. (2) *Embruon* is "fetus." For *embrua* "necessarily possess heaviness and movement" (*GA* 719^{a}15–16), and so seem to be a later stage in the development of *kuêmata*: "there is a sort of completion even of a *kuêma*" (776^{a}35–^{b}1). But often the two terms are interchangeable.

Empeiria: **Experience**

Empsuchon: **Animate**

Enantion: **Contrary**

Encomium (*egkômion*): "Speech that makes the greatness of virtue apparent" (*Rh*. 1367^{b}26–27).

End (*telos*): (1) "By 'end' we mean not every last thing, but the best one" (*Ph*. 194^{a}32–33). (2) "The best thing and the last thing, for the sake of which all the others [exist], is an end" (*EE* 1219^{a}10–12). (3) "The end—that is, the for-the-sake-of-which—is a last thing" (*Met*. 1021^{b}29–30). (4) "A certain difference . . . appears to exist among ends; for while some are activities, others are works of some sort beyond the activities themselves" (*NE* 1094^{a}3–5).

Enthymeme (*enthumêma*): The correlate in rhetoric of a deduction in dialectic (*Rh*. 1356^{b}3–4).

Entoma: **Insects**

Epagôgê: **Induction**

Epainetos: **Praiseworthy**

Epamphoterizein: **Double Game, Play a**

Epic Poetry (*epopoiia*): Defined and distinguished from tragedy at *Po*. 1449^{b}9–20, 1458^{b}15–19.

Epideictic (*epideiktikon*): A speech made on typically ceremonial occasions where someone or something is either praised or blamed.

Epieikeia, *epieikês*: **Decency, Decent**

Epimeleia: **Supervision**

Epistêmê: **Science**

Epistêton: See **Action, Doable in**

Epithumia: **Appetite**

Equal, Fair (*isos*): Equality, as a matter of justice, is discussed at *NE* 5 and, as a political ideal, at *Pol*. 5.1. The important contrast between numerical equality and equality in accord with worth is discussed at *NE* 5.3, *Pol*. 1301^{b}30–35.

Ergon: **Work**

Eristikos: **Contentious**

Erythrinus (*eruthrinos*): Probably the *Serranus anthias* (a sort of sea perch), which is hermaphrodite, with male organs that are hard to discern.

Eschaton: See **End**

Essence (*to ti ên einai*): *To ti ên einai*—roughly, "the what-it-was-to-be"—is a phrase of Aristotle's coinage, of which "essence," from the Latin verb *esse* ("to be") is the standard translation. The imperfect tense *ên* ("was") may—as in the Latin phrase *quod erat demonstrandum* ("which was to be proved")—stem from an original context (such as a Socratic conversation) in which someone is asked to say or define what X is, and concludes by giving his answer in the imperfect tense to signal that he is giving the answer that was asked for. Apart from that, it seems to have no special significance, so we could equally well translate *to ti ên einai* as "the what-it-*is*-to-be." See **Substance**

Essence, Primary: "The primary essence does not have matter; for it is an actuality" (*Met*. 1074^{a}35–36).

Estimable (*timios*): (1) The core sense of *timios* is captured in the remark that ordinary people "are in the habit of saying that those they particularly esteem and love 'have priority'" (*Cat*. 14^{b}5–7). (2) Something is objectively *timios* when—like starting-points and causes—it "is prior by nature" (14^{b}3–5). (3) To say that something is estimable is thus to ascribe a distinct sort of goodness or value to it: "Happiness is included among things both estimable and complete," since, as "the starting-point and cause of goods," it is "something estimable and divine" (*NE* 1102^{a}1–4). (4) "Those things are estimable on which honor is based, and honor follows along with all such things" (†*MM* 1183^{b}23–24).

Ether (*aithêr*): *Aithêr* is the name given by Anaxagoras (*Cael*. 270^{b}24–25) to what Aristotle calls "primary body" (*sôma prôton*), the element that constitutes the heavenly bodies. It is "beyond the ones composed here, more divine and prior to all these" (269^{a}32), and it is both transparent and in eternal circular movement (270^{a}12–^{b}25).

Ethics (*êthikê*): The methodical inquiry into ethics is "a sort of politics" (*NE* 1094^{b}10–11). But while politics' focus is the good of a city—which, like that of an individual (1094^{b}7–8), is happiness—ethics aims to discover (among other things) what happiness is (*Pol*. 1332^{a}3–10).

Ethnos: **Nation**

Ethos: **Habit**

Êthos: **Character**

Eudaimonia: **Happiness**

Euêmeria: Sometimes "prosperity" (*NE* 1178^{b}33, *Pol*. 1322^{b}38), sometimes "joy" (*Pol*. 1278^{b}29, 1324^{a}38).

Eugeneia: **Breeding, Good**

Eulogos: **Reasonable**

Eunomia: **Good Legislative Order**

Euphuês: **Naturally Well-disposed**

Eupraxia: See **Happiness**

Euthuna: **Inspection**

Evident (*phaneron*, *phainesthai*): See **Appear**

Exact, Exactness (*akribês*, *akribeia*): "One science is more exact than another, and prior to it, if it is both of the that and the why, and not of the that separately from the why; and if it does not have an underlying subject, while the other does have an underlying subject (as, for example, arithmetic is more exact than harmonics); and if it makes fewer assumptions, while the other depends on some additional assumption (for example, arithmetic is more exact than geometry)" (*APo*. 87^{a}31–35). So (1) the most exact version or formulation of a science is the most explanatory one—the one consisting of demonstrations from starting-points; (2) of two sciences, formulated in the most exact way, one is more exact than the other if it demonstrates facts that the other deals with but does not demonstrate. Because a natural science has to posit sublunary matter in addition to such starting-points (*Met*. 995^{a}14–16), the strictly theoretical sciences (theology, astronomy, and mathematics) are more exact than it. Hence it is among these that the most exact one will be found, and it will be the one that explains what the others treat as a fact or undemonstrated posit. *Top*. 111^{a}8–9 offers "perspicuous" as an equivalent.

Examination (*dokimasia*): The process in Athens of determining whether, for example, someone should be admitted to citizenship, or was eligible for military service, or to hold the office to which he had been elected (*Ath*. 42.2, 55.2–3).

Examinational Arguments (*peirastikoi logoi*): "Those that deduce from things that seem so to the answerer and that it is necessary for the one to know who pretends to possess the relevant science" (*SE* 165^{b}4–7).

Examinational Craft (*peirastikê*): "A sort of dialectic and has in view not the person who knows, but the one who is ignorant and pretends to know" (*SE* 171^{b}4–6).

Excellent (*spoudaios*): Often *spoudaios* is a synonym of *agathos* ("good"), but sometimes, when predicated of things, it means "serious" (*NE* 1177^{a}2).

Excess and Deficiency (*huperochê kai elleipsis*): See **More and the Less, the**

Exchange, Craft of (*metablêtikê*): The three parts of the craft of exchange are trading (whose sub-parts are ship owning, transport, and marketing), moneylending, and wage-earning (*Pol*. 1258^{b}20–27). The sorts of exchange that involve bartering surplus goods for other needed goods are natural and are not a part of the craft of wealth acquisition (1257^{a}14–30). The other sorts are parts of the craft of commerce.

Exchange of Property Trial (*antidosis*): A person A assigned a public service could argue that another B was better able to pay its cost. He challenged B in court either to carry out the service in his place, if B admitted he was richer, or to exchange his wealth for A's, and then A would carry it out.

Exhalation (*anathumiasis*): (1) "The exhalations are two, one vaporous and one smoky" (*Mete*. 378^{a}18–19). (2) "The smoky exhalation . . . is common to air and earth" (*Sens*. 443^{a}27–28). The term is also used generically to refer to both dry and wet exhalations (*Mete*. 341^{b}6–10), and for the dry exhalation alone (342^{a}4).

Exist: See **Be**

Exôterikoi logoi: **External Accounts**

Experience (*empeiria*): *Empeiria* is not what we mean by experience: for us experience gives rise to memory; for Aristotle memory gives rise to *empeiria*. Suppose A perceives that when X_1 is sick with a fever giving him honey-water is followed by a reduction in fever (*Met.* 1027^{a}23–24) and that A retains this connection in his memory. Then he perceives that giving honey-water to X_2, X_3, . . . X_n is also followed by a reduction in fever. A also retains these connections in his memory. When as a result of retaining them A associates drinking honey-water with fever reduction, he has "a single experience," since "memories that are many in number constitute a single experience" (*APo*. 100^{a}5–6).

External Accounts (*exôterikoi logoi*): *Exôterikoi logoi* are mentioned at *Ph*. 217^{b}31, *Met*. 1076^{a}28, *NE* 1102^{a}26, 1140^{a}2, *EE* 1217^{b}24, 1218^{b}32, *Pol*. 1278^{b}31–32, 1323^{a}21, F38. *Cael*. 279^{a}30 mentions "the philosophical studies in circulation" and *DA* 407^{b}30 "the common accounts." The references seem to be to works written by Aristotle himself and "in circulation" (*NE* 1096^{a}3) outside the Lyceum, or to accounts or arguments, not necessarily by him, that are generally known. Whatever the precise reference it must be to things familiar to the relevant audience.

Faction (*stasis*): Internal political conflict, extending all the way from political tensions to outright civil war, typically occurring between rich (aristocrats, oligarchs) and poor (democrats), which can be severe enough to result in the overthrow or modification of the constitution.

Fallacy (*paralogismos*): Fallacies generally are sophistical refutations (*SE* 164^{a}20–21), which are based on acceptable beliefs or what appear to be such. Those which "proceed from things proper to a given science" (*Top*. 101^{a}6–7) are thus exceptions requiring special treatment. See *SE* 171^{b}11–22, 171^{b}34–172^{a}11.

False, Falsehood: See **Truth**

Fat (*pimelê*): Concocted blood (*PA* 651^{b}7–8). Discussed in *HA* 3.17–18, *PA* 2.5. See **Suet**

Fatherhood, Science of (*patrikê*): Discussed in *Pol*. 1.12. Called "procreative science" at 1253^{b}8–12.

Feeling (*pathos*): "Appetite, anger, fear, confidence, envy, enjoyment, love, hatred, longing, jealousy, pity, and, in general, whatever is accompanied by pleasure and pain" (*NE* 1105^{b}21–23). See **Affection**

Fellow Feelings for Human Beings (*philanthrôpia*): (1) A tragedy is *philanthrôpos* if it appeals to our fellow feelings for humans (*Po.* 1452^{b}38, 1456^{a}21). (2) In a more general sense, woodcocks are *philanthrôpos* in that they are easily domesticated (*HA* 617^{b}26), a person is *philanthrôpos* in that he is "humane" (*Ath*. 16.8), and an action that is done *philanthrôpôs* is done cordially (*Ath*. 18.3).

Female (*thêlu*): See **Male and Female**

Fetus (*embruon*): See **Embryo**

Fig Juice (*hopos*): The acidic juice of the fig tree, used like rennet to curdle milk in making cheese.

Figure, Configuration (*schêma*): (1) A geometrical figure (*APo*. 86^{a}1, *SE* 168^{b}1, *DA* 414^{b}20, *Met*. 1024^{b}1). (2) A figure in the way that we would speak of a "political figure" (*Met*. 1004^{b}18). (3) The shape (*PA* 640^{b}29, 641^{a}20) or form (640^{b}27, *Met*. 1029^{a}4) of something as opposed to its matter. (4) A figure of predication or category (1016^{b}34). (5) A syllogistic figure (*APr*. 26^{a}13, *APo*. 73^{a}14). (6) A style of speech (*SE* 166^{b}10). In *APr*. *homioschêmones* is "same in form" (27^{b}11, 34, 32^{b}37, 33^{a}37, 36^{a}7).

Finger (*daktulos*): The word *daktulos* also means "toe," and so is sometimes "digit," when a neutral term is needed (*PA* 690^{a}30).

Fire (*pur*): See **Element**

First Philosophy: See **Philosophy**

Fishing Frog (*batrachos*): Probably *Lophius piscatorius*. The popular names are "fishing frog," "angler fish," "sea devil," and "monkfish." They are teleostean fishes, not cartilaginous ones.

Fitting (*prosêkon*): What is fitting is what is appropriate, proper, or seemly—especially, perhaps in the sense of what it belongs to something to do because it is the sort of thing it is.

Flyer (*ptêtikos*): The adjective *ptêtikos*, like "flyer," applies either to what can fly or to what can fly well. Its negation, however, applies to what is (largely) incapable of flying (and so is a "non-flyer") (*HA* 558^{b}31).

Foolishness (*aphrosunê*): At *EE* 1234^{a}33–35, a connection is made between *aphrosunê* and *sôphrosunê* ("temperance"): "a sense of shame contributes to temperance (which is why people define temperance as being included in this kind); and the truthful and false are respectively wise and foolish (*aphrôn*)." Since we call temperance by this name "as being what preserves practical wisdom" (*NE* 1140^{b}11–12), and practical wisdom is the virtue of the rationally calculative (or deliberative) part of the soul (1139^{a}15–17, 1140^{a}25–28), *aphrosunê*, when not a result of nature, disease, or morbid madness, seems in particular to be the sort of foolishness that consists in a lack of practical wisdom.

Foot (*pous*): "A part [of the body], connected with a point on the ground, capable of causing movement with respect to place" (*IA* 706^{a}31–32).

Force (*bia*): (1) "'By force' and 'contrary to nature' are the same thing" (*Cael*. 300^{a}23). (2) "What is forced [is] contrary to impulse" (*Met*. 1072^{b}12; also 1015^{b}15). (3) In the case of actions "what is forced is what has a starting-point that comes from outside" (*NE* 1110^{a}1; also †*MM* 1188^{b}12–14).

Form (*eidos, idea*): (1) The *eidos* of something is often the class it belongs to (*huparchein*) or participates in (*metechein*), or the universal under which it falls (*hupo*) or that is predicated (*katêgorein*) of it. (2) When an *eidos* is contrasted with a *genos* it belongs to the *genos* and figures with it and a difference (*diaphora*) in the definition of the essence of the things the *eidos* belongs to. (3) When contrasted with matter, *eidos* is again related to essence: "By *eidos* I mean the essence of each thing and the primary substance" (*Met*. 1032^{b}1–2). (4) In senses (2) and (3) *eidos* is actuality or activity (*DA* 412^{a}10, 414^{a}18, *Met*. 1038^{b}6, 1042^{b}10), a this something (1017^{b}25–26, 1029^{a}28–29, 1042^{a}29, 1049^{a}35), and—in some cases—separable from matter (1037^{a}33–^{b}2, 1042^{a}31). (5) One sort of *eidos* is perceptible (*DA* 424^{a}18), another intelligible (429^{a}13–15); the former is sometimes "appearance" (*HA* 504^{a}13, 505^{b}13, 521^{a}33, *NE* 1167^{a}5), just as *idea* is sometimes "visible form" (*PA* 656^{a}3). (6) Occasionally *eidos* and *genos* are pretty much equivalent in meaning, like the corresponding English terms "form" and "kind."

Form, Platonic (*eidos*, *idea*): The origin and nature of the Platonic theory of Forms is discussed at *Met*. 1.6, 1078^{b}12–32, 1086^{a}31–^{b}13. The theory is criticized at *APo*. 77^{a}5–7, 83^{a}32–35, *Top*. 178^{b}36–179^{a}10, *Met*. 1.9, 7.6, 1033^{b}19–29, 7.13–15, 1045^{a}15–20, 13.4–5, 10, *NE* 1.6, *EE* 1.8. A target of criticism is often the separability of the Forms and the resulting confusion of universality and particularity (*Met*. 997^{b}8–12, 1040^{b}27–34) and susceptibility to the "third man" (1038^{b}34–1039^{a}3).

Form, Transmission of

According to Aristotle we find in nature an apparently continuous scale of beings, in which animate beings—beings with souls—differ only very slightly from inanimate ones in their level of formation (*HA* 588^{b}4–10). The sublunary elements aside, the simplest beings on this scale are uniform stuffs, such as wood, olive oil, flesh, and bone, whose parts have the same account as the whole (*GC* 314^{a}20, 328^{a}9–12). These are constituted out of the elements—earth, water, fire, air—in some ratio, when the active capacities (hot, cold) in the elements master the corresponding passive ones (dry, wet) (*Mete.* 378^{b}26–379^{a}1). The fundamental variety of this sort of mastery is concoction, which is "determined by the heat in its nature" (379^{b}34–35). Natural heat is thus formative heat—the thing in nature partly responsible for the coming to be and preservation of matter-form compounds.

Uniform stuffs, as minimally formed, have a low level of such heat. As formative heat is added, so that stuffs come to constitute the structural parts of animals (such as hands and eyes), and these to constitute whole animals of different degrees of complexity, natural heat increases: "the more complete ones are those that are hotter in nature and wetter and not earthen" (*GA* 732^{b}31–32). Such animals more completely pass on their form to offspring (733^{a}33–^{b}2). Since human beings are the most complete or most perfect animals (737^{b}26–27), they are also the hottest and most estimable (*Juv.* 477^{a}13–25). Although male and female human beings both have formative heat, its level is not the same in each. This is revealed by the different roles played by their respective spermatic products—seed (*sperma*) or semen (*gonê*) in the case of males, menses (*katamênia*), or rather the spermatic residue in them, in that of females—in reproduction: "the male provides both the form and the starting-point of movement, while the female provides the body, that is, the matter" (*GA* 729^{a}9–11).

What seed does to menses to form them into a fetus is likened to what a carpenter does to wood to make it into a piece of furniture (*GA* 730^{b}11–23), so that in the way that the movement of the carpenter's hands has its starting-point in the form or essence of the product present in his soul, the movement in the seed has its starting-point in a form—namely, that of the male progenitor. Hence the very same formal constituents exemplified as potentialities in his form are exemplified as movements in his seed, guaranteeing that these movements are (at least to begin with) formally identical to the potentialities that transmit them (*GA* 737^{a}20–22). Were this not so, their transmission to seed could not result in the transmission of the male's form to the offspring.

What enables the transmission of such movements to seed is, first, that they are present in the male's blood—where, encoded in formative heat, they are responsible for the preservation of his form—and, second, that seed itself is a very concentrated or concocted blood product (*GA* 726^{b}1–18). When the male's formal movements are transmitted by concoction to menses, therefore, they first initiate the formation of the fetal heart. Once the heart is formed, the fetus then grows automatically, drawing its nourishment from its mother through the umbilicus, and in the process transmitting formative movements via the blood to the other developing parts (735^{a}12–26).

Menses, however, also include a type of seed—"seed that is not pure but needs work" (*GA* 728^{a}26–27). For a female's formative heat is cooler than a male's, and so cannot complete the final stage of forming or concocting menses into pure seed (728^{a}18–21). In species without "separated" males, however, this may not be so (741^{a}32–38). Nonetheless, even in species where males and females are clearly distinguished, a female can concoct her menses (or the spermatic residue in it) to within that last stage of becoming pure seed, so that for each actual movement in male seed, there is a corresponding potential movement stemming from the female form in them (768^{a}11–14). While menses have the potential to move in such a way as to become a fetus, therefore, they cannot do so until they are set moving by male seed, since "in the things that come to be by nature or by craft, what is potentially such-and-such comes to be due to what is actually such-and-such" (734^{a}29–31). Equally well, of course, without menses to move, no new animal is generated either.

Just which movements will underlie the offspring's form—whether it will be, e.g., male or female—depends on the interaction between the movements in the male seed and the potential movements in the menses (*GA* 768^{b}5–12). If a male movement is transmitted successfully to the menses, the offspring will have the corresponding component of the male form. If it fails to be transmitted, it may be wholly resisted, in which case it is replaced by the opposing movement in the menses, or resisted to a lesser degree, with different consequences in each case (768^{a}7–9, 768^{b}7–8). The difference, then, between male *gonê* (always "semen") or *sperma* (always "seed") and the seed (or spermatic residue) in female menses is in one way quite small: they both encode more or less the same genetic information, as we would say. But in another way it is quite large: only male semen contains that information as actual movements, making it "the first thing containing a starting-point of generation" (724^{b}12–14) (leaving aside possible species in which female seed also contains it). The question is, How does the semen encode this information?

Semen, as we now know, is made up of individual sperms, each viable one of which is in principle capable of fertilizing a female ovum. Aristotle's view is quite different. For him the semen ejaculated is the fertilizing agent, not its sub-parts, and its viability, to call it that, depends on the level of formative or soul-producing heat in it relative to the quantity of female menses that it must work up (*GA* 767^{a}13–23). Nonetheless, if the menses is not to be uniformly concocted, but rather differentially so, in the way requisite for stepwise embryonic development, in which first the fetal heart is formed, then the parts around the head, and so on, the semen too, as Aristotle recognizes, must be "somehow divided into parts" (726^{b}5–6). Nothing is said explicitly about how this division actually takes place. But since semen is foamy, and foam contains bubbles, it is likely that the surrounding membranes of these are what mark the divisions, and encapsulate the formative heat in them (736^{a}13–18). It seems, then, that we should think of the male semen as somehow divided into bubbles, with different ones embodying the different movements needed to form the different parts of the embryo, and to endow them in turn with the formative heat needed for their growth and preservation. That is why we hear about "the proper heat present in each part" (784^{a}35, 786^{a}20).

While seed, as a concocted blood product, is a very purified type of nourishment, its natural heat, in which its formative movements are encoded, is of a quite special sort: "within the seed of everything there is present precisely that which makes the seeds be fertile, the so-called hot. This is not fire or that sort of capacity, but the breath enclosed within the seed and within the foamy part—that is, the nature in the breath, which is an analog of the element belonging to the stars" (*GA* 736^{b}33–737^{a}1). Characterized as "innate (*sumphuton*)," because it is not drawn in from outside but produced and maintained inside the body, it is the sort of breath that plays a fundamental role in nourishment and reproduction (741^{b}37–742^{a}16). It is distinguished from air and what we think of as breath most explicitly in the spurious *De Mundo*: "But something is said to be breath in another way when it is the ensouled and fertile substance in plants and animals and which pervades all things" (394^{b}9–11). The reproductive system, indeed, is in many ways simply a means of transmitting the form-preserving digestive system (of which blood and the heart are parts) into new matter, thereby initiating the formation of a new self-maintaining creature. That is why both functions are assigned to the *threptikon* or nutritive part of the soul (*DA* 416^{a}19, 416^{b}11–12).

Although many natural beings (e.g., ones we think of as inanimate) do not preserve their form by means of nourishment, or transmit it by means of sexual reproduction, breath has a fundamental role to play in their existence too: "Animals and plants come to be in earth and in liquid because in earth there is water present and in water breath, and in all breath there is soul-involving heat, so that in a certain way all things are full of soul" (*GA* 762^{a}18–21). For "just as some things have many uses in the crafts, as in blacksmithing are the hammer and the anvil, so too does breath in those composed by nature" (789^{b}9–12).

For-the-sake-of-Which, the (*to hou heneka*): (1) "The good or the for-the-sake-of-which" is one of the "primary starting-points and causes" (*Met*. 982^{b}9–10). (2) "The for-the-sake-of-which is an end, and the sort of end that is not for the sake of other things, but rather other things are for its sake" (994^{b}9–10). (3) "In the case of a house the source of the movement is the craft or the builder, the for-the-sake-of-which is the work, the matter is earth and stones, and the form is the account" (996^{b}6–8). (4) "The end—that is, the for-the-sake-of-which—is a last thing" (1021^{b}29–30). (5) "The for-the-sake-of-which is found in things that come about by nature or as a result of thought" (1065^{a}26–27). (6) "That the for-the-sake-of-which does exist among the immovable things is made clear by a distinction; for the for-the-sake-of-which is both for something and of something, and of these the one is moved and the other is not. And it produces movement insofar as it is loved, while it is by being moved that the other things move" (1072^{b}1–4). (7) "The what-it-is and the for-the-sake-of-which are one" (*Ph*. 198^{a}25–26). (8) "Nature is a cause, that is, one in the way that the for-the-sake-of-which is a cause" (199^{b}33). (9) "The for-the-sake-of-which lies in the account" (200^{a}14–15). (10) "The for-the-sake-of-which . . . is the cause of the matter, not the matter of the end. And the end is the for-the-sake-of-which and the starting-point springing from the definition and the account" (200^{a}33–35).

Free, Freedom (*eleutheros*, *eleutheria*): A free person is, in the first instance, someone who is not a slave. In this sense, the farmer citizens of a democracy are free people. But a farmer must work in order to get the necessities of life—he is not a person of leisure. So there is another sense in which he is not free. A person who is free in this second sense has distinctive character traits, education, and outlook. Unlike a slavish or unrefined person, he is not obsessed with practical or useful things (*Pol.* 1333^{b}9–10, 1338^{b}2–4), but is rather the sort of person "whose possessions are more noble and profitless than profitable and beneficial; for that is more characteristic of a self-sufficient person" (*NE* 1125^{a}11–12). The fact that he is well educated gives him a broad perspective on the world, rather than a narrow-minded or overly specialized one. Hence he is able to judge or assess the credibility and appropriateness of discussions belonging to different professions and disciplines in which he is not himself an expert, so as to be able to choose competent advisors when he needs them. Only this sort of free person can have practical wisdom and the virtues of character, so that he alone has what it takes to be an unconditional citizen in the best sort of city (*Pol.* 1329^{a}2–17). Since that city ensures that he has the resources needed for leisure (1329^{a}17–26), he does not need to work for a living, and so does not "live in dependence on others," which is another important mark of being free (*Rh.* 1367^{a}32). The art and music he enjoys, and the use he makes of his leisure, further distinguish him from those who are unrefined or uncivilized (*Pol.* 1334^{a}11–40, 1342^{a}19–32, *Po.* 1461^{b}26–1462^{a}4). But even such a citizen is often under the control of others, whom he must obey, so that there are often substantial limitations on his freedom or self-determination too.

Freeze (*pêgnunai*): See **Solidify**

Friend, Friendship (*philos*, *philia*): Generally speaking, *philia*, usually "friendship," should be understood to involve friendliness, since *philia* is a feeling (*EE* 1221^{a}7). This is especially clear in *Rh.* 2.4, which is devoted to friendliness and enmity. Translating the verb *philein* as "being friendly," however, misses the action focus of the verb, while "love," though it loses the common root of *philia* and *philein*, preserves it. Love has three proper objects: "good, pleasant, or useful" (*NE* 1155b19). As a result, friendship too is of three sorts: utility friendship, in which the friends are friends because they are useful to each other; pleasure friendship, in which the friends are friends because they give each other pleasure, because they enjoy each other; and virtue friendship, in which the friends are friends because of their virtue (*EE* 1236a13–15). And in each of these the degree of love should be proportional to the corresponding value: "people always think it fitting for the superior—whether in utility, in pleasure, or in accord with virtue—to love less or not at all" (1239a10–11). What makes utility friendship and pleasure friendship lesser sorts of friendship is that they do not involve loving the other person for his own sake, or because of himself and his intrinsic excellence, but because of something else—utility in the one case, pleasure in the other. As a result, these friendships are unstable, since when the other person ceases to be useful or a source of pleasure, the friendship ceases (1237b9–1238a10). The major discussions are *NE* 8–9, *EE* 7.

Gallbladder (*cholê*): Focally discussed in *PA* 4.2. *Cholê* refers both to what we call the "gallbladder" and to what we call "bile" (*HA* 487^{a}4). Context makes one a more natural translation than the other, but no distinction between the two should be assumed, in part because it is not clear (*PA* 677^{a}11–12) whether *cholê* is a residue (which would need to be in a vessel of some sort), a colliquescence (which would not), or a humor (677^{b}4).

Gampsônux: **Crook-taloned**

Generation (*genesis*): See **Coming to Be**

Generosity (*eleutheriotês*): The focal discussion is in *NE* 4.1, *EE* 3.4. Its contrary is ungenerosity (*aneleutheria*).

Gennaios: See **Breeding, Good**

Genos: **Kind**

Get More, One Who Tries to (*pleonektikos*): The verb *pleonektein* means to "get or have more," usually in the sense of more than one's fair share, although it is possible to get more in a just way: "they see others, some justly and some unjustly, getting more of these" (*Pol.* 1302^{b}1–2). The corresponding disposition, or character trait, is often greed (*pleonexia*), which, even if not always a vice, has a substantial potential to lead to vicious action.

Gignesthai: **Come to Be**

Gignôskein: **Know**

Ginnos: **Ginnus**

Ginnus (*ginnos*): A ginnus (plural: "ginni") is a "deformed mule" (*GA* 748^{b}34), the offspring of a mule and a mare (*HA* 577^{b}21); an *innos* seems to be the same thing.

Giving and Getting (*dosis kai lêpsis*): *Dosis* and *lêpsis* do not mean quite what we mean by giving and getting. For *lêpsis* does not mean getting wealth or money in exchange for something or by producing it, as a farmer or shoemaker might. That is why someone can "get" wealth or money from "his own possessions" (*NE* 1120^{b}1). Similarly, spending (*dapanê*) is included under *dosis* (1121^{a}12), because it is the absolute alienation of wealth, not the exchange of it for something of equal or comparable value. Someone who gives a bookseller $20 in return for a book has not "spent" anything, since his wealth remains unchanged by the transaction: he could return the book and get his $20 back. *Dosis* and *lêpsis* are not commercial activities, then, so much as they are social ones, like our gift giving and gift getting. That is why, when it is asked whether it belongs to "the generous person also to acquire and provide himself with money," the answer is "Surely not! For such things do not belong to any other virtue either. For it does not belong to courage to make weapons, but rather to something else, whereas it does belong to it, when it is has got these, to make correct use of them" (†*MM* 1192^{a}16–18). Acquiring and accumulating wealth is the work of the craft of wealth acquisition, which

is discussed in *Pol*. 1.3–4 and 1.8–11; 1.11 discusses the parts of it that a free person should know.

Glischros: **Viscous**

Gnômê: **Maxim, Consideration**

Gnomon: A device, like a carpenter's set square, used by the Pythagoreans in constructing the numbers. The one is both odd and even (*Met*. 986^{a}20). It is represented by ●, when odd, and by ●●, when even. Enclose ● with a gnomon (represented by lines). This gives Fig.1 below. Now enclose ●● with a gnomon. This gives Fig. 2.

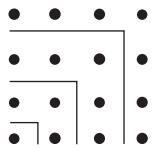

Fig. 1

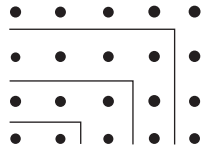

Fig. 2

In Fig. 1 a series of squares (square or even numbers) is generated; in Fig. 2 a series of rectangles (rectangular or odd numbers). The successive square or even numbers generated from ● (the one taken as odd) are all similar (= n^2). The successive rectangular or odd numbers generated from ●● are all dissimilar, since the ratio n:n + 1 is different for all values of n.

God (*theos*): Aristotle recognizes the existence of a number of different divine beings or gods, among whom he distinguishes a primary god, usually referred to as *ho theos* ("the god"), which is the one referred to as the immovable mover in *Ph*. 8.10 and more fully discussed together with the other divine beings in *Met*. 12.7–10. Exclusively a self-contemplating being (*Met*. 1074^{b}34–35), not one who engages in any world-making, he is nonetheless said to "make nothing pointlessly" (*Cael*. 271^{a}33). This raises a problem analogous to one that we meet in *NE* 10, where we are told that "the gods exercise a sort of supervision over human affairs" (1179^{a}24–25). For the gods in question also live exclusively contemplative lives (1178^{b}21), so that whatever supervision they exercise must be of a somewhat special sort. Aristotle does not tell us what it is, but his identification of these gods with the heavenly spheres (*Met*. 1074^{a}38–^{b}14) suggests an answer. For the orderly revolutions of these spheres govern the seasons as well as the cycles of fertility and infertility of land and animals (*GA* 778^{a}4–9). Hence they confer benefits on all beings, but especially on those wise people who, through study of the heavens, learn about these cycles and adjust their lives accordingly. Something similar is presumably true of the primary god, since he is, as the immovable mover of the heavenly spheres, responsible for that order (*Met*. 12.10).

Gonê: See **Seed**

Gonos: **Seed, a**

Good (*agathos*)
A good is "whatever is choiceworthy for its own sake; or that for whose sake we choose something else; or what all things aim at, or all that have perception or understanding, or would aim at if they got understanding" (*Rh*. 1362^{a}21–24). A *good X* is one that possesses the virtues or excellences that enable it to complete the work characteristic and definitive of X's (1097^{b}24–1098^{a}20). *The* good is what is choiceworthy for its own sake only and not for the sake of something else. The good for human beings—the human good—is happiness, while other things aimed at are good to the degree that they promote happiness (*NE* 1152^{b}1–2).

Aristotle divides goods of the latter sort into three sorts: external goods (also called resources or goods of luck), goods of the soul, and goods of the body (*NE* 1098^{b}12–16, *Pol*. 1323^{a}25–26). External goods are usually those that are external to the soul (*Pol*. 1323^{b}7–8), although sometimes goods relating to the body are also classed as internal goods (*Rh*. 1360^{b}26–27). Goods of the soul are states (the virtues) and the activities that are in accord with them, such as doing well in action (*eupraxia*) or happiness. External goods and goods of the body, on the other hand, are capacities or tools that the virtuous person uses to achieve good ends, and the vicious bad ones (*Pol*. 1323^{b}7–12).

Although external goods, unlike goods of the soul, are the result of luck (*Pol*. 1323^{b}27–29), the sphere of luck can be reduced by craft and science, so that many external goods admit of at least limited human control (*NE* 1140^{a}17–20, *Met*. 981^{a}1–5). Some external goods—such as money, honors, and bodily pleasure—are fought over or competed for, while others—such as friends, beauty, or good breeding—are not (*NE* 1169^{a}20–21). The former are the area of focus for many of the virtues of character.

"Good is said of things in as many ways as being" (*NE* 1096^{a}23–24), so that there is no single science of the good. When contrasted with the bad, "the good is simple, while the bad is multiform" (*EE* 1239^{b}12; also *NE* 1106^{b}35).

Good Legislative Order (*eunomia*): *Eunomia* is connected with political virtue (*Pol*. 1280^{b}6), and identified with good order (*eutaxia*) (1326^{a}30–31).

Gourmet Dish (*opson*): In Aristotle's works an *opson* is usually an expensive or elaborate dinner dish cooked in an expert way, but it can also be a relish or small quantity of savory food, such as cheese or olives, served as an accompaniment to bread or another staple.

Governing Body (*politeuma*): **Constitution**

Graphê: **Writ**

Growth and Withering (*auxêsis kai phthisis*): Focally discussed in *GC* 1.5. More generally, "increase and decrease."

Grub (*schadôn*): In bees and wasps (*HA* 555^{a}8) a grub is a larva at a later stage of development, with wings, feet, and a head (554^{a}29, ^{b}3).

Guest-Friend (*xenos*): Guest-friendship (*xenikê philia*) was a ritualized form of pseudo-kinship (typically) between men of equal social status but belonging to different social units (such as Athens and Sparta), involving a variety of forms of mutual support, including exchange of valuable resources (gifts, troops) and services (a home away from home, paying a ransom). The relationship, like true kinship, was perpetual, descending from fathers to sons, so that, e.g., a *xenos* was expected to show protective concern for the son of his *xenos*, including acting as his substitute father if his real father died.

Gullet (*stomachos*): Another name for the esophagus (*HA* 495^{a}18–20).

Gumnastikê: **Physical Training**

Habit (*ethos*): (1) "Things that occur by habit are whatever things people do due to having done them often" (*Rh.* 1369^{b}6–7). (2) "The virtues . . . are brought to completion through habit" (*NE* 1103^{a}24–26). (3) "Legislators make citizens good by habituating them" (1103^{b}3–4).

Habituation (*ethismos*): A process, typically involving pleasure (reward) and pain (punishment), by which we acquire a habit that is at once cognitive (as in the case of induction) and conative, because what we experience as pleasurable we tend to desire and pursue, and what we experience as painful we tend to be averse to and avoid (*DA* 431^{a}8–^{b}12, *NE* 1114^{a}31–^{b}3, 1119^{a}25–27, *Pol.* 1340^{a}23–28).

Haima: **Blood**

Happiness (*eudaimonia*)

The "work of a human being is activity of the soul in accord with reason or not without reason" (*NE* 1098^{a}13–14); human virtue is what enables that work to be completed well (1098^{a}15). As a result, the human good, which is happiness (1097^{b}22), "turns out to be activity of the soul in accord with virtue" (1098^{a}15–16) or "doing well in action (*eupraxia*) involving virtue" (*Rh.* 1360^{b}14). But if there are more virtues than one, the action or activity must be "in accord with the best and most complete" (*NE* 1098^{a}17–18). Moreover, since a few such actions or activities are not enough to make a whole life happy, the life itself must be complete, or "lacking in nothing" (1097^{b}15). It thus requires a good supply of the external goods necessary for a life of virtuous action (1101^{a}14–21).

Our understanding is the divine element in us, and the one with which we are most to be identified (*NE* 1178^{a}2–8). Its work (contemplation) is, therefore, the human work par excellence (F90 42.5–43.25), and its activity is the best sort of happiness when brought to completion in accord with theoretical wisdom, which is the best and most complete virtue (*NE* 1177^{b}16–26).

But a human being is a political animal. He needs family, friends, fellow citizens, and other external goods if he is to be able to contemplate, and cannot survive on a

diet of contemplation alone, since his nature, unlike a god's, is not self-sufficient for it (*NE* 1178^{b}33–1179^{a}9). Insofar as he is human, therefore, he will deliberately choose to do actions that are in accord with practical wisdom and the virtues of character. And the life consisting in such actions, even if no better sort of happiness is thereby furthered, is "happiest, but in a secondary way . . . for the activities in accord with it are [merely] human" (1178^{a}9–10).

Practical wisdom and the virtues of character would not be what they are, however, if they did not aim to further the best sort of happiness (*NE* 1145^{a}6–11). The life consisting of unleisured practical political activity in accord with practical wisdom and the virtues of character is the altogether happiest one, when—because it is led in a city with the best constitution, well situated and provisioned with external goods—it succeeds in achieving the best sort of happiness for its possessor. This complex life—part practical, part contemplative—is the best human life that practical wisdom, which is the best sort of practical knowledge, can arrange.

Hard, Soft (*sklêron*, *malakon*): "Hard is that whose surface cannot be pressed into itself; soft is that whose surface can be pressed in, but not by being replaced; for water is not soft; for its surface is not pressed downward by pressure, but is replaced. Something is unconditionally hard or unconditionally soft if it is unconditionally like that, while it is so in relation to something else if it is like that in relation to it" (*Mete*. 382^{a}11–16).

Hard-shelled (*ostrakodermos*): Hard-shelled animals "have their fleshy part inside and their solid part—which is shatterable and breakable, but not receptive of impressions—outside" (*HA* 523^{b}9–11). Literally, "potshard-skins."

Hard-scaled (*pholidôtos*): E.g., the crocodile.

Hard-skinned: (*sklêrodermos*): E.g., the crayfishes.

Harmonies (*harmoniai*): d = ditone (the interval of a major third); q = quarter-tone; s = semitone; t = tone:

Mixolydian:	q, q, d, q, q, d, t
Dorian:	q, q, d, t, q, q, d
Phrygian:	d, q, q, d, t, q, q

These can be represented as two tetrachords, each of the form q, q, d, together with a tone that disjoins them.

Harsh: *austêros*

Having (*echein*): The category of "having on" (*Cat*. 2^{a}3), but also the cross-categorial modes of having discussed in *Cat*. 15.

Hearth, Communal (*hestia*): A city's communal hearth derived from the hearth in a king's palace, which was of both practical and magical or religious significance.

Heat, Hot (*thermotês, thermos*): The hot, for Aristotle, is "what aggregates things of the same kind" (*GC* 329^{b}26–27). Felt heat, by contrast, which is what we usually mean by "heat," is an affective perceptual quality (*Cat*. 9^{b}2–9). See **Form, Transmission of**

Heaven (*ouranos*): "In one way, then, we say that the substance belonging to the outermost revolution of the universe is heaven, or the natural body that is on the outermost circumference of the universe; for more than anything else it is the last upper region that we usually call 'heaven,' the one in which we say that everything divine also has its seat. In another way, it is the body that is continuous with the outermost circumference of the universe, in which we find the moon, the sun, and some of the stars; for we say that these bodies too are in the heaven. Further, we say that the body that is encompassed by the outermost circumference is heaven; for we are accustomed to say that the whole and the universe is heaven. Something is said to be heaven is, then, in three ways. The whole encompassed by the outermost circumference is of necessity composed of the totality of natural and perceptible body, because there neither is nor can be any body outside the heaven" (*Cael*. 278^{b}11–21). This whole and its parts are classed as substances at 298^{a}30–31.

Heavy, Light (*barus, kouphos*): See **Weight**

Hê(i): **Insofar as, Qua**

Hekôn: **Voluntary**

Hêmeros: When it is the contrary of *agrios* ("wild"), *hêmeros* is "tame," even when "domestic" might be more natural. It can also mean "gentle," "peaceful," and the like.

Hen: **One**

Hepsêsis: **Boiling**

Herd, Live in a (*agelaios*): The distinction between animals that live in herds and those that live scattered about (*sporadikos*) or are solitary (*monadikos*) is an important one (*Pol*. 1256^{a}23), as is that between herd animals and political ones (*HA* 488^{a}7–9, *Pol*. 1253^{a}7–9). So "herd" is used to mark the distinction, even where we would more naturally use "flock," "shoal," or some other term, as in the case of insects (*HA* 623^{b}8) or dolphins (631^{a}16). Shoal fishes (*chutoi*) (*HA* 543^{a}2) are "the ones caught in nets," whereas the "fish that go in shoals with the currents (*rhuades*)"—like the ones that live in herds, and perhaps not always distinguished from them (598^{a}28)—do seem to form some sort of natural class (543^{b}13–14, 570^{b}11). A "gathering (*athroisis*)" of animals need not be a herd, but a flock (*poimê*) of sheep (573^{b}25) is one.

Hetaireia: **Political Club**

Hexis: **State**

Hiding, Going into (*phôlein*): Aristotle uses the verbs *phôlein* and *phôleuein* for hibernation proper and for aestivation (*HA* 598^{b}4–20), but also for something more general and more akin to just staying out of sight (632^{b}27).

Historia: Not a history, in our sense of the term, but an inquiry, and, in Aristotle, more precisely, a preliminary stage in the development of a science, when data is collected and systematically categorized, but not typically given a causal explanation. One reason that *HA* 10 is thought not to properly belong with the other books of *HA*, indeed, is that it does contain such explanations.

Hoi polloi: **Ordinary People, the Many**

Homoiomerês: **Uniform**

Homonymy (*homônumia*): "Things are said to be homonymous when they have only the name in common but the account that corresponds to the name is distinct" (*Cat*. 1^{a}1–2).

Honor (*timê*): (1) "Honor is like a sort of estimate of worth" (*Rh*. 1365^{a}7–8). (2) Honor is "the greatest of external goods" (*NE* 1123^{b}20–21). (3) "Honor is a prize of virtue and is awarded to good people" (1123^{b}35–1124^{a}1; also 1163^{b}3–4). (4) "Those things are noble for which the rewards are honor" (*Rh*. 1366^{b}34–35). (5) "Those who desire honor from decent and knowledgeable people . . . are aiming to confirm their own beliefs about themselves" (*NE* 1159^{a}22–23; also 1095^{b}26–28). See **Noble, for the Sake of the**

Hoper: **Precisely**

Hoplite (*hoplitês*): A heavily armed infantryman, who carried a round shield (*hoplon*), a spear, and a sword. Since he had to provide these at his own expense, only moderately rich people could afford to be hoplites. Poorer people rowed in the navy or served as light-armored troops. Richer citizens, who could afford a horse, fought in the cavalry. Citizen hoplites were the principal fighting force in Greece until mercenaries replaced them late in the 4th cent BC. The hoplites are a larger class than the rich "few" who rule in an oligarchy but smaller—since hoplite weapons are expensive—than the poor "many" who rule in a democracy. That is why a polity, which is so called because it is "made up of those with hoplite weapons" (*Pol*. 1265^{b}28–29), is in the mean or middle between the two of them.

Hopos: **Fig Juice**

Hôra: **Bloom**

Horasis: **Seeing**

Horismos: **Definition**

Hormê: **Impulse**

Horos: **Defining Mark, Definition**

Hôs epi to polu: **Most Part, for the**

Hou heneka: **For-the-sake-of-which**

Household Management (*oikonomikê*): Household management (also *oikonomia*) when possessed by a male is (1) the craft or science that deals with the use of wealth or property (*Pol.* 1256^{a}10–13) and to some extent with its acquisition too (1256^{b}26–30); when possessed by a female it is (2) the craft of preserving it (1277^{b}24–25). The natural part of the craft of property acquisition is a part of (1) (1256^{b}26–27), but the craft of commerce is not. Other parts of (1) are mastership of slaves, marital science, and procreative science (see 1.3, 1.12–13).

Hubris: **Wanton Aggression**

Hudôr: **Water**

Hugros: See **Dry**

Hulê: **Matter**

Human Being (*anthrôpos*): (1) An *anthrôpos* is a human being of either sex. The adjective *anthrôpinos* often seems to mean something like "merely human" (*NE* 1177^{b}32). *Anthrôpikos* sometimes has similar connotations (1178^{a}10). Indeed, *anthrôpos* itself is sometimes used to refer to the whole human animal, sometimes to the human element in human beings by contrast with the divine one (their understanding) (1177^{b}27–28), and sometimes to that divine element, since it is what makes human beings distinctively human (1176^{a}25–29). In considering what the work of a human being is (1097^{b}24–25), and what its most complete virtue is (1098^{a}17–18), it is important to bear these facts in mind. (2) A human being is by nature a political animal (*NE* 1169^{b}18–19), where political animals are "those among which there is some single work common to all" (*HA* 488^{a}7–8). In this sense, animals such as bees, wasps, ants, and cranes also count as political animals. But human beings are political animals to a higher degree than any herd animal. For they alone "have perception of the good and the bad, the just and the unjust, and the rest. And it is community in these that makes a household and a city" (*Pol.* 1253^{a}16–18). So human beings are political animals more than others, because they are by nature city (*polis*) dwellers (*NE* 1162^{a}17–19, *Pol.* 1278^{b}15–30).

Humor, Juice (*chumos*): (1) the "juice" or sap in plants (*HA* 554^{a}13, 596^{b}17); (2) animal juices (556^{b}22); (3) the special object of taste (*DA* 418^{a}13), which is a sort of touch (414^{b}11); (4) a sort of seasoning that adds flavor (414^{b}13).

Huparchein: **Belong to, Hold**

Huperochê: **Excess**

Hupokeimenon: **Underlying Subject**

Hupolêpsis: **Supposition**

Hupozôma: **Diaphragm**

Hypothesis (*hupothesis*): (1) "A posit that assumes either part of a contradiction" (*APo*. 72^{a}18–20). (2) "Hypotheses are the starting-points of demonstrations" (*Met*. 1013^{a}16). (3) The hypothesis of a political constitution is its basic presupposition about how happiness is to be achieved and what it consists in, and so is identified with the deliberately chosen aim of the constitution (*Pol*. 1261^{a}16, 1271^{a}41, 1273^{a}4).

Idea: See **Form, Platonic**

Idion: **Private, Special**

Image: *Eidôlon*

Imagination (*phantasia*): Discussed at *DA* 3.3. The important distinction between perceptual imagination and deliberative imagination is drawn at *DA* 434^{a}6–12.

Imaginative Part (*phantastikon*): "The same as the perceptual part, though the being for imagination and the being for perception are distinct" (*Insomn*. 459^{a}15–17). Also mentioned at *DA* 432^{b}1.

Imitate, Imitation (*mimeisthai*, *mimêsis*): "A likeness (*eikôn*) is something whose coming to be is through a *mimêsis*" (*Top*. 140^{a}14–15), so that to imitate (*mimeisthai*) something is (roughly speaking) to be like it in some respect, act like it in some way, or produce something that is like it in some way. Hence *mimêsis* is a quite general notion, the use of which in *Po*. 1–3, 6, and its cognate use in *Pol*. 8 (1336^{b}16, 1340^{a}12, ^{a}39) and elsewhere (*Rh*. 1371^{b}6, †*MM* 1190^{a}31), is continuous with its use in other treatises. Translating it as "mimesis" there, as if it were a technical term special to poetics, disguises this fact, while translating it as "representation" prevents the continuity from being properly reflected across all the treatises. The following examples are illustrative: "craft imitates nature" (*Ph*. 194^{a}21–22; also *Mete*. 381^{b}6); the palm of the ape imitates the human heel (*HA* 502^{b}9–10); the *anthos* imitates the horse's voice (609^{b}16–17); the lives of the other animals contain "many imitations of the life of human beings" (612^{b}18–19); the beings that imitate the numbers (*Met*. 987^{b}11–12); "the plane and the solid are imitations" of "the numbers being of a certain quality" (1020^{b}3–5); "things that cannot pass away are imitated by things that are involved in change" (1050^{b}28–29); a rash person imitates a courageous person (*NE* 1115^{b}32), while others imitate the great-souled person (1124^{b}2); one should imitate the better person in everything (1171^{b}12); "names are imitations, and the voice, the most imitative of all our parts" (*Rh*. 1404^{a}21–22).

Immediate (*amesos*): To be immediate is to lack a middle term: so C belongs to A indivisibly (*APo*. 79^{a}33) or immediately if and only if there is no distinct term B such that if B belongs to A and C belongs to B, then it follows deductively that C belongs to A. Immediates are also referred to in *APo*. as *atoma* ("indivisibles").

Immortality (*athanasia*):(1) "Immortality is eternal life; for immortality seems to be an affection or coincident of life" (*Top*. 126^{b}35–37). (2) "The activity of a god is immortality, and this is eternal living" (*Cael*. 286^{a}9).

Immortalize (*athanatizein*): The precise meaning of the injunction "one must as far as possible immortalize" (*NE* 1177^{b}33)" is difficult to determine. The one other occurrence of its verb in a text of Aristotle's (although it may be spurious) is in F223: "Aristotle himself, in his *Defense against the Charge of Impiety*, if the speech is not spurious, says, 'For I would never have proposed to sacrifice to Hermias as an immortal, but prepared a memorial to him as a mortal and, wishing to immortalize his nature adorned it with funerary honors.'" Since there is no inconsistency and slim basis for a charge of impiety in preparing a memorial for someone and adorning his body with burial honors, on the one hand, and simply regarding him as being *like* an immortal, on the other, *athanatizein* must mean something like "make an immortal of." Aristotle's injunction, then, would be that one must make an immortal of oneself by living in accord with one's immortal element (*nous*), which is what one most of all is; something one would accomplish by contemplating—by engaging in god's science, which is theoretical wisdom (*Met*. 982^{b}22–983^{a}11). Compare Plato, *Timaeus* 90b–c.

Imprint: See **Outline**

Impulse (*hormê*): The claim that "a human being is by nature a political animal" (*Pol*. 1253^{a}2–3) means, in part, that "by nature, the impulse toward this sort of community exists in everyone" (1253^{a}29–30)—nature and impulse are again associated at *Met.* 1023^{a}9, and opposed to what is forced (1072^{b}12).

Impulsive (*melagcholikos*): A *melagcholikos* person is not melancholic in our sense of the term but someone who has intense desires (*NE* 1154^{b}11–13) and is easily affected by imagination and dreams (*Mem*. 453^{a}19, *Div. Somn*. 463^{b}17).

In (*en*), **Said of** (*legetai*): The distinction is introduced in *Cat*. 1^{a}20–21, where the former is explained as follows: "I call 'in a subject' what is in something, not as a part, and cannot exist separately from what it is in" (*Cat*. 1^{a}24–25). Though no comparably direct account is given of "said of a subject," at 2^{a}19 we learn two necessary, and perhaps jointly sufficient, conditions for it: if B is said of a subject, A, then both the name of B and the definition of B will be predicated of A. The "said of" relation is ontological, not linguistic: it is (the form) human that is said of Socrates, because both its name ("human") and its definition ("rational animal") are predicated of Socrates.

Increase and Decrease (*auxêsis kai phthisis*): In biological contexts, "growth and withering."

Indictment (*eisaggelia*): Unlike a writ, an indictment had to be brought before the assembly of Athenian male citizens or before its steering committee, the council, either of which could elect to hear the case or refer it to the courts for trial (*Ath*. 43.2, 45.2). See **Denunciation; Writ**.

Indignation (*nemesis*): The most extended discussion is in *Rh*. 2.9, where indignation is classified as a feeling. At *NE* 1108^{a}35–^{b}6, however, it is a virtuous state and, at *EE* 1233^{b}24–27, it includes pain at undeserved misfortunes, something *Rh.* ascribes to pity.

Indivisible (*atomon*): What is *atomon* ("uncuttable") is in some way indivisible, so that points are indivisible (*Met*. 1016^{b}26), but bodies (including so-called atoms) are not (*GC* 316^{a}14–^{b}5). An *atomon* F is one not divisible into further Fs, so that an *atomon* form (*Ph*. 227^{b}7) is one not further divisible into forms, and an *atomon* human being is an indivisible, individual, or particular human being (*Cat*. 1^{b}4–6, 3^{a}38); what is *atomon* in this way is one in number (3^{b}12–13). When F is a quality, or some other item that is not a substance, *to ti* F, such as *to ti leukon* (1^{a}27–28), it may be an ultimate shade of white, with no further sub-shades, or—as is perhaps more likely—a particular instance of some shade of white, whose presence in a particular substance, A, makes it true that it coincides with A and that A is predicatively white (*Met*. 1077^{b}5–9).

Indivisible Lines (*atomoi grammai*): Plato held that a point "consisted of indivisible lines" (*Met*. 992^{a}22). *GC* 316^{a}11–12 mentions those who argue in a logico-linguistic way that there must be indivisible magnitudes "because the triangle-itself will [otherwise] be many." The spurious *On Incommensurable Lines* gives the argument: "If there is a Form of line, and if the first of the things is called by the same name, then, since the parts are prior to the whole, line-itself must be indivisible" (968^{a}9–11). But indivisible lines conflict with a starting-point of mathematics, namely, that quantities are divisible without limit. In this regard positing them is quite different from raising puzzles or fallacies proper to mathematics, because these are based on its starting-points. Hippocrates' argument for squaring the circle by means of lunes is thus a geometrical fallacy, since "it is directed against geometry only, because it is based on starting-points that are special to it" (*SE* 172^{a}4–5). However, someone who gives Antiphon's argument for squaring the circle, which assumes that a circle is a polygon with a large but finite number of sides, has produced a sophistical refutation, since his argument is not proper to geometry but "*koinos* (common)" (172^{a}8–9). Dealing with him, as a result, is a job for dialecticians: "to get [a theoretical grasp] on a refutation based on what is common, and that falls under no [specialized] craft, belongs to dialecticians" (170^{a}38–39).

Induction (*epagôgê*): "Induction is the route from the particulars to the universal" (*Top*. 105^{a}13–14), which begins with perception of particulars and ends with the grasp of a universal by understanding (*APo*. 99^{b}35–100^{b}5).

Indulgence (*apolausis*): (1) "Ordinary people . . . suppose [happiness] to be pleasure. And that is why the life they like is the life of indulgence" (*NE* 1095^{b}16–17), specifically in "bodily pleasures" (*EE* 1215^{b}5; also *Pol* 1270^{b}35). (2) "The things that are fruitful are more useful, while the things that are related to indulgence are more free" (*Rh*. 1361^{a}16–17).

Insects (*entoma*): "All the animals that . . . have either their underneath parts, back parts, or both in sections, and do not have either a separate bony part or fleshy part, but something intermediate between the two; for their body is similarly hard both on the inside and outside" (*HA* 523^{b}13–17).

Insofar as (*hê(i)*): (1) The dative of the relative pronoun, (Latin) *qua*—as "in being qua being." The science of the latter is that of being regarded in a certain way, namely, insofar as it is being, not the science of a special sort of being: being-qua-being. (2) "By 'insofar as,' I mean this: The bronze is indeed potentially a statue, but nonetheless it is not the actualization of the bronze insofar as it is bronze that is movement. For being for bronze is not the same as being for a certain potential, since if it were unconditionally the same in account, the actualization of the bronze would be a sort of movement" (*Met*. 1065^{b}23–27). (3) When X is G insofar as it is F, F is often the intrinsic cause or basis of X's being G.

Inspection (*euthuna*): A procedure designed to ensure (typically) democratic control of officials (*Pol*. 1274^{a}17, 1281^{b}33, 1282^{a}26, 1322^{b}11). Officials were subject to inspection to see whether they had taken bribes, embezzled public funds, or been guilty of maladministration (*Ath*. 54.2).

Instrument (*organon*): An *organon* is often what we would naturally call an "organ," such as the heart, but just as often it refers to some part of an animal, such as a foot, that we would not call one, or to a craftsman's tools, making "instrument" preferable as a consistent translation.

Intelligible Object (*noêma*): An intelligible object or content is a universal form. Encoded in an appearance, it can be grasped by the understanding when it contemplates that appearance: "To the thinking soul . . . appearances are like perceptual affections. . . . What is capable of understanding, then, understands the forms in the appearances" (*DA* 431^{a}14–^{b}3). It differs from an appearance in being a propositional element—an element of something with a truth value: "when one contemplates, one must at the same time contemplate an appearance. . . . But imagination is distinct from affirmation and denial; for truth and falsity involve a combination of intelligible objects" (432^{a}8–12).

Interval: See **Dimension**

Intrinsic (*kath' hauto*): Something is intrinsically F—or F by itself, in its own right, or (Latin) *per se* F—if it is F unconditionally, or because of what it itself essentially is: "'intrinsically' and 'insofar as it is itself' are the same" (*APo*. 73^{b}29). Socrates is intrinsically rational, since being rational is part of being human and Socrates is essentially human, but he is not intrinsically musical, since being musical is not part of what it is to be human. See **Coincident**

Isos: **Equal**

Isôs: See **Perhaps**

Jibes (*skôptein*): Wit, or jibing well, is "well-educated wanton aggression" (*Rh*. 1389^{b}11–12). It is discussed at *NE* 4.8.

Judge (*dikastês*): Athenian trials had large juries which reached their decision without deliberation or judicial guidance, so that these served as both judge and jury. Being eligible to serve in the ruling office of judge was an important prerogative of the unconditional citizen (*Pol*. 1275^{a}22–23).

Juice: See **Humor**

Justice (*dikaiosunê*): The fullest discussion is in *NE* 5; *Pol*. 3.9, 3.12 are also important.

Kairos: **Opportune Moment**

Keynote (*endosimon*): Both a prelude or an introduction and what establishes the pitch for musicians at the beginning of a performance. See *Pol.* 1339^{a}13, *Rh.* 1414^{b}24, 1415^{a}7.

Kind (*genos*): (1) Aristotle's uses of *genos*, *eidos*, and *diaphora*—of which "genus," "species," and "differentia" are the traditional (but inaccurate) Latinate translations—are many and various. In the strict sense "a kind is what is predicated in the what-it-is of many things that differ in form" (*Top.* 102^{a}31–32), and is studied by a single science. But as the entry in *Met.* 5.28 shows, it can also be quite a few other things besides this, e.g., a race or bloodline. A category too is quite often referred to as a kind (*Ph.* 189^{a}14, *Met.* 1070^{b}20, 1089^{b}28). By the same token, a *diaphora* is sometimes a difference that divides a kind into forms, and so figures in their essential definitions: "forms are composed of the kind and the differences" (*Met.* 1057^{b}7). But often *diaphorai* are simply the different features that distinguish one sort of thing from another, without necessarily suggesting that the sorts in question are kinds or forms. Among kinds in the strict sense, Aristotle occasionally lists some he calls "chief kinds" (*HA* 490^{b}7, 16, 505^{b}26). (2) Difference is distinguished from distinctness (*heterotês*) at *Met.* 1054^{b}23–30.

Kind, Fourth (*tetarton genos*): (1) "This fourth kind [of animal] must be sought on the moon; for the moon appears to participate in [the elemental body] at the fourth remove" (*GA* 761^{b}21–22). (2) "In Cyprus, in places where copper ore is smelted, and thrown there for many days, beasts come to be in the fire" (*HA* 552^{b}10–12). (3) "If, then, ice is the solidification of wet and cold, fire will be the boiling of dry and hot. That is why nothing comes to be either from ice or from fire" (*GC* 330^{b}28–30). (4) "Fire does not generate any animal, nor, it is evident, anything composed in things affected by fire, whether wet ones or dry ones" (*GA* 737^{a}1–3). (5) "It is only in earth and in water that there are animals, and not in air or fire, because the former ones are the matter of their bodies" (*Mete.* 382^{a}6–8). A way to partly resolve the tensions between these five claims is to recall that all of them, as belonging to natural science, rather than to a strictly theoretical one, hold only for the most part. But it is also important to remember that so-called (or non-elemental) fire's "underlying subject is smoke or charcoal" (*PA* 649^{a}21), that smoke is an exhalation that is dry and earthen (*Mete.* 341^{b}6–10). We are in an area, in other words, where "the more and the less and nearer and further" may indeed "produce a great and wondrous difference" (*GA* 761^{b}14–15).

Kinêsis: **Movement**

King (*basileus*): A kingship is a monarchical constitution that aims at the common advantage (*Pol*. 1279^{a}32–34). Its deviant form is tyranny. Five sorts of kingship are discussed in *Pol*. 3.14: Spartan kingship; barbarian kingship; dictatorship; consensual, elective, law-based kingship; and absolute kingship. In 3.15 (1285^{b}33–37) these are reduced to two fundamental sorts: Spartan and absolute. In 3.16 Spartan kingship is removed from the list of genuine sorts of kingship, on the grounds that it is not a sort of constitution (1287^{a}3–4).

Know, Knowledge: Although there may be little difference between *gnôsis* (verb: *gnorizein*) and *epistêmê* (verb: *epistasthai*), *epistêmê* is usually applied only to demonstrative sciences, crafts, or other bodies of systematic knowledge, so that *epistêmê* is specifically scientific knowledge. *Gnôsis* is usually weaker and is used for perceptual knowledge and knowledge by acquaintance—something familiar is *gnôrimon*. If X knows that p, it follows that p is true and that X is justified in believing it. Similar entailments hold in the cases of *epistasthai* and *eidenai* but may not hold in that of *gignôskein*.

Kochlias: **Land Snail**

Kochlos: **Sea Snail**

Koilia: **Stomach**

Koina: **Common Things**

Koinônia: **Community**

Knucklebone (*astragalos*): An ancient sort of die made from the knucklebone of a sheep used in a game of chance. See *HA* 499^{b}28–30.

Kolobos: **Docked**

Kottabos: A game involving flicking wine lees at targets.

Krasis: See **Blend; Mixture**

Krinein, krisis: **Discern, Judge**

Kuêma: **Embryo**

Kuêsis: **Pregnancy**

Kurios: (1) In a key sense what is *kurios* is what has executive power or authority or the power to compel, so that a general has control over his army and a politician over a city and its inhabitants. Since what has control in a sphere determines or partly determines what happens within it, it is one of the most estimable or important elements in the sphere, so that what is less estimable than something cannot or should not control it (*NE* 1143^{b}33–35, 1145^{a}6–7). (2) *Ta kuria* are the words that are in prevalent use among listeners (*Po*. 1457^{b}3–5). (3) When contrasted with the metaphorical sense of a term, the *kurios* sense is the "literal" one (*Top*. 140^{a}13). (4) The *kurios* definition

of something, like the *kurios* use of a term, is its strict one (*Cat*. 2[a]11, *Met*. 1020[a]4, [b]14), which thus exerts control over the extended uses of it (*DA* 408[a]6). (5) Similarly, the *kuriôtatos* differences of bodies are the principal or "most fundamental" ones (*Cael*. 307[b]19). (6) *Kuriôs* and *haplôs* ("unconditionally") are often used interchangeably (*Cat*. 14[b]24), as are *kuriôs* and *kath' hauta* ("intrinsically") (5[b]8).

Laborer, Hired (*thês*): A free, landless laborer, who was not a craftsman and who worked for hire. His status in Aristotle's scheme of things, like that of an unrefined craftsman, is somewhat anomalous.

Land Snail: *Kochlias*

Larva (*skôlêx*): "That from the whole of which the whole of the animal comes to be, as the embryo becomes articulated and grows" (*HA* 489[b]7–9).

Last Thing (*eschaton*): See **End**

Law (*nomos*)
(1) "The law . . . [is] word that derives from a sort of practical wisdom and understanding" (*NE* 1180[a]21–22). (2) "Law is understanding without desire" (*Pol*. 1287[a]32).

Varieties: (1) "Law is either special or common. By 'special' I mean the written law by which people are governed; by 'common' I mean whatever unwritten ones seem to be agreed to among all" (*Rh*. 1368[b]7–9). (2) "Common [is] what is in accord with nature" (1373[b]6).

Scope: (1) "All law is universal" (*NE* 1137[b]13). (2) "There would need to be laws . . . concerning all of life" (1180[a]3–4). (3) "The law should rule everything" (*Pol*. 1292[a]32–33). (4) It is necessary "for laws to be laid down, but for them not be in control insofar as they deviate from what is best, although they should certainly be in control everywhere else" (1286[a]22–24). (5) "It is fitting for laws that are correctly laid down to define everything themselves, wherever possible, and leave the fewest things up to the judges" (*Rh*. 1354[a]31–34). (6) "To seek to be wiser than the laws is the very thing that is forbidden in the laws that are praised" (1375[b]23–25).

Aim: (1) "The laws . . . pronounce about all matters, aiming either at the common advantage of all or at that of the best people or of those who—in accord with their virtue or in accord with some other such thing—are in control. So, in one way, the things we call 'just' are the ones that produce and safeguard happiness and its parts for the political community" (*NE* 1129[b]14–19). (2) "The law prescribes living in accord with each virtue and forbids living in accord with each depravity" (1130[b]23–24).

Limitations: (1) "About some sorts of things it is not possible to pronounce correctly in universal terms" (*NE* 1137[b]14). (2) "This is the very nature of the decent—a rectification of law insofar as it is deficient because of its universality" (1137[b]26–27).

Role in constitutions: (1) "It is with a view to the constitution that the laws must be laid down. But if this is so, it is clear that laws that are in accord with correct

constitutions must be just, and those in accord with deviant constitutions not just" (*Pol*. 1282^{b}10–13). (2) "The separate laws . . . are among the things that make clear what the constitution is" (1289^{a}18–19). (3) "Where the laws do not rule there is no constitution" (1292^{a}32).

Legetai: **Said to Be**

Legislative Science (*nomothetikê*): Legislative science is an architectonic sub-branch of politics (political science) that drafts universal prescriptive laws with the aim of furthering the happiness of citizens by inculcating the virtues in them and directing their actions (*NE* 1180^{b}23–28) but is also concerned with constitutional questions more broadly (*Pol*. 1288^{b}21–1289^{a}15). Hence a politician who practices it must know, e.g., when a particular city would most benefit from having an oligarchic constitution and how to establish and preserve such a constitution (even if it is not the unconditionally best one) by enacting laws that preserve it and further its ends. Since not everything can be exactly defined, even maximally exact laws cannot obviate the need for deliberation altogether (1287^{b}22–23, *Rh*. 1374^{a}26–^{b}23). Besides an architectonic legislative component, politics thus also needs a deliberative one, which, among other things, issues decrees.

Legislator (*nomothetês*)
A *nomothetês* in the strict sense of the term is someone who possesses legislative science (*nomothetikê*) in its complete, or perfected, form. Most of the actual legislators Aristotle discusses—Phaleas of Chalcedon, Hippodamus of Miletus, Lycurgus, Solon—do not come up to that high standard, as Aristotle's often decisive criticisms of them show. Yet such truth as their proposals do contain constitutes at least some small contribution to legislative science. They are nascent legislators, therefore, who possess nascent (or embryonic) legislative science.

Although "where the laws do not rule there is no constitution" (*Pol*. 1292^{a}32) and some laws make a constitution clear (1289^{a}18–20), there is nonetheless a difference between a constitution and a set of laws (1289^{a}15–25). So there is also a difference between those who craft laws only, and those who, like Lycurgus and Solon, craft a constitution too (1273^{b}32–34). No craft or science is singled out, however, as a specifically constitutional one. But what is said in the following text indicates the difference Aristotle has in mind: "One sort of practical wisdom concerned with the city is the architectonic part, legislative science, while the part concerned with particulars has the name common to both: 'politics.' This part is practical and deliberative. . . . Among the other sorts, one is household management, another legislative science, another politics, and of the latter, one part is deliberative and the other judicial" (*NE* 1141^{b}24–33). It is clear, then, that while a legislator focuses exclusively on a city's laws, a designer of constitutions also includes the management of the city's households as well as its deliberative and judicial functions within his purview.

It is also reasonably clear that "the practical wisdom concerned with the city" has these same things within its purview. But this practical wisdom is "the same state [of

the soul]" as politics, or political science (*NE* 1141^{b}23–24), implying that the science a designer of constitutions needs is precisely politics itself—a description of which is given at *Pol.* 1288^{b}21–1289^{a}25. This would explain why no specifically constitutional science is introduced.

Another relevant distinction is made in the following text: "Some of those who have had something to say about a constitution took no part whatever in political actions, but always lived a private life. . . . Others became legislators, some for their own cities, others for some foreign ones as well, because they engaged in politics themselves" (*Pol.* 1273^{b}27–32). A nascent legislator need not have ever been active in politics or be a citizen of the city for which he is legislating, then, likewise a designer of constitutions.

To become a legislator in the strict sense, a study of collections of laws and constitutions is useful to "people who are able to get a theoretical grasp on them and judge what is correctly done or the opposite and what sorts of things fit with what" (*NE* 1181^{b}7–9).

Legomena: **Say, Things We**

Leiotês: See **Roughness and Smoothness**

Leisure (*scholê*)

Aristotle's way of thinking about leisure overlaps with ours but differs from it in important ways. We think of leisure time as time off work in which we can do as we choose. Aristotle agrees that leisure time and work time are distinct (*Pol.* 1256^{a}32), but he thinks that activities that are entirely leisured must be choiceworthy solely because of themselves. Among these he includes such scientific activities as the exercise of theoretical wisdom or mathematical knowledge, which we might think of as work. In these, he thinks, complete happiness consists (*NE* 1177^{b}19–26).

Entirely unleisured activities are choiceworthy solely because of some additional end, such as producing or providing the necessities of life (*NE* 1176^{b}2–3)—included among these are the canonical productive crafts or sciences (*Met.* 1048^{b}18–35). Activities that are choiceworthy in part because of themselves, and in part because of an additional end, include activities in accord with practical wisdom and the virtues of character. These too constitute happiness, but of a less than complete or secondary sort (*NE* 1177^{b}4–26, 1178^{a}9–22).

Most people would include amusing pastimes as leisured activities par excellence (*NE* 1176^{b}6–17), but Aristotle does not agree. For amusement is not an end, since it occurs "for the sake of activity [in accord with virtue]" (1176^{b}35–1177^{a}1). Nonetheless, because humans do have to engage in unleisured practical and productive activities, in a good political constitution "those introducing amusement should watch for the opportune time to use it, as if dispensing it as a medicine" (*Pol.* 1337^{b}40–42; also 1339^{b}31–42).

Leitourgia: **Public Service**

Lêmê: **Rheum**

Lepidôtos: **Soft-scaled**

Leptos: See **Coarse-grained**

Leukê: **White-sickness**

Lexis: "Expression through use of names" (*Po*. 1450^{b}13–14), but also "speech," "diction," or "style."

Life (*bios, zôê*): *Zôê* typically refers to the sorts of life processes and activities studied by biologists, zoologists, and so on, such as growth, reproduction, perception, and understanding. *Bios* refers to the sort of life a natural historian or biographer might investigate—the life of the otter, the (especially, agentive) life of Pericles—and so to a span of time throughout which someone possesses *zôê* at least as a capacity (*NE* 1102^{b}5–7). Hence we are reminded that a certain *zôê* will not be happiness for a human being unless it occurs "in a complete *bios*" (1098^{a}18–20). But the two notions are often more or less equivalent.

Light (*phôs*): "Light is the activity . . . of the transparent insofar as it is transparent." (*DA* 418^{b}9–10).

Likelihood (*eikos*): (1) "A likelihood is an acceptable premise (for what people know happens or does not happen for the most part, or is or is not so for the most part, is a likelihood)" (*APr*. 70^{a}2–5). (2) "A likelihood is what comes about for the most part, not however simply so, . . . but rather when it concerns things that admit of being otherwise, standing in relation to what it is a likelihood in relation to as the universal stands to the particular" (*Rh*. 1357^{a}34–^{b}1). (3) When it is *eikos* that something is so, it "makes perfect sense" that it is so.

Limit (*peras*): The focal discussion is *Met*. 5.17.

Liparos: **Oily**

Logico-linguistic (*logikos*)
The adjective *logikos* is used to distinguish a set of propositions and problems from those belonging to natural science or ethics: "Premises such as the following are ethical—for example, whether one must obey one's parents rather than the laws, if they disagree; logico-linguistic—for example, whether the science of contraries is the same or not; natural scientific—for example, whether the cosmos is eternal or not. And similarly for the problems" (*Top*. 105^{b}21–25). Since the question about a science of contraries is a philosophical one (*Met*. 996^{a}18–21), *logikos* problems overlap with philosophical ones. At the same time, if an argument is from "false but acceptable premises, it is *logikos*" (*Top*. 162^{b}27), suggesting that *logikos* arguments overlap with dialectical ones, since both may rely on acceptable beliefs (*endoxa*) or—more or less equivalently—on things said (*legomena*) or things that appear to be so about the issue.

When Plato, unlike previous thinkers, is accorded a share of dialectic it is due to his investigation of *logoi* or accounts (*Met*. 987^{b}31–33), which he almost always undertook

through staged Socratic conversations, whose aim was to discover the correct definition (1078^{b}23–25) of what something essentially or intrinsically is, or is itself-by-itself (*auto kath' hauto*)—the "itself" in the name of a Form probably stems from its being the ontological correlate of such a definition (1040^{b}32–34). One core meaning of *logikos*, in fact, relates it to conversation and speaking, while another relates it to reason. When we ask *logikôs* (adverb) why it is that these bricks and stones are a house, what we are asking for is a formal cause or an essence (1041^{a}26–28), which is presumably why a deduction of the essence is a *logikos* deduction (*APo*. 93^{a}15).

When dialecticians are contrasted with natural scientists, it is on the grounds that "the natural scientist gives the matter, the dialectician the form and the account" (*DA* 403^{b}1–2)—again associating dialectic with proceeding *logikôs*. The dialectician proceeds *logikôs*, the natural scientist *phusikôs*—looking to matter but also to form, when the relevant essence requires it: "[that] is why it belongs to the natural scientist to get a theoretical grasp even on some of the soul, that is, on as much of it as is not without matter" (*Met*. 1026^{a}5–6). So to proceed in a strictly *logikôs* way, when there is empirical evidence bearing on the subject, is bad science (*DA* 402^{b}17–403^{a}3).

Before we start defining essences logico-linguistically, then, we should have intimate knowledge of the empirical data that they are supposed to explain (*GC* 316^{a}5–11). A frequent criticism of Plato and the Platonists is that, in proceeding logico-linguistically, they leave the earth and the world of facts too far behind and proceed at too abstract and general a level (*Met*. 987^{b}29–988^{a}7, 1069^{a}26–28). The "craftsmen of logico-linguistic arguments" (*EE* 1221^{b}7) are those who produce sophistries. When the perceptual data are scarce, however, it is still possible to make some scientific headway. Astronomy is a case in point. Our theoretical knowledge of the heavenly bodies is relatively slight, "for both about the things on the basis of which one would investigate them and the things about them we long to know, the things evident to perception are altogether few" (*PA* 644^{b}25–28). There are many puzzles in astronomy, therefore, about which we can do little but conjecture, since "we think that we have given a sufficiently rational demonstration about things inaccessible to perception, if we lead them back to what is possible" (*Mete*. 344^{a}5–7), given the available appearances. "To become a little more puzzle-free" in areas like these is the most we can hope for until further perceptual data (*Cael*. 291^{b}24–28) and better theories (*Met*. 1073^{b}13–17) become available.

Logikos: **Logico-linguistic**

Logos

An important notion—or, better, a series of connected notions—in Aristotle. In many instances a *logos* is a reason, or a capacity to give reasons. As the latter, it is located in each of the two sub-parts of the part of the soul that has it, the scientific part and the rationally calculative or deliberative part (*NE* 1139^{a}3–14), and is contrasted with the desiring part of the soul (comprising appetite, spirit, and wish), which shares in reason "insofar as it is able to listen to reason and obey it" (1102^{b}31), but cannot give reasons, whether scientific or deliberative.

In a related sense *logos* is what reasons, reasonings, and thoughts more generally are typically expressed and communicated in: "A *logos* is a significant voiced sound, some part of which is significant in separation—as a phrase but not as an affirmation" (*Int*. 16^{b}26–28). A *logos* of this sort is a "saying." This may be a single name or word, but when it is assertoric it always involves a name and a verb, and is either true or false (17^{a}2–3, *Cat*. 2^{a}4–7), and may be either an affirmation or a negation. A premise in an argument is thus "a *logos* that affirms or negates something of something" (*APr*. 24^{a}16–17). This sort of *logos* is a "sentence." A combination of sentences may itself result in a *logos*, namely, an "argument"; for "arguments are from premises" (*Top*. 101^{b}15–16). Speech, the capacity to say things and utter sentences, is also *logos*: "speech is for indicating what is advantageous or harmful, and so too what is just or unjust" (*Pol*. 1253^{a}14–15).

The *logos* of N is something that can replace the name "N" because it signifies the same thing as "N" (*Cat*. 1^{a}1–2, *Top*. 101^{b}38–102^{a}1, *Ph*. 184^{b}10, *Met*. 1006^{b}1–2, 1030^{a}7–8). This sort of *logos* is an "account." One important sort of account is a definition (*Top*. 101^{b}38). The form that is in accord with the *logos* (in the sense of a definitional account) is sometimes itself referred to as a *logos* (*DA* 412^{b}16, 414^{a}28) or definition (*Met*. 1086^{b}3–4).

In various contexts, including mathematical ones, a *logos* is a ratio (*Mete*. 379^{b}35, *DA* 424^{a}28), and when it is contrasted with a work (*Rh*. 1371^{b}23) or with a thought (1374^{b}12), it is a word.

Love (*philein*, *philia*): See **Friendship**

Love, Object of (*to philêton*): What friends do is love (*philein*) each other. The object of love (or the lovable) is that feature in a person (such as his virtue or his being a source of pleasure or utility) that attracts his friend's love to him.

Luck (*tuchê*): What happens because of luck in the broad sense is what happens coincidentally or contingently (*APo*. 87^{b}19–22), so that luck in that sense is pretty much the same as the chance or spontaneity (*to automaton*) that applies to all those things "whose cause is indefinite, which do not occur for the sake of anything, or always, or for the most part, or in some orderly way" (*Rh*. 1369^{a}32–34). But in a narrower sense, which is contrasted with chance, what happens by luck is what has a coincidental final cause: "Luck is a coincidental cause in things that come about in accord with deliberate choice for the sake of an end" (*Met*. 1065^{a}30–31). So, if a tree's being by the back door is the sort of thing that might be an outcome of deliberative thought, it is a candidate final cause of action—an end we aim at (*Ph*. 197^{a}5–9, ^{b}20–22). If wish, which is the desire involved in deliberation and deliberate choice, is what causes it to be there, the tree's being by the back door has a genuine final cause. If not, its being there has a coincidental final cause. Unlike chance, then, which applies quite generally to whatever results from coincidental efficient causes, narrow luck applies only to what could come about because of action and deliberate choice. Hence it is the sphere relevant to action: "Luck and what is by luck belong to whatever good luck and, in general, action also belong. That is why luck is of necessity concerned with what is

doable in action" (197^{b}1–2). The sphere of narrow luck is thus that of the practical and productive sciences (*Rh*. 1362^{a}2).

Luein, lusis: See **Refute**

Lune (*mêniskos*): See **Quadrature**

Lydian: See **Harmonies**

Majority (*plêthos*): A *plêthos* can be any multitude—any (typically) large group of people. But often it refers to the majority of the citizens of a city, not the majority of its total population (which may include many non-citizens, such as slaves and resident aliens). Because of this the notion inherits some of the problems inherent in the notion of a citizen. When Aristotle tells us that "the belief of the majority" (*Pol*. 1294^{a}12) has control in all constitutions, the majority he is thus referring to is the majority of the unconditional citizens (1275^{a}19–23) who participate in political office. In the case of an aristocracy or an oligarchy, this may be a relatively small number of people.

Makarios: **Blessed**

Malakia: **Soft-bodied Animals**

Malakodermos: **Soft-skinned**

Malakostrakos: **Soft-shelled**

Male and Female (*to arren kai to thêlu*): (1) "The male and the female are distinguished by a certain capacity and a certain incapacity (for what is capable of concocting, composing, and emitting seed containing the starting-point of the form is male—and by 'starting-point' I mean not the sort from which as from matter an offspring comes to be that is of the same sort as the progenitor, but rather the primary moving-producing one, whether capable of producing it within itself or in something else), while what is receptive of seed, but incapable of composing and emitting it, is female" (*GA* 765^{b}9–15). (2) "The female is like a deformed male, and the menses are seed, but not pure seed" (737^{a}27–29). (3) "We must suppose femaleness to be like a natural deformation" (775^{a}15–16). See **Woman**

Mania, Manic (*mania*, *manikos*): Of the relatively few passages in which Aristotle mentions mania in people, the following are perhaps the most illuminating: (1) "Naturally clever stock degenerates into rather manic characters (for example, the offspring of Alcibiades and of Dionysius), while steady stock degenerates into stupidity and sluggishness" (*Rh*. 1390^{b}28–31). (2) "The craft of poetry is for the naturally clever rather than for the manic person" (*Po*. 1455^{a}32–33). We are not, then, always dealing with literal madness (as at *Ath*. 56.6) but with something more like an overly excited, frenzied condition—a state of "possession"—that may be episodic. *Mania* in other animals, though, does seem to be a sort of madness, as in rabid dogs (*HA* 604^{a}6).

Mannikin (*kanabos*): Apparently, an outline drawing of the human body in which, e.g., its blood vessels can be seen. See *HA* 515^{a}35, *GA* 743^{a}2.

Margites: A lost Homeric burlesque recounting the deeds of a ridiculous hero.

Marriage (*gamos*): Focally discussed in *NE* 8.12, *Pol*. 1.12–13, 7.16.

Marrow (*muelos*): "A certain nature of blood" (*PA* 651^{b}20); "the residue of nourishment from the blood, distributed to bones and fish-spine, when it has been concocted and enclosed" (652^{a}21–23).

Master (*despotês*): Someone who (in the best case) exercises the rule of a master (*despotikê*) over natural slaves in accord with the craft or science of mastership. Discussed in *Pol*. 1.7.

Mates, Is Mated (*ocheuein*, *ocheuesthai*): The male mates (active); the female is mated (passive). Sometimes "mounts" is used for (active) mating to avoid ambiguity (*HA* 614^{a}3–10).

Mathematics (*mathêmatikê*): Many theorems in mathematics are special to some branch of it, such as arithmetic or geometry, but there are also "certain propositions stated by the mathematicians that are universal" (*Met*. 1077^{a}9–10), e.g., that proportionals alternate (*APo*. 74^{a}17–25). Nonetheless, the universality of the demonstration is open to challenge on the grounds that lines and numbers differ in kind. For "the extreme and middle terms [in a demonstration] must be from the same kind" (75^{b}10–11), so that kind-crossing demonstrations are ruled out: "it is impossible for what is proved to cross from one kind to another" (84^{b}17–18). Hence the causes due to which the theorem about proportionals holds in the case of lines and of numbers are distinct (99^{a}8–9), and so separate demonstrations seem to be needed in the case of each. But "insofar as admitting of a certain sort of increase" (99^{a}9–10), the demonstration is the same, so that the theorem is "common to all quantities" (*Met*. 1061^{b}19–21). For while "the kinds of the beings are distinct," some things "belong to quantities alone and others to qualities alone, and it is with the help of these that a proof is given through the common things" (*APo*. 88^{b}1–3). But though the universal theorem holds of all quantities, it does so by analogy (76^{a}37–41). Therefore, the kind to which lines, numbers, and so on belong, which is the ontological correlate of a theorem of universal mathematics, is not a first-order kind, but an analogical unity—a quantity—but no less robust for that. The differences between mathematics, natural science, and primary philosophy or science are discussed in *Met*. 6.1, and the nature of mathematical entities in 13.1–3.

Matter (*hulê*): (1) "By 'matter' I mean the first underlying subject of each thing from which it comes to be and which is present in it non-coincidentally" (*Ph*. 192^{a}31–32). (2) "By 'matter' I mean that which, intrinsically, is neither said to be a something, nor a quantity, nor anything else by which being is given definition" (*Met*. 1029^{a}20–21). (3) "By 'the matter' I mean what, though not actively a this something, is potentially a this something" (1042^{a}27–28). (4) Matter is "what is potentially . . . directly and

intrinsically" ($1070^{b}12–13$). (5) The final matter is that of "what is most of all substance" ($1070^{a}20$). (6) "Where what is predicated is a form and a this something, the ultimate underlying subject is matter and material substance" ($1049^{a}35–36$). (7) "Some matter is perceptible, . . . while some is intelligible—perceptible matter being, for example, bronze, wood, and any matter that is movable, and intelligible matter being the sort that is in the perceptible things but not insofar as they are perceptible, such as the objects of mathematics" ($1036^{a}9–12$). (8) Perceptible matter comes in a variety of different sorts. Movable matter, mentioned at $1036^{a}10$, is the sort something needs if it is to be capable of moving from place to place. Hence it is also referred as "matter for change of place" ($1042^{b}6$). Matter for alteration is the sort that things need if they are to change in quality ($1050^{b}16–18$). Then there is matter needed for movement with respect to magnitude, or increase and decrease (*Ph.* $260^{a}27$). And finally the matter needed for coming to be and passing away, which is most of all matter in the strict sense (*GC* $320^{a}2$). Things that have perceptible matter but not matter for coming to be or passing away include the various heavenly bodies (*Met.* $1050^{b}22–28$, $1069^{b}24–26$). (9) Intelligible matter is mentioned by name only at $1036^{a}10$, $1037^{a}5$, and $1045^{a}34$. But "the matter of the objects of mathematics" ($1059^{b}16$) is fairly certainly a reference to the same—or same sort—of thing.

Matter, Hypothetically Necessary: "Why is a saw such as it is? So that this may be, and for the sake of this. But in fact it is impossible that this thing that the saw is for the sake of should come to be, unless the saw is made of iron. It is necessary, therefore, for it to be made of iron, if there is to be a saw and its work. The necessity, then, is hypothetical, but not [necessary] as an end; for the necessity lies in the matter, while the for-the-sake-of-which lies in the account" (*Ph.* $200^{a}10–15$).

Matter, Intelligible (*noêtê*)

When a mathematician draws a particular equilateral triangle ABC in chalk on a blackboard, he uses it to represent an abstract particular equilateral triangle <ABC> whose sides are perfectly straight, exactly equal mathematical lines that have length but no breadth. <ABC> is an intelligible mathematical object. When he draws a second equilateral triangle DEF in order, e.g., to prove that <ABC> and <DEF> are congruent, what distinguishes these two abstract mathematical triangles from each other is not their form or shape, which is the same in both, but their distinct parcels of matter, and which are the abstract analogs $<m_1>$ and $<m_2>$ of the different parcels of perceptible matter, m_1 and m_2, consisting of chalk and areas of blackboard, that distinguish ABC from DEF (*Met.* $1034^{a}5–8$). <ABC> and <DEF> are particular abstract triangles, just as Callias and Socrates are particular non-abstract humans. And as the universal human is a sort of compound of this form (defined by the account of human) and this matter taken universally ($1035^{b}27–30$), so the universal mathematical triangle is a compound of the form (defined by the account of equilateral triangle) and something else. And this something else is not $<m_1>$ or $<m_2>$, which are distinct parcels of intelligible matter—this being the sort that is "in the perceptible things but not insofar as they are

perceptible" (1036^{a}11–12). Instead it is the abstract universal material of which they are instances—the analog, in other words, of the non-abstract universal material of which m_1 and m_2 are distinct instances.

It is this universal analog that the following text describes: "Of matter, there is some that is intelligible and some that is perceptible, and one part of the account is always the matter and the other the activation—for example, the circle is shape plus plane" (*Met*. 1045^{a}33–35). Here plane is the universal material component of the account or definition of the universal circle, and so of the universal equilateral triangle as well. It is thus a special case of intelligible matter. For what mathematicians leave behind when they do their abstracting from perceptibles is "only the quantitative and the continuous, sometimes in one, sometimes in two, sometimes in three dimensions, and the affections of things insofar as they are quantitative and continuous" (1061^{a}32–35). Intelligible matter taken universally, then, is the continuous—the abstract analog of physical space that the quantitative divides up (notice "lines and the continuous" at 1036^{b}9–10), and so make intelligible mathematical objects divisible.

Matter, Primary (*prôtê*)

At *GA* 729^{a}32 the female menses, which are obviously not intrinsically featureless, are said to correspond to *prôtê hulê* because they provide the matter for the embryo, not the form. At *Met*. 1015^{a}7 *prôtê hulê* is a thing's matter-based nature, which would be water "if all meltable things are water." At 1014^{b}32 it is the matter from which a thing is first made. At 1017^{a}5–6, where it is contrasted with ultimate matter, it is "divisible in form," and so must have a form. At 1044^{a}23, it is contrasted with ultimate matter. At 1049^{a}24–27, fire would be *prôtê hulê* if other elements were composed of it, but not it of anything else. From this survey it is clear that Aristotle does not use *prôtê hulê* to refer to intrinsically featureless (or so-called prime) matter.

Better evidence for a commitment to such matter is provided by the problem of elemental transformation. The elements earth, water, air, and fire, which are by definition the most primitive of sublunary bodies, can nonetheless change into one another in a way determined by their ultimate differences—hot, cold, wet, dry. If elements are adjacent, so that like earth and water, they share a difference, transformation occurs when one of the differences masters its contrary (*GC* 331^{a}27–30). Suppose, then, that earth (E) is first transformed into water (W), then into air (A), then into fire (F), so that m (the underlying subject requisite for all change) is E at t_1 and W at t_2 and A at t_3 and F at t_4. Since m underlies all elemental transformation, it cannot have any of the ultimate differences as an intrinsic affection: if it did, it would not be able to lose them. But because these differences are the ultimate ones, there are no others m can possibly have (329^{a}10–13). So it must have these differences, but not in the same way as the elements themselves (329^{a}24–35): fire is essentially or intrinsically hot, whereas m, while it may in fact be hot, must also be potentially cold, and so must be hot only coincidentally. For matter is that which "directly and intrinsically" is potentially hot, cold, and the rest,

without being any of them intrinsically or actually (*Met.* 1070^{b}12–13). It seems, then, that m must be intrinsically featureless matter.

However, if m is to underlie elemental transformation, a numerically identical portion or quantity of it must persist through the transformation: "The thing (whatever it is) by being which it underlies is the same, but its being is not the same" (*GC* 319^{b}3–4). But because it seems to possess none of the ultimate contrary differences intrinsically, such a portion of intrinsically featureless matter seems to impose no constraints whatsoever on element transformation. So, at the elemental level (and hence on up), anything could come from anything. But this Aristotle rules out: things cannot come to be from or pass away into just any random thing (*Ph.* 188^{a}31–^{b}8). Since elemental transformation is not in fact indiscriminate, then, but is constrained by the causal relations holding between the ultimate differences, m's defining potentialities must themselves be constrained by these causal relations. That is why Aristotle can simultaneously think that the elements come to be from *prôtê hulê*, and that they come to be from each other: "Since the elements cannot come to be either from an incorporeal thing or from another body, it remains for them to come to be from each other" (*Cael.* 305^{a}31–32). What an element comes from, then, is another element, but what underlies the transformation of one into the other is *prôtê hulê*, which is not a body separate from the elements, and has no essential or intrinsic affections besides the potentialities determined by the causal relations between the ultimate differences. *Mete.* 378^{b}34 and 379^{b}19–20 thus identify matter with the affectable capacities, namely, dry and wet.

Normally, a thing's potentialities or dispositional properties are based in its actual or categorical properties, as table salt's solubility in water is based in its molecular structure. But when we get down to ultimate components, there may be no base of this sort, as may be true in the case of mass or gravitational attraction. At that point, what we confront are dispositions or potentialities that are simply brute. All we can say is that m is something that (a) when coincidentally cold and dry (earth) has the potentiality to become cold and wet (water), and (b) when coincidentally cold and wet (water) has the potentiality to become hot and wet (air), and (c) when coincidentally hot and wet (air) has the potentiality to become hot and dry (fire), and (d) when coincidentally hot and dry (fire) has the potentiality to become cold and dry (earth). The higher-order disposition that m possesses to behave in these four ways but not in others shows that it is not a parcel of featureless matter, which is without dispositions as well as in all other ways indefinite. These causal continuities exhibited across the four ways explain why m is the same thing throughout them. Indeed, causal continuity is what explains the diachronic identity of substances themselves.

Matter, Ultimate (*eschatê*): Ultimate—or "proximate"—matter (*Met.* 1035^{b}30, 1045^{b}18) is the matter in which the relevant form is first present. It is referred to as "ultimate" or "last" because in the process of producing matter suitable for receiving the form it comes last. In the case of a statue, this might be bronze, which is produced from copper and tin. In the case of Socrates, it is the matter (namely, his mother's

menses as first set in form-transmitting motions by his father's seed to produce his own fetal heart) that constitutes him when he first comes to be a this something (*GA* 767^{b}29–36).

Maxim (*gnômê*): "A maxim is an affirmation . . . about universals, and not about all of them . . . , but about the things that actions have to do with, and with things that are to be chosen or avoided with a view to doing an action" (*Rh*. 1394^{a}21–26).

Mean, Middle, Intermediate (*mesotês*, *meson*): (1) "Things are said to have a *meson* in many ways" (*Top*. 149^{a}35–36). (2) "We say that those things are intermediates into which what changes must change earlier" (*Met*. 1057^{a}21–22). (3) "The intermediates are all in the same kind, intermediate between contraries, and all composed of the contraries" (1057^{b}32–34). The ethical mean is discussed in *NE* 2.8–9.

Mean, Perceptual: Mentioned at *DA* 431^{a}11, the perceptual mean is the constituent in a perceptual part that functions like a laboratory balance or weighing scale enabling it to detect differences in proper perceptibles, which activate it by tilting it, as it were, one way or another (424^{a}5–9). Depending on the makeup of these perceptibles, the activation of the perceptual modality is either pleasant or painful (426^{b}4–9). It is pleasant provided it is within the limits determined by—or consonant with—the ratio of the perceptual modality (and is painful otherwise). More precisely, since a perceptual modality works better within some areas of its range of operation than others, so that we see better in brighter light than in dimmer, perception is pleasant in the optimal range, the range of maximal consonance (*NE* 1174^{b}18–20). The better-known ethical mean piggybacks to some extent on the perceptual one, since the virtues of character are all involved with pleasures and pains and our correct perception and response to them.

Measure (*metron*): "That by which a quantity is known, and a quantity insofar as it is a quantity is known either by a one [or unit] or by a number, and all number by a one, so that all quantity insofar as it is quantity is known by the one, and what quantities are primarily known by, this is itself one" (*Met*. 1052^{b}20–23). See **Meter**

Mêkôn: A sort of digestive residue in the shelled animals (*HA* 529^{a}11–12, ^{b}10–11).

Melagcholikos: **Impulsive**

Memory (*mnêmê*): "Neither perception nor supposition but rather a state or an affection of one of these when time has passed" (*Mem*. 449^{b}24–25). Remembering is "the having of an appearance as a likeness of what it is an appearance of . . . [in] the primary perceptual [part], that is, the one by means of which we perceive time" (451^{a}15–17). The important distinction between remembering (*mnêmoneuein*) and recollecting (*anamimnêskesthai*), which tracks that between perceptual imagination and deliberative imagination, is discussed at 453^{a}9–14.

Menses (*katamênia*): See **Form, Transmission of**; **Seed**

Metablêtikê: **Exchange, Craft of**

Metaphor (*metaphora*): "The application to something of a name belonging to something else, either from kind to form, from form to kind, from form to form, or by analogy" (*Po*. 1457^{b}6–9).

Metaphysics

Metaphysics is the science of being qua being, which Aristotle calls "primary science" or "primary philosophy" (*Met*. 1026^{a}16, 1026^{a}24) and which we call "metaphysics," after the Greek title of the work (assigned by later editors) in which it is developed: *Ta Meta ta Phusika*. Unlike each of the special sciences, the science of being qua being gives us a picture not of a piece of the world, a region of being, but of the world these sciences collectively portray, which emerges from a meta-level, empirical investigation of the special sciences themselves. As each of these looks for universals (natural kinds) that stand in demonstrative causal relations to each other, so this meta-level investigation looks for higher-level universals that reveal the presence of common structures of explanation—form, privation of form, matter—in diverse sciences (*Met*. 1070^{a}31–^{b}21).

The special sciences show the presence in the world of a variety of *different* explanatory structures. The kind-crossing (or trans-generic) sciences, by finding commonalities between these structures, show the equally robust presence there of the *same* explanatory structure. The science to which form, privation of form, and matter belong is, in the first instance, kind-crossing natural science. It is the one that would be the primary science, were there no eternal immovable substances separable from the natural ones. But there is also a kind-crossing—or universal—mathematical science (*Met*. 1026^{a}13–23). And the introduction of intelligible matter (1036^{a}11–12), as the matter of abstract mathematical objects, allows us to see a commonality in explanatory structure between the mathematical sciences and the natural ones.

Between these two kind-crossing sciences and the theological one (*Met*. 1026^{a}19), on the other hand, the point of commonality lies not in matter, since the objects of theological science have no matter (1071^{b}20–21), but rather in form. For what the objects of theology, divine substances (which includes human understanding or *nous*), have in common with those of mathematics and natural science is that they are forms, though—and this is the crucial point of difference—not forms in any sort of matter whatever. That form should be a focal topic of investigation for the science of being qua being is thus the result of an inductive or empirical investigation of the various special sciences, and then of the various kind-crossing ones, which shows form to be the explanatory feature common to all their objects—to all beings. It is this empirical fact that provides the science of being qua being with a genuine kind-crossing object of study, thereby legitimating it as every bit as much a science as any generic-specific one. The science of being qua being is accordingly a science of form.

The question of how that science can at the same time be theology, the science of divine substance, is answered at *Met*. 1026^{a}23–32. So the primacy of theology, which is based on the fact that theology deals with substance that is eternal, immovable, and

separable, is supposedly what justifies us in treating it as the universal science of being qua being.

Meter, Poetic (*metron*): Paean: ˘˘˘ – (3:1); heroic: – ˘˘ (1:1); iambus: ˘ – (1:2); trochee: – ˘ (2:1). Where –= ˘˘.

Methodical Inquiry (*methodos*): Aristotle's treatises are typically self-described as methodical inquiries: *APr*. 46^{a}32, *Top*. 100^{a}18, *SE* 172^{b}8, *Ph*. 200^{b}13, *GC* 327^{a}31, *Mete.* 338^{a}25, *DA* 402^{a}16, *HA* 491^{a}12, *PA* 642^{b}3, *GA* 742^{b}10, *Met.* 983^{a}23, *NE* 1094^{b}11, *EE* 1214^{a}13, *Pol.* 1260^{b}36, *Rh.* 1355^{b}22, 1410^{b}8, *Po*. 1447^{a}12. In many cases such inquiries provide scientific knowledge (*Ph*. 184^{a}10–13), or, if not scientific knowledge, then a sort of educatedness (*PA* 639^{a}1–4).

Mêtra: **Womb**

Metron: **Measure**

Midriff (*phrenes*): See **Diaphragm**

Mimêsis: **Imitate, Imitation**

Mixolydian: See **Harmonies**

Mixture (*mixis*): Aristotle distinguishes between a mechanical mixture and a chemical one, which involves the formation of a new homogeneous stuff with new emergent properties: "*mixis* is the unification of mixable things when they have been altered" (*GC* 328^{b}22). A blend is a *mixis* particularly of liquids: "a *mixis* of dry things is not a blend" (*Top*. 122^{b}31).

Mnêmê: **Memory**

Mole (*mulê*): A uterine hydatidiform mole is a rare mass or growth that forms inside the uterus at the beginning of a pregnancy. It results from the abnormal fertilization of the egg, resulting in an abnormal fetus. There is little or no growth of fetal tissue. But the placenta grows in the usual way, eventually forming a mass of placental tissue. Molar pregnancies are discussed in *GA* 4.7.

Molunsis: **Parboiling**

Monarchy (*monarchia*): Rule by one person. Kingship is its correct, and tyranny its deviant, form.

Monas: **Unit**

Money (*nomisma*): Money (*nomisma*) is a medium of exchange, a unit of value, and a way of storing wealth for future use (*Pol*. 1.9). And "since it measures everything," it also measures excess and deficiency and how many shoes are equal to a house or food, and thus is "a sort of mean" (*NE* 1133^{a}20).

Monotokos: **One-offspring-bearing**

Monstrosity (*teras*): (1) "What is not like its parents is already in a certain way a monstrosity; for nature in these cases has in a certain way deviated from the kind" (*GA* 767^{b}5–6; also 770^{b}5). (2) "The monstrosity is among the things that are contrary to nature, not contrary to all nature, but the one that holds for the most part" (770^{b}9–11).

More and the Less, the (*to mallon kai to hêtton*)
The more and the less corresponds to our notion of degree, and so is connected to the notion of increasing and decreasing, tightening and loosening. As a musician tightens or loosens his instrument's strings until a certain target note is struck (*Pol*. 1290^{a}22–29), so it is too with vocal cords, sinews, and other string-like things (*GA* 787^{b}10–788^{a}6). As a result, Aristotle employs the notion of tightening and loosening wherever a certain tripartite structure is thought to exist, consisting of a continuous underlying subject, a pair of opposed affections that can vary in degree, and a target, typically a mean or intermediate condition of some sort, that can be achieved by tightening or loosening the underlying subject to change the degree of the affections. Consequently, he speaks of tightening and loosening in characterizing a wide range of phenomena, from the parts of animals to political constitutions (*Pol.* 1309^{b}18–31, *Rh*. 1360^{a}23–30).

In the case of noses and other such parts, the continuous underlying subject is flesh and bone, the pair of opposite affections is hooked and snub, and the target—which lies somewhere in between the two, and so (as in political constitutions) in a mean of some sort—is being a straight nose, or at the very least a nose of some sort. In the case of colors too, while many are constituted out of white and black in some definite ratio, others are constituted "with some excess and deficiency that is incommensurable" (*Sens*. 439^{b}30), and so are apt for tightening and loosening.

Because *to mallon kai to hêtton* is found in many different kinds, it cannot be the subject matter of any of the first-order sciences, since these are restricted to a single kind, but is instead studied by dialectic (*Top*. 114^{b}37–115^{a}24) and rhetoric (*Rh*. 1397^{b}12–27), which are kind-crossing—or trans-generic—sciences.

Most Part, for the (*hôs epi to polu*)
One might think that *hôs epi to polu* simply means "most" (Most As are Bs) in contrast to "all" (All As are Bs), but it does not. For, first, All As are Bs can hold for the most part—"for the most part, all [crabs] have the right claw larger and stronger than the left" (*HA* 527^{b}6–7)—as can universal laws (*NE* 1137^{b}15–16). Second, deductions with universal premises and conclusions remain valid even when these hold only for the most part (*APr*. 43^{b}32–36). But the corresponding deductions with "most" in place of "all" are not always valid: most centenarians are women; most women are under seventy; but no centenarians are under seventy. What is rather the case is that *hôs epi to polu* is a special sort of necessity with a special sort of explanation.

Aristotle associates what holds by unconditional necessity with what holds always: "'necessary' and 'always' go together (for what it is necessary for there to be cannot not be)" (*GC* 337^{b}35–36). He associates what holds *hôs epi to polu* with what rarely fails

to happen (*Top.* 112^{b}10–11), and attributes its existence to matter: "Nature . . . tends to measure comings to be and endings by the number of these revolutions [of the sun and moon], but cannot bring this about in an exact way because of the indefiniteness of matter, and because many starting-points exist that impede their comings to be and passings away from being in accord with nature, and often cause things to happen contrary to nature" (*GA* 778^{a}4–9).

Since the "indefiniteness of matter" seems to be a standing condition, while the "many starting-points . . . which impede" are not, we should presumably divide things up as follows. The indefiniteness of matter explains why laws or theorems of natural science hold *hôs epi to polu*, and so have contraries that are rarely true, while impediments explain why what otherwise would occur rarely may occur quite often. All human beings are two-footed, and this would still hold *hôs epi to polu* even if some freak accident or genetic disorder resulted in all or most human beings having only one foot. For even under normal conditions a human offspring may be born with only one foot simply due to facts about his father's seed (form) and his mother's menses (matter). Because "all human beings are two-footed" admits of exceptions—or of being otherwise—for these reasons, Aristotle says that the necessity it involves is not continuous (*APr.* 32^{b}6). What *hôs epi to polu* really means, then, is something like "it is a non-continuous or gappy necessity that." See **Form, Transmission of**

Mousikê: **Music**

Movement (*kinêsis*): (1) "The actualization of what is potentially, insofar as it is such, is movement" (*Ph.* 201^{a}9–10). (2) "Movement is the incomplete actualization of what is moveable" (257^{b}8–9). A *kinêsis* in this broad sense is a change (*metabolê*) of any sort. But sometimes it is more narrowly a change of place, so that a coming to be or a passing away is a *metabolê* but not a *kinêsis* (225^{b}7–9). See **Activity**

Mover, Primary (*prôton kinoun*): The immovable mover of everything else, identified with the primary god in *Met.* 12.7–9. The most detailed discussion is in *Ph.*7.1–2, 8.5–10, *Cael.* 292^{b}1–25 and 300^{b}21–25.

Muelos: **Marrow**

Multitude (*plêthos*): See **Majority**

Muraena (*smuraina*): A kind of eel.

Music (*mousikê*): The most detailed discussion is in *Pol.* 8.5–7.

Mutis: The liver (or hepatopancreas) in cephalopods.

Name (*onoma*): (1) When contrasted with a verb, an *onoma* is "a composite significant voiced sound, without a reference to time, no part of which is significant by itself" (*Po.* 1457^{a}10–12). Otherwise it is pretty much just a word. (2) In a stricter sense, an

onoma signifies an account or (in some cases) a definition (*Met*. 1012^{a}23–24, 1045^{a}26) of the form (1035^{a}21) or essence (1029^{b}20) of the thing named.

Nation (*ethnos*): A nation occupied a larger territory than a city (*polis*), had a larger population, and a looser political order. It did not need to have a single urban center and could consist of many scattered villages.

Natural Assimilation (*prosphusis*): A sort of growing together (*sumphusis*) that can lead to the formation of a natural unity (*Ph*. 227^{a}23–24, *Met*. 1014^{b}20–26), but also to such things as Siamese twins: most monstrosities are "due to embryos growing together" (*GA* 773^{a}3–4).

Natural Science (*phusikê*): A science is a natural science if the beings it deals with are "capable of being moved" and if the account of the essences of those beings "holds for the most part only, because it is not separable" (*Met*. 1025^{b}25–28), so that, like the snub, they are "grasped in combination with the matter" (1025^{b}32–33; also *DA* 403^{a}25–^{b}28). See **Most Part, for the**

Natural Science, Appropriate to (*phusikôs*): Often, opposed to logico-linguistic (*GC* 316^{a}10–11).

Natural Scientist (*phusiologos*, *phusikos*): The *phusiologoi* or *phusikoi* (*GA* 741^{b}10) were thinkers who tried to give a general account of reality that, among other things, made no reference to incorporeal beings: "They posit the elements of bodies alone, but not of the incorporeal things, although incorporeal ones are also beings. And when they try to state the causes of coming to be and passing away and to give a natural scientific account of all things, they do away with the cause of movement" (*Met*. 988^{b}24–26). Aristotle uses the terms for the most part to refer to the Ionian philosophers (Thales, Anaximander, Anaximenes, Heraclitus), Empedocles, and the Atomists (Democritus, Leucippus), in contradistinction to the Eleatics (Parmenides, Melissus) and Pythagoreans (*Ph*. 186^{a}20, 187^{a}12, 28, 205^{a}5, *Met*. 1078^{b}19).

Naturally Well-disposed (*euphuês*): Something is *euphuês* (contrary: *aphuês*) if it is well (*eu*) grown (*phuô*), or favored by nature in capacities, appearance, or some other respect: the situation of a bodily organ can be *euphuês* (*PA* 666^{a}14), as can that of a city (*Pol*. 1303^{b}8); an animal can be *euphuês* as regards a work, such as reproduction (*GA* 748^{b}8, 12), or the acquisition of a capacity, such as bearing the cold (*Pol*. 1336^{a}20) or becoming a poet (*Po*. 1455^{a}32) or a musician (*EE* 1247^{b}23). The sort that consists in possession of the natural virtues of character is the sort of natural good judgment (*euphuia*) that makes the end, and the deliberate choice of it, correct (*NE* 1114^{b}8, *EE* 1247^{b}40).

Nature (*phusis*)
Many of the things meant by *phusis* are discussed in *Met*. 5.4. But the term is used more widely than that discussion suggests. In the strict sense, a being that is or does something by nature has a nature—an internal starting-point of movement and rest

(*Ph*. 192^{b}13–14, *Met*. 1015^{a}13–15, *Cael*. 301^{b}17–18). The world of nature, investigated by natural science, is a world of such beings, all of which have perceptible matter as a constituent (*Met*. 1025^{b}30–1026^{a}6). This world is, roughly speaking, the sublunary one. Beyond it lies the world of the heavens studied by astronomy and theology (1026^{a}7–22), where beings either have no matter or matter of a different sort (*Cael*. 269^{b}2–6, 270^{b}19–25, *Mete*. 339^{b}25–27). Although, strictly speaking, many of these beings do not have natures, since "the proper order of perceptible things is nature" (*Cael*. 301^{a}5–6), Aristotle nonetheless speaks of them as if they do (298^{b}23, *Met*. 1026^{a}20, 25). We use the term "nature" in a similar way when we speak of the nature of the numbers or the nature of fictional entities, not meaning to imply at all that these things are parts of the natural world.

Sometimes, instead of using *phusis* to refer to the or a *phusis of* X, Aristotle uses the term and its plural *phuseis* to mean something we translate as "a nature" (Greek has no indefinite article) or "natures." The thing or things referred to may or may not have natures in the strict sense; they are pretty much just entities of some sort.

Aristotle also speaks of *phusis* in agentive terms, as when he says that nature produces nothing pointless or superfluous (*Cael*. 271^{a}33, *DA* 432^{b}21–22, 434^{a}31, *PA* 658^{a}8–9, 661^{b}23–24, *GA* 739^{b}19–20, 744^{a}36–37), does things correctly (*Cael*. 270^{a}20) like a craftsman (*PA* 654^{b}29–32, *GA* 775^{a}21–22), does "what is best from among the available possibilities for the substance of each kind of animal" (*IA* 704^{b}16–17), and corrects imbalances in contraries (*PA* 652^{a}31–33). But, as when he speaks of "the nature of the universe" (*Cael*. 268^{b}11) or "the nature of the whole" (*Met*. 1075^{a}11), it is not entirely clear how literally he is to be taken.

Nature, by (*phusei*)

Things that are "by nature are the ones whose cause is within themselves and is orderly" (*Rh*. 1369^{a}35–^{b}1), which cause is an internal starting-point of "moving and being at rest—some with respect to place, some with respect to increase and decrease, others with respect to alteration" (*Ph.* 192^{b}13–15). And each such thing is a substance: "things that have this sort of starting-point have a nature. And each of them is a substance; for they are a sort of underlying subject, and a nature is always in an underlying subject" (192^{b}32–34). Examples are "animals and their parts, plants, and simple bodies—for example, earth, fire, air, and water" (192^{b}9–11). Non-substantial phenomena, like the upward movement of fire, by contrast, though they occur by or in accord with nature, do not themselves have a nature: "And these things [that are by nature and have a nature] are also in accord with nature, as too is whatever belongs intrinsically to them, as spatial movement upward belongs to fire; for this neither is nor has a nature but is by nature and in accord with nature" (192^{b}35–193^{a}1; also *Cael*. 298^{a}27–^{b}1).

When substantial things do have a nature, moreover, it derives not from their matter but from their distinctive manner of composition, or form: "That is why, as regards the things that are or come to be by nature, although that from which they naturally come to be or are is already present [namely, the matter], we still do not say that they have

their nature if they do not have their form or shape" (*Met*. 1015^{a}3–5). A feline embryo thus has within it a starting-point that explains why it grows into a cat, why that cat moves and alters in the ways it does, and why it eventually decays and dies. A house or any other artifact, by contrast, has no such source within it; instead, "the starting-point is in something else and external" (*Ph*. 192^{b}29), namely, the understanding of the craftsman who produces it (*GA* 730^{b}11–19, *Met*. 1032^{a}32–^{b}10).

Nature, Contrary to: See **Force**

Necessary, Necessity (*anagkaion, anagkê*): Sometimes for A to be necessary is for not-A to be not possible, so that what is necessary cannot be otherwise (*Int*. 22^{b}3–10, *APo*. 71^{b}15, 73^{a}22, *Met*. 1015^{a}33–36). This sort of necessity is the unconditional necessity (*NE* 1139^{b}23–24) possessed by the eternal objects (gods, astronomical objects) of unconditional scientific knowledge. A weaker sort of necessity, in which the necessity is not continuous (*APr*. 32^{b}6), is possessed by things that hold for the most part, as in the case of all of the objects of natural science (*Met*. 1025^{b}28). A third sort of necessity is the hypothetical necessity, focally discussed in *Ph*. 2.9, where a certain sort of matter must be present if a certain compound is to have a certain form or work and achieve its end (also *PA* 642^{a}31–^{b}2). A fourth sort of necessity is the sort involved in a valid deduction, where the conclusion follows of necessity from the premises (*APr*. 24^{b}18–20), though the conclusion will not be necessary unless the premises are; in general, a conclusion can be no stronger than the weakest premise (*APo*. 1.30). All these sorts of necessity are contrasted with what is coincidental or a matter of luck (*APo*. 1.30, *Met*. 6.2–3). Though some of them stem from, or are grounded in, natures, forms, or essences, others are a matter of force, of being necessitated contrary to nature. In the case of actions and the like what is necessitated is compelled, or done under compulsion, and is contrasted with what is done voluntarily (*NE* 3.1).

Negation, Negative: See **Affirmation**; **Privation**

Nemesis: **Indignation**

Noble, Beautiful (*kalos*)
The adjective *kalos* is often a term of vague or general commendation ("fine," "beautiful," "good"), with different connotations in different contexts (*Top*. 106^{a}20–22). Similarly, the adverb *kalôs* often means something like "well" or "correct." Even in the general sense, however, *kalos* has a distinctive evaluative coloration suggestive of "order, proportion, and definiteness" (*Met*. 1078^{a}36–^{b}1), making a term with aesthetic connotation, such as "beauty," seem a good equivalent. Moreover, just as a thing need not have a purpose in order to be beautiful, a *kalon* thing can be contrasted with a purposeful one (*NE* 1125^{a}11–12).

At the same time, it seems wrong always to associate *kalon* with beauty in general, since to be *kalon* a thing has to be on a certain scale: "a *kalon* thing, whether a living being or any object composed of parts, must not only have these properly ordered, but also have a magnitude that is not random—for *kalon* lies in magnitude and order"

(*Po.* 1450^{b}34–37; also *NE* 1123^{b}6–8, *Pol.* 1326^{a}33–34). It is this requirement that makes "nobility" (in its more aesthetic sense) a closer equivalent than "beauty" in many cases.

In ethical or political contexts the canonical application of *kalon* is to ends that are intrinsically choiceworthy and intrinsically commendable or praiseworthy (*EE* 1248^{b}20–21)—and that, as such, are contrasted with things that are compulsory. In the same way, what is ethically *kalon* is contrasted with what is compulsory: "one should be courageous not because of compulsion . . . but because it is noble" (*NE* 1116^{b}2–4). It is because ethically *kalon* actions are intrinsically choiceworthy ends, indeed, that a good person can do virtuous actions both because of themselves (*NE* 1105^{a}32) and for the sake of what is *kalon* (1115^{b}12–13). But *kalon* actions also exhibit the sort of order (1180^{a}18), commensurability or proportionality (1104^{a}18), and determinateness (1106^{b}30, 1170^{a}20) that consists in lying in a mean between two extremes. This brings us full circle, connecting what is ethically *kalon* to what is aesthetically noble, lending the former too an aesthetic tinge.

Finally, what is ethically *kalon* includes an element of self-sacrifice that recommends "nobility," in its more ethical sense, as often a good equivalent for it as well (*NE* 1169^{a}18–22). One reason people praise a *kalon* agent, indeed, is that his actions benefit them (*Rh.* 1366^{b}3–7). But since what is *kalon* is a greater good than those an excellent person gives up or confers on others, there is also a strong element of self-interest in what he does: "The greater good . . . he allocates to himself" (*NE* 1169^{a}28–29). An excellent person does *kalon* actions for their own sake, not for an ulterior motive, because it is only as done in that way that they constitute the doing well in action (*eupraxia*) that just is happiness.

Noble-goodness (*kalokagathia*): Noble-goodness in the strict sense is complete virtue of character. The focal discussion is *EE* 1248^{b}9–1249^{a}17. The term is used elsewhere (*NE* 1124^{a}4, 1179^{b}10, †*MM* 1207^{b}23, *Pol.* 1259^{b}34) with the same sense but with less fanfare. The associated adjectival pair *kalos kagathos* ("noble-and-good") is found, e.g., at *NE* 1099^{a}6, 22, *Pol.* 1270^{b}24, 1271^{a}23, 1293^{b}39, 42, 1294^{a}18, *Ath.* 28.5.

Noêma: **Intelligible Object**

Nomes (*nomoi*): Solo competition pieces: songs accompanied by the singer on a lyre; instrumental solos for the lyre; songs accompanied by the pipe; and instrumental solos for the pipe.

Nomisma: **Money**

Nomos: **Law**

Nomothetês: **Legislator**

Nomothetikê: **Legislative Science**

Nourishment (*trophê*): See **Concoction**

Nous: **Understanding**

Now, the (*to nun*): Focally discussed in *Ph*. 6.3. See **Time**

Number (*arithmos*): The numbers we count with (1, 2, 3 . . .) and the things we count (4 shoes, 2 pairs of shoes) are distinguished at *Ph*. 219^{b}5–8, 220^{b}20–22.

Objection (*enstasis*): (1) "An objection is a premise contrary to a premise" (*APr*. 69^{a}37). (2) "Premises from which it is possible to deduce a contrary result are also those from which we try to state objections" (69^{b}28–29). (3) Objections are brought "in four ways: based on itself, on what is similar, on what is contrary, or on what has been judged" (*Rh*. 1402^{a}34–37). See *Top*. 161^{a}1–15.

Ocheuein, *ocheuesthai*: **Mates, Is Mated**

Offspring (*tokos*): A *tokos* is a child or, more generally, an offspring. *Tokos* also means giving birth.

Oikeios: **Proper**

Oily: *Liparos*

Oligarchy (*oligarchia*): A deviant form of aristocracy, where the rich, whether few (as is usually the case) or many, rule for their own advantage (*Pol*. 1279^{b}7–8), so that it is the rule that "exists because of wealth and power" (*NE* 1161^{a}2–3).

Oligôria: **Contempt**

Oligotokos: **Few-offspring-bearing**

On: **Being**

On Nourishment: Or *On Growth and Nourishment*. Referred to at *DA* 416^{b}31, *GA* 784^{b}2, *PA* 650^{b}10, 674^{a}20, 678^{a}19, and perhaps *Mete.* 381^{b}13, *PA* 653^{b}14.

One (*hen*): A and B can be one (or the same) in different ways: numerically, in form, or in kind (*Top*. 103^{a}6–14), or in being (*Ph*. 202^{b}14–16). Things can be the same in one of these ways without being the same in another: politics and practical wisdom are the same state, but they are not the same in being (*NE* 1141^{b}23–24); the underlying subject that comes to be something, while it may be one in number, cannot be one in form or account (*Ph*. 190^{a}15–17). Being one in number is distinctive of particular this somethings (*Cat*. 1^{b}6, 3^{b}10–13, *Met*. 999^{b}34–1000^{a}1, 1040^{b}9–10, 1086^{b}26).

One, the: (1) "Nature as a whole" (*Met*. 984^{a}31). (2) The Pythagorean one, which is "both odd and even" (986^{a}19–20). (3) The immovable one of Parmenides and his followers (*Ph*. 1.2, *Met*. 986^{b}18–987^{a}2). (4) The Platonic one (*Met*. 987^{b}20–22, 987^{b}29–988^{a}14). (5) The unit of measurement (10.1–2).

Onoma: **Name**

Open-structured: See **Condensation and Rarefaction**

Opportune Moment, Crisis: *Kairos*

Opposite (*antikeimenon*): "Things said to be opposites include contradictories, contraries, relatives, privation and having, and the extremes that comings to be and passings away are from and to. And all things that cannot be present at the same time in what is receptive of both are said to be opposed—either themselves or their components" (*Met*. 1018^{a}20–24). See **Privation**

Opson: **Gourmet Dish**

Ordinary People, the Many (*hoi polloi*): Aristotle sometimes uses *hoi polloi* to refer simply to a majority of people of whatever sort—to most people. Often, though, he uses it somewhat pejoratively to refer to the unrefined masses (*NE* 1095^{b}16 and throughout *Ath*., where it is "the many") in contrast to cultivated, sophisticated, or wise people. "Ordinary people" seems often to convey the correct sense.

Orexis: **Desire**

Organon: **Instrument**

Orgê: **Anger**

Ostrakodermos: **Hard-shelled Animal**

Ousia: **Substance**

Outline, Imprint (*tupos*): (1) Sometimes when Aristotle gives an outline, it means that a fuller account is possible, but not desirable, given the goals of the inquiry. But sometimes, as when things in a given area hold for the most part (*NE* 1104^{a}1–5), it seems that the truth about them *must* be stated in outline (*tupô[i]*). In this case, having to treat things in outline seems to be a function of the subject matter, so that it is because we are discussing things that hold for the most part in ethics and politics that these sciences involve outlining. (2) A *tupos* is also the imprint of a perception that constitutes a memory (*Mem*. 450^{a}31).

Oxfish (*bous*): Cartilaginous fish; one of the selachians.

Oxu: See **Sharp and Dull**

Pachus: **Coarse-grained**

Paideia: **Education**

Paiderasteia: **Boy Love**

Pale: See **White**

Pan, to: **Universe, the**

Pancration: A mixture of boxing and wrestling combined with kicking and strangling.

Para: **Beyond**

Paradigm (*paradeigma*): (1) A rhetorical induction (*APr*. 2.24, *Rh*. 1356^{b}3, *EE* 1216^{b}28). (2) A form (*Ph*. 194^{b}26, *Met*. 1013^{a}27). (3) An example or paradigm case (*Top*. 105^{b}28, 151^{b}20, *GA* 746^{a}14, *EE* 1220^{b}36, *Met*. 995^{a}7, *NE* 1102^{a}10, 1160^{b}23). (4) What a Platonic Form is taken to be (*Met*. 991^{a}21, 1034^{a}2, *NE* 1097^{a}2).

Paradoxos: **Unacceptable**

Paralogismos: **Fallacy**

Parboiling (*molunsis*): "Parboiling is the [sort of] unconcoction that is contrary to boiling. And so the contrary of boiling, and what is called 'parboiling' in the primary sense, would be non-concoction of the indefinite [matter] in the body due to a deficiency of heat in the surrounding liquid" (*Mete*. 381^{a}12–24).

Paronymously (*parônumôs*): "Things are said to be paronymous in case one gets its name from the other with some difference depending on derivation—for example, the grammarian gets his name from grammar, the courageous person from courage" (*Cat*. 1^{a}12–15). Paronymy is not simply a linguistic phenomenon, but also an ontological one, since it is things that are paronymously related not names. The definition of a rash person is thus a person in whom rashness is present, and of a grammarian, a person in whom the knowledge of grammar is present.

Part (*meros*, *morion*): (1) Some parts are uniform, in that they are of the same form as the whole (as parts of water are water and parts of flesh flesh). Others are non-uniform (as parts of the hand are not hands) (*GC* 314^{a}20, 328^{a}10–12, *Mete*. 389^{b}23–28, *PA* 640^{b}20, *GA* 715^{a}8–11). (2) Some are parts of the form of a compound, others parts of the matter (*Ph*. 200^{b}4–8, *Met*. 7.10–11). (3) Some are working parts, that cannot survive (except homonymously) in separation from the working whole, as a separated, non-working hand is a hand in name only (*PA* 640^{b}33–641^{a}6, *Met*. 1035^{b}14–25, *Pol*. 1253^{a}20–25). (4) Parts of substances are sometimes classed as substances (*Cat*. 3^{a}29–32, *Cael*. 298^{a}30–31, *Met*. 1017^{b}10–21, 1018^{b}8–15), but when substance is identified with form, this may no longer be true (*Met*. 1039^{a}3–8, 1040^{b}5–16). See **Soul, Parts of**

Participate (*metechein*): The specifically Platonic relation between particulars and Platonic Forms (*Met*. 987^{b}9, 990^{b}28, 991^{a}21, 992^{a}28, 1031^{b}18, 1079^{a}25, ^{b}25), between Forms themselves (987^{b}21), but also used more generally (*DA* 406^{a}12, 21, 412^{a}15, *Met*. 1030^{a}13, 1037^{b}18, 1039^{b}2, 1045^{b}8, 1075^{a}35).

Particular (*kath' hekaston*): See **This**; **Universal**

Passing Away (*phthora*): See **Coming to Be**

Pathos: See **Affection**

Patrikê: **Fatherhood, Science of**

Patron (*chorêgos*): A rich Athenian who paid for a chorus as part of his public service. See *Ath*. 56.3.

Pêgnunai: **Solidify**

Peirastikê: **Examinational**

Pelamys (*pêlamus*): Variety of tuna.

Pentathlon: Competition comprised of running and jumping, throwing the discus and javelin, and wrestling.

People (*dêmos*): The *dêmos* is the class that rules in a *dêmokratia* ("democracy"), also sometimes called a *dêmos*. It typically consists of the poorer people in the city. The term often refers to democracy itself.

Pepaideumenos: See **Education**

Pepsis: **Concoction**

Peras: **Limit**

Perceptible (Object) (*aisthêton*): Perceptible objects (or perceptibles) are discussed in *DA* 2.6 and are either special to a single perceptual modality, as colors are special to sight, or common to a number of perceptual modalities, as shape can be both seen and felt.

Perception (*aisthêsis*)
The noun *aisthêsis* sometimes refers to a perceptual modality (or sense), such as sight or smell, sometimes to the activity of perceiving some perceptible object. Perception proper encompasses the special perceptual modalities (sight, smell, hearing, taste, and touch), whose primary objects are special perceptibles, such as colors, odors, sounds, and so on, which only a single perceptual modality can detect. But it also includes the common perceptual capacity—or so-called common sense (*DA* 431^{b}6, *Mem*. 450^{a}10–11)—which is the "something" responsible for the awareness of the activity or inactivity of the various special perceptual modalities (*DA* 425^{b}12–26).

The common perceptual capacity is responsible too for the simultaneous perception of two or more special perceptibles in a single act, the perception of two or more proper perceptibles as distinct, the control of waking up the special perceptual modalities or letting them sleep (*Somn*. 455^{a}12–26), and perhaps also the perception of common perceptibles (*koina aisthêta*)—which are accessible to more than one perceptual modality—such as change, rest, shape, size, number, unity, and perhaps others (*DA* 425^{a}13–20).

When we perceive something, as when we beget offspring, what is central to the process is the transmission of form without matter: "Speaking in universal terms about every perceptual modality, one must grasp that the perceptual modality is

what can receive the perceptible forms without the matter, as wax receives the seal of the signet ring without the iron or the gold; it takes on a golden or brazen seal of a signet ring, but not insofar as it is gold or bronze" (*DA* 424^{a}17–21; also 425^{b}23–24). Likewise, memory involves the retention of form without matter (*Mem*. 450^{a}30–32).

Perceptual Affection (*aisthêma*): A perceptual affection is the appearance of a perceptible object retained in memory or present in imagination or in dreams (*APo*. 99^{b}37, *DA* 431^{a}15, 432^{a}9, *Mem*. 450^{a}31, *Somn*. 456^{a}26, 460^{b}29, *Insomn*. 460^{b}2, 29, 461^{a}19, 27, 461^{b}22, 462^{a}30, *Met*. 1010^{b}32, 1063^{b}4).

Perceptual Modality (*aisthêsis*): The five perceptual modalities (or senses) are sight, hearing, smell, touch, and taste. These are focally discussed in *DA* 2.7–11. A perceptual modality's exactness is determined by the "purity" of—the absence of heavy earth in—the associated perceptual organ: the less earthen or corporeal the perceptual organ is, the more easily it is moved by small differences in the perceptible object. The organ of touch, however, involves the flesh as a whole as well as the perceptual organ proper, which lies near the heart (*Sens*. 439^{a}1–2).

Perceptual Organ: *Aisthêtêrion*

Perceptual Part, Perceptual Capacity (*aisthêtikon*): The element in the soul in virtue of which an animal is capable of perceiving. In *DA* 3.4 *to aisthêtikon* is "what is capable of perception." See **Soul, Parts of**

Perhaps, Presumably (*isôs*): *Isôs* sometimes signals tentativeness, sometimes a presumption or probability that something is the case.

Perineon: (1) The part between the anus and scrotum, or anus and vagina (*HA* 493^{b}9), i.e., the perineum. (2) The instrumental part that is special to the male and the counterpart of the uterus in the female, i.e., the penis (*GA* 716^{a}33 and 766^{a}3–5).

Peripeteia: **Reversal**

Perittôma: **Residue**

Pêrôma: **Disability**

Perspicuous, Perspicuousness (*saphês*, *saphêneia*): (1) *Saphêneia* is associated with explanation, which is ultimately from starting-points: "On the basis of what is truly but not perspicuously stated, we will make progress toward perspicuousness, always substituting what is more knowable for what is usually expressed in a confused way. . . . That is why even politicians should not regard as superfluous the sort of theoretical investigation that makes evident (*phaneron*) not only the that but also the why" (*EE* 1216^{b}33–40). The same point is made at *NE* 1098^{b}7–8 by noting that when we have a correct definition of the starting-point, much else at the same time "will become evident (*sumphanê*) through it." *Saphês* and *akribês* ("exact") are often equivalent in

meaning (*Top.* 111^{a}8–9). (2) In a less technical sense *saphês* means "evident" or "clear" (*PA* 661^{a}2).

Persuasion, Means of (*pistis*)

The means of persuasion, which are of cardinal importance in rhetoric, are divided into two classes: (1) some are "outside the province of craft," while others are (2) "within the province of craft" (*Rh.* 1355^{b}35–36).

Those in (1) are special to judicial oratory and there are just five of them: "laws, witnesses, contracts, [results of] torture, and oaths" (*Rh.* 1375^{a}24–25). None of these is a deduction, demonstration, or argument of any sort. This distinguishes them from the means of persuasion that are within the province of craft, which are arguments (1354^{a}12). What they have in common is that they are probative items—items productive of persuasion, or conviction (another meaning of *pistis*): a witness, a contract, or an oath (at least in places where oaths are taken seriously) can be as probative as an argument. What puts these outside the province of craft is not just the fact that they are not arguments, however, but that the craft of rhetoric is not in a position to provide them: they are either there for it at the start or they are not.

In the case of (2), we may distinguish the logical aspects of a means of persuasion from other aspects. From the logical point of view a means of persuasion is a certain sort of deduction or demonstration, and, as such, is no different from any other deduction or demonstration. That is why rhetoric is in part "composed of the science of analytics" (*Rh.* 1359^{b}9–10): it draws its logic from there. What makes a demonstration or deduction a peculiarly rhetorical one—an enthymeme (1355^{a}6, 1256^{b}3)—is not its logic, therefore, but something else, namely, the shape the deduction takes and what it is based on, both of which are dictated by the special goals or purposes of rhetoric.

A primary deduction (*Rh.* 1357^{a}17) is the analog of a dialectical deduction: as the latter lies in the background guiding in the one case the questioner's questions, in the other the answerer's answers, so the primary deduction lies in the background guiding the speaker's enthymeme. And, again like a dialectical deduction, a primary deduction is a syllogistic deduction, or chain of such deductions. By contrast, the enthymeme that the speaker actually presents to his listeners is sculpted to accord with their beliefs (if they know a premise, there is no need to state it), with their capacity to follow long chains of deductions, their level of education, and so on (1395^{b}23–1396^{a}3). In this regard enthymemes are no different from deductions used for other productive or practical purposes (*MA* 701^{a}27–28). An actual enthymeme, then, is always the tip of a deductive iceberg, just enough of which it exposes to achieve its end. But while a speaker "should compress enthymemes as much as possible" (*Rh.* 1419^{a}19), that does not mean that he will never have to expose the whole iceberg.

None of this implies that primary deductions are always explicitly articulated by speakers, or that speakers work from them, as from an explicit recipe, to which they have access. They may be—and no doubt usually are—further removed from actual practice than that. What they do is make fully explicit to students of rhetoric what

is needed in order to rationalize or make fully intelligible what skilled speakers are doing when they argue as they do. They articulate part of the craft knowledge—the competence—of a skilled speaker but not necessarily by giving the protocols he actually follows.

Though their logic is that of deductions generally, enthymemes, like dialectical deductions, are not categorical ones, of the sort found in the sciences, which prove their conclusions unconditionally, but so-called hypothetical ones: "a probative enthymeme draws its conclusion from what is agreed to" (*Rh*. 1396^{b}26–27; also *APr*. 41^{a}38–^{b}1, 45^{b}17–19). But as with their length or degree of compression, this seems to be typically, rather than essentially, true of them (*Rh*. 1358^{a}23–26): the premises of enthymemes may be scientific starting-points even though rhetoric does not select them as such (which is why the speaker who selects them is unaware of the fact that he is doing a bit of science), but on other grounds altogether. (Understood in the way we have been discussing, enthymemes are further divided into two forms: probative and refutative (1396^{b}23–25). But while these differ in their popularity (1400^{b}25–33), they are not two distinct sorts of deductions, but rather the very same one used for distinct purposes (1403^{a}25–29). There is nothing formally or logically distinctive about them, therefore, that requires special notice or discussion.)

What is true of enthymemes formally or logically is also true of what they are based on, namely, "such common things as are, in a way, known to all and belong to no definite science" (*Rh*. 1354^{a}1–3). Later these are identified as including topics (1358^{a}10–12). Then topics themselves are identified with elements of enthymemes. Then both elements and topics are described as items "into the province of which many enthymemes fall" (1403^{a}19). See **Topic**

Phainesthai: **Appear**

Phainomena: **Appear to Be So, Things That**

Phantasia: **Appearance, Imagination**

Phantasma: **Appearance**

Phantastikon: **Imaginative Part**

Phasis: **Phrase**

Phaulos: **Base**

Phiditia: **Communal Messes**

Philanthrôpia: **Fellow Feelings for Human Beings**

Philautia: **Self-love**

Philêton: **Love, Object of**

Philos: **Friend**

Philosophy (*philosophia*): Aristotle sometimes applies the term *philosophia* to any science aiming at truth rather than action (*Met.* 993^{b}20). In this sense of the term, all the broadly theoretical sciences count as branches of philosophy, and *philosophia* is more or less equivalent in meaning to *epistêmê* ("science"). *Philosophia* also has a narrower sense, however, in which it applies exclusively to sciences providing knowledge of starting-points. "Natural science and secondary philosophy" thus has the task of providing theoretical knowledge of the starting-points of perceptible substances (*Met.* 1037^{a}14–15), whereas the immovable starting-point is "work for the other and prior philosophy to discuss" (*GC* 318^{a}6). Since there are just "three theoretical philosophies, mathematical, natural, and theological" (*Met.* 1026^{a}18–19), theological philosophy must be primary, mathematical philosophy tertiary (although it is not ever referred to as such). Primary philosophy is the science of being qua being (*Met*. 1026^{b}29–32). Besides these theoretical philosophies, Aristotle occasionally mentions practical ones, such as "the philosophy of human affairs" (*NE* 1181^{b}15). It is among these that his own ethical writings belong (*Pol.* 1282^{b}19–20).

Phlegm (*phlegma*): "A residue from the useful nourishment" (*GA* 725^{a}16).

Phleps, *phlebion*: **Blood Vessel**

Phôlein: **Hiding, Going into**

Pholidôtos: **Hard-scaled**

Phônê: **Voice**

Phora: **Spatial Movement**

Phortikos: **Unrefined**

Phrase (*phasis*): (1) A *phasis*, like an affirmation, can be the object or content of a mental or speech act. In this sense it is a (possibly one-word) phrase that, like a name or verb (*Int*. 17^{a}17), is significant by itself (16^{b}26–28). (2) In a related sense a *phasis* is the mental or speech act itself of phrasing or putting into words, and may be the giving of an account or definition of an essence or incomposite substance: "As regards the incomposite things . . . truth or falsity consists in this—to touch and to phrase are true (for an affirmation and a phrase are not the same), but to be ignorant is not to touch. For it is not possible to be mistaken about the what-it-is, except coincidentally; and the same holds with regard to incomposite substances, for it is not possible to be in error about them; and they are all active, not potential, for otherwise they would have come to be and passed away" (*Met*. 1051^{b}17–29). The idea is this. When we actively understand an essence or an incomposite substance, we do not do so by predicating something of something, because an essence or substance of the relevant sort is a form (an actuality or activity), not a form said or predicated of matter (1043^{b}29–32). What happens instead is that as a result of being grasped by the understanding the essence or substance is phrased (put into words) or defined. For it is the essence or substance itself and not

a representation of it that the understanding grasps: "in the case of those things that have no matter, what understands and what is understood are the same; for theoretical scientific knowledge and what is known in that way are the same" (*DA* 430^{a}3–6). That is what makes touching the appropriate analog. For while we might think that we see not material objects, but their colors and shapes, we do not think parallel thoughts about touching. See **Truth**

Phusiologos, phusikos: **Natural Philosopher, Natural Scientist**

Phusis: **Nature**

Physical Training (*gumnastikê*): *Gumnastikê*, when provided by a trainer (*gumnastês*, *gumnastikos*), aims to produce a "good physical condition" (*NE* 1138^{a}31; also *EE* 1218^{a}35); when provided by a coach (*paidotribês*), it includes more focused training aimed to inculcate specific physical skills, including athletic and military ones (*Pol*. 1338^{b}6–8).

Pimelê: **Fat**

Pinnae (*pinnai*): The *Pinna nobilis* or fan mussel is a species of large Mediterranean clam.

Pipe (*aulos*): (1) A reed instrument (*HA* 565^{a}24), rather like a modern oboe. "Flute" is the standard but misleading translation. *HA* 581^{b}10–11 refers to "maiden's pipes" and "boy's pipes," which may have been pipes with different pitches. *Pol.* 1342^{b}1–6 discusses a pipe's effects. (2) A duct in the body (*GC* 322^{a}29, *HA* 489^{b}3, 513^{b}6). (3) The blowhole pipe in a whale or dolphin (*HA* 489^{b}3).

Pistis: **Persuasion, Means of**

Pity (*eleos*): "A sort of pain at an apparently destructive or painful bad thing happening to someone who does not deserve it, and one that a person might expect himself too or one of his own to suffer, and this when it appears close at hand" (*Rh*. 1385^{b}13–16). It is made significant use of at *Po*. 1449^{b}27, 1452^{a}3, 1452^{a}38. See **Purgation**

Place (*topos*): "The limit of the encompassing body at which it is in contact with what is encompassed. (By 'what is encompassed' I mean a body that can be moved by way of spatial movement)" (*Ph*. 212^{a}5–6a).

Place, Proper (*oikeios topos*)
In the case of sublunary animals, up and down, front and back, right and left are not just spatially or relationally distinguished but functionally and absolutely so: "the up and the down are distinguished by [their] work, and not only with respect to their position relative to the earth and the heaven. For where the distribution of nourishment and growth is from in each, this is the up; and where it, ultimately, comes to an end, this is the down. For the one is a sort of starting-point, the other a sort of end-point; and the up is a starting-point" (*IA* 705^{a}32–^{b}2). Similarly, the front is a starting-point, because it is where the perceptual organs are located (705^{b}10–13). Even in earthworms, where right and left are more difficult to distinguish perceptually, the functional difference between them still exists: "the starting-point from which movement derives is the same for all of them, and has its position in the same place in accord with nature. The right is indeed the starting-point from which movement derives" (706^{a}10–13): human beings put their left foot forward, unless they accidentally do the opposite, since "they move not with the part they put forward but with the one with which they step off" (706^{a}8–9).

In the case of the universe, the same applies not just to right and left but to all six functionally defined directions (*Cael.* 285^{a}31–^{b}8). It is these functionally defined directions that determine unconditional or absolute locations or places in the universe: "every perceptible body is in a place, and the forms and differences of place are up and down, before and behind, and right and left. And these are not merely relative to us or to our position, but are also distinguished within the whole universe itself" (*Ph.* 205^{b}31–34). The place that is unconditionally up, as opposed to being up relative to something else, is thus at the periphery of the universe; the one that is unconditionally down is at its center (*Cael.* 308^{a}17–29).

It is absolute places, in turn, that figure in the essential definitions of the five elements, making them the closest analog of form that these elements possess: "this is what is being inquired about: why it is that the light and the heavy do move to their own place. And the cause is that it is natural for them to be somewhere, and this is the being for the light and the heavy, the one being determined by up and the other by down" (*Ph.* 255^{b}13–17). Earth is thus what is unconditionally heavy, since unless it is opposed, it naturally moves toward the place at the center. The center of the universe, therefore, is its proper place—the place where it would be unless something else prevented it.

Pleasure (*hêdonê*)
(1) "Pleasure is a sort of movement of the soul, an intensive and perceptible settling down into its original natural state, and pain the contrary" (*Rh.* 1369^{b}33–35). (2) Pleasures are "activities and an end" (*NE* 1153^{a}10). (3) "Pleasure is what completes the activity . . . not as the state does by being present in something but as a sort of supervenient end, like the bloom on those in their prime" (1174^{b}23–33). (1) is the sort of generally acceptable view of pleasure suitable for rhetoricians to learn; it need not be taken as expressing Aristotle's own view, which is expressed in (2) and (3). These, however, appear to conflict: in (2) pleasure is identified with the activity itself, not—as in (3)—with the supervenient end that completes the activity.

Aristotle's primary god, however, who is a simple and entirely immovable being (*Met*. 1072^{a}21–^{b}1), whose one activity, to which he is identical (1072^{b}27), is "a pleasure" (1072^{b}16). In his case, therefore, that pleasure must just be the activity that he is. But what is true of him is that his activity is always and necessarily "the activity of the subject that is in good condition in relation to the most excellent of its objects" (*NE* 1174^{b}22–23). For "active understanding is intrinsically of what is intrinsically best, and the sort that is to the highest degree best is of what is to the highest degree best" (*Met*. 1072^{b}18–19), and "the god is a living being who is eternal and best" (1072^{b}28). This is obviously not true of human beings. For even when their state is in good condition and in relation to the most excellent of its objects, its activity may be disrupted or impeded, and so is not guaranteed even then to be pleasure. This disruption or impedance, moreover, may come from within the human soul itself (*NE* 1154^{b}20–31, 1175^{a}3–10).

It seems reasonable to suppose that Aristotle introduces supervenient ends to register this difference between the god's pleasure and a human being's. (Notice the parallel conclusion about the happy life at *NE* 1101^{a}20–21.) A man in his prime is the analog of the state in the best condition. His bloom, which is the analog of pleasure, is present when the man is actively and unimpededly bloom*ing*. (2) identifies pleasure with unimpeded activity; (3) explains the precise nature of the non-impedance.

Pleonektos: **Get More, One Who Tries to**

Plêthos: **Majority**

Pneuma: **Breath**

Poetry, Craft of (*poiêtikê*): The craft of producing poetry, including epic poetry, tragedy, comedy, and so on (*Po*. 1447^{a}8). The *Poetics* is a methodical inquiry into this craft.

Poiein: **Produce**

Poiêtikê: **Poetry, Craft of**

Point (*stigmê*): (1) "What is indivisible in quantity, when it is indivisible in all dimensions and lacks position, is said to be a unit, and when it is indivisible in all dimensions and has position, a point" (*Met*. 1016^{b}24–26). (2) "Points are cuts or divisions of lines" (1060^{b}13–15).

Poion: **Quality, Sort of Thing**

Polis: **City**

Politeia: **Constitution, Polity**

Politeuma: **Governing Body of a Constitution**

Political Animal (*politikon zô[i]on*): See **Human Being**

Political Club (*hetaireia*): Thucydides 8.54.4 mentions "sworn associations which already existed in Athens for mutual support in lawsuits and in elections." To a

certain extent these are the equivalent of the *hetaireiai* mentioned, e.g., at *Pol.* 1305^{b}32. But *Ath.* 34.3 mentions "the notables in the *hetaireiai* . . . who wanted an oligarchy," contrasting them with others "who did not belong to any *hetaireia*, but were in other respects reputable citizens" and who "aimed at restoring the ancestral constitution."

Politician (*politikos*): A *politikos* is someone who rules a city, or holds political office in it, using, in the best case, his knowledge of political science, and, in the less than best case, some—perhaps very distant—approximation to it. See F90 54.10–56.10.

Politics (*politikê*): (1) *Politikê* is the practical science used in ruling a city (*NE* 1099^{b}29–32, 1102^{a}18–25, 1103^{b}3–6, 1152^{b}1–3, 1180^{b}23–1181^{b}23). For this reason, it is the most architectonic and most controlling science (1094^{a}26–^{b}7). (2) It comprises legislative science, deliberative science, and judicial science (1141^{b}32–33), but also a part concerned with particular cases, and the decrees suited to them (1141^{b}26–28). (3) It is the same state of the soul as practical wisdom, but differs in being: practical wisdom is more directed toward the good of the individual, politics more toward the good of the city as a whole (1141^{b}24–26).

Polity (*politeia*): Aristotle gives a number of different accounts of what a polity is: (1) a constitution ruled by the majority for the common advantage (*Pol.* 1279^{a}37–9); (2) a mixed constitution (1293^{b}33–34, 1294^{a}22–23); (3) a constitution that depends on the middle class (1295^{b}34–1296^{a}9); (4) a constitution that depends on the hoplite or warlike class (1265^{b}26–28, 1288^{a}12–15, 1297^{b}1–2). The nature of the mixture mentioned in (2) is also variously characterized: (2.1) a mixture of democracy and oligarchy (1293^{b}34, 1307^{a}10–12); (2.2) a mixture of the rich and the poor, wealth and freedom (1294^{a}16–17); (2.3) a mixture of elements drawn from democratic and oligarchic constitutions (4.9). Aristotle never explicitly identifies a polity with the middle constitution described in 4.11 (except perhaps at 1297^{a}3–40), but for the following reasons it seems that the latter just is a (well-mixed) polity: (1) There are just six types of constitutions: kingship, aristocracy, polity, democracy, oligarchy, and tyranny (1289^{a}26–30). Hence the middle constitution must be one of these. What could it be besides a polity? (2) A well-mixed polity is in the middle between an oligarchy and a democracy (1294^{b}14–18), so is the middle constitution (1296^{a}22–40). Since there cannot be two middles between two extremes, the middle constitution must be a well-mixed polity.

Polutokos: **Many-offspring-bearing**

Popular Leader (*dêmagôgos*): Occasionally, *dêmagôgos* is a neutral term used to describe an influential democratic leader, such as Pericles (*Pol.* 1274^{a}10), but more often it has a negative connotation, referring to those who act as popular leaders of the people and undermine the rule of law (1292^{a}4–37) in order to gain power.

Poreia: **Progression**

Poros: **Duct**

Positive (*katêgorikos*): When applied to a premise or a deduction the adjective *katêgorikos* seems to be an antonym of **Privative**.

Possible (*endechesthai*): (1) "Things are said to be possible in many ways—for we say that what is necessary is possible, and also that what is not necessary is, and also that what is potential (*dunaton*) is" (*APr*. 25^{a}37–39). (2) "I use the expressions 'to be possible' and 'what is possible (*endechomenon*)' of whatever is not necessary but, when it is supposed to be the case, nothing will be impossible (*adunaton*) because of this (for we say that what is necessary is possible homonymously)" (32^{a}18–21). (3) "It is possible for something to be capable of being and yet not be, or capable of not being and yet be, and similarly for the other categories—to be capable of walking and yet not walk, and to be capable of not walking and yet walk. A given thing is capable if nothing impossible (*adunaton*) follows from the assumption that the activity it is said to have the capacity for belongs to it. I mean, for example, if a thing is capable of sitting and it is possible for it to sit, if sitting should belong to it, there will be nothing impossible occurring" (*Met*. 1047^{a}20–28). In general, *endechestai* and *dunatos* do not differ significantly in meaning. See **Capacity**; **Necessary**

Postulate (*aitêma*): "A postulate is contrary to the learner's belief, or is something which, though demonstrable, one assumes and uses without demonstrating" (*APo*. 76^{b}32–34). The term is often used more loosely.

Potential, Potentiality: See **Activity**; **Capacity**

Pous: **Foot**

Power: See **Capacity**

Practical (*praktikos*): When *praktikos* marks a contrast with *theôrêtikos* it is "practical" while *theôrêtikos* is "contemplative," when applied, as to a type of life or activity (*EE* 1249^{b}14), but "theoretical" when applied to a type of science or thought (1216^{b}11). While in many ways apt, this opposition is also somewhat misleading. For what makes something practical for Aristotle is that it involves *praxis* or action considered as an end choiceworthy because of itself (so sometimes it is "action-involving"), and not—as with "practical"—that it is opposed to what is theoretical, speculative, or ideal. Hence theoretical activities are more practical than those that are widely considered to be most so: "It is not necessary, as some suppose, for a practical life to be in relation to other people, nor are those thoughts alone practical that arise for the sake of the consequences of doing an action; much more practical are the acts of contemplation and thought that are their own ends and are engaged in for their own sake; for doing well in action (*eupraxia*) is the end, and so action of a sort is the end too" (*Pol.* 1325^{b}16–21). If some things are practical because they are useful, effective, or feasible means to some end, then, others are yet more practical because they further an end by constituting it or being identical to it (*EE* 1217^{a}35–40).

Pragmateia: **Study, System**

Praiseworthy (*epainetos*): We praise an ethical agent or a runner not just for being of a certain quality (virtuous, in good athletic condition) but for doing something as a result of it that we value as good or excellent, such as winning a race for our city or country or doing a courageous action in its defense (*NE* 1101^{b}15–16). See **Noble, for the Sake of the**

Prakton: **Action, Doable in**

Praxis: **Action**

Pray, Prayer (*euchesthai*, *euchê*): Though his gods lead strictly contemplative lives (*NE* 1178^{b}7–22, *Met*. 1074^{b}34–35) and so are unaware of our existence, Aristotle sometimes speaks of prayer in an intercessory way, and in some texts tells us how to pray and what to pray for (*NE* 1118^{a}32, 1129^{b}4, *Pol*. 1295^{b}33, 1325^{b}36). Since much can happen in Aristotle's world that is not necessitated by anything, but is a matter of luck or chance, or is up to us and what we freely do, such prayers might amount to little more than wishes focused on such things, which are prayerful simply in that they acknowledge the reality of the divine order of things where necessity prevails. Perhaps their intercessory aura is no more than the un-exorcised ghost of Greek popular religion with its pantheon of gods, ever ready to help or harm. In the absence of Aristotle's lost book *On Prayer* (mentioned in F80), it is difficult to be entirely sure.

Precisely (*hoper*): To say that A is *hoper* B is to say that B is precisely what A is (in other words, that A is precisely B). Sometimes B is the kind of A (*Top.* 116^{a}23–28, 122^{b}18–20, *APr*. 49^{b}6–8), sometimes its essence (*Top*. 120^{b}21–26, *Met*. 1007^{a}33).

Predicate (*katêgorein*): Predicating is sometimes restricted to unconditional or non-coincidental cases, where the subject of predication is a substance. To say that the human is walking is thus to predicate walking of a human, while to say that the white thing is walking is not to predicate walking of the white thing, but of the human, who is coincidentally white (*APo*. 83^{a}1–35). Usually, but not always (*Met*. 1049^{a}34–36), what is predicated is a universal. When B is predicated of A, A is said to be B, and B belongs to A. See **Said to Be**

Predication, Figures of (*schêmata tês katêgorias*): The figures of predication are the categories.

Pregnancy (*kuêsis*): *Kuêsis* occurs in a female when she has a *kuêma* in her uterus (or its analog). As a result, it applies in cases in which we would not naturally speak of pregnancy—e.g., when female fishes have unfertilized roe.

Premise, Proposition (*protasis*): A *protasis* is something put forward. When it is put forward in a deduction or argument, it is a premise, otherwise a proposition. When contrasted with a (dialectical) problem, it is a question (*Top*. 101^{b}28–36).

Primary Things (*prôta*): The primary things in the strictest sense are the primary substances (*Met.* 1059^{a}33–34), and of these, the most primary is the one that is simple and an activity (1072^{a}31–32), and so has no matter (or no reference to matter) in its essence (1071^{b}19–21, 1074^{a}35–36). Unlike the essences of matter-form compounds, therefore, which have a structure like that of the compounds themselves (1037^{a}9–10), its essence is not a compound of this form in this matter, both taken universally (1035^{b}29–30). Equivalently, in its essence the activation or form is not predicated or said of anything else, in the way that it is predicated or said of the matter in matter-form compounds (1043^{a}5–6), and so in their similarly structured essences. That is why it is said or expressed "not by way of saying one thing of another" (1030^{a}10–11; also 1051^{b}17–1052^{a}4). It is for this reason too that the primary things are what the most exact science—theoretical wisdom—is concerned with. For as the starting-points of unconditional demonstrations (1015^{b}8–9), they are the primary starting-points and causes (982^{b}1–4)—the "eternal and the primary things" (*GC* 335^{a}29). So "if they were not, nothing would be" (*Met.* 1050^{b}19).

Prime (*akmê*): The prime time for a man's service in the military is that of his body, which is somewhere between the ages of thirty and thirty-five, while the prime time for that of his soul or his capacity for thought is forty-nine or fifty (*Pol.* 1335^{b}34–36, *Rh.* 1390^{b}9–11), and it is not until then that he has the experience required for practical wisdom (*Pol.* 1329^{a}15). A woman is in her (physical) prime between the ages of eighteen and fifty-four or so (1335^{a}28–29, ^{b}26–38).

Prior (*proteron*): The various sorts of priority are distinguished at *Cat.* 14^{a}26–^{b}8. In *Met.* 5.11, Aristotle mentions priority in the sense of being closer to a starting-point, priority in knowledge, in nature and substance. The Greek words for prior, posterior, and simultaneous all have a (secondary) non-temporal, as well as a (primary) temporal sense. The English words "prior" and "posterior" parallel their Greek counterparts in this respect; "simultaneous" does not, but must sometimes (*Cat.* 14^{b}26) be read as if it did. See **Separable**

Private (*idion*): In contrast to what is public or common (*koinon*) (*Pol.* 1263^{a}26, 1266^{a}31, 1273^{a}35, 1279^{a}30, 1284^{b}5, ^{b}23, 1300^{b}22).

Privation (*sterêsis*)

To say what cold is we refer to the positive notion heat, of which cold is the privation, so that cold is what lacks heat: "The positive is prior to the privation" (*Cael.* 286^{a}25–26). That is why "the same account makes clear both the positive thing and its privation, except not in the same way—that is, in a way it is of both, but in a way it is rather of the positive thing" (*Met.* 1046^{b}8–9). Privation may be a matter of degree, so that what is colder lacks more of the hot than what is less cold.

While a privation can be of one of a pair of contraries, it can also be the lack of something—such as substance—that strictly speaking has no contrary (*Cat.* 3^{b}24–27): "One of a pair of contraries is a privation no less [than a contrary], or a privation of

substance, and a privation is the denial [of something] to some definite kind" (*Met*. 1011^{b}18–20). Privation of substance (or form) is evidenced in cases of existence changes, where a substance either comes to be or passes away.

When we affirm that F does not belong to A, we affirm "A is not F," but when we affirm that "A is deprived of or lacks F," or "A is not-F," an underlying subject is involved. This is the "some kind" referred to at, e.g., *Met*. 1004^{a}13. For when A is not-F, it must belong to a kind that can be F or can be not-F. When we affirm "A is deprived of or lacks F," there is thus an underlying kind, G, to which A must belong. Since belonging to G is what makes it possible for A to have F or to be deprived of or lack F, having F or lacking F must both entail being G, so that F must be a difference of G. This is not true when we affirm "A is not F." See *Met*. 5.22, 1055^{b}11–29.

Privative (*sterêtikos*): When applied to a premise or a deduction the adjectives *sterêtikos* and *apophatikos* ("negative") seem to mean more or less the same.

Probative (*deiktikos*): The term *deiktikos* is used to distinguish direct deductions from indirect ones, which lead to the impossible (*APr.* 45^{b}9) and also to distinguish demonstrations that do not involve a privation from those that are *sterêtikos* because they do (*APo*. 86^{a}32, ^{b}31, 36, 87^{a}5).

Problem (*problêma*): "A dialectical problem is a speculation, directed either to choice and avoidance or to truth and knowledge (either by itself or when working together with something else of this sort), about which people believe nothing either way, or ordinary people believe in a contrary way to the wise, or the wise to ordinary people, or each of them to themselves" (*Top*. 104^{b}1–5). The term is also used in a similar way outside dialectic (*Ph*. 213^{b}3, *GA* 724^{a}7, 746^{b}16, *Pol*. 1268^{b}26, 1284^{b}3, *EE* 1244^{a}3, *Rh*. 1414^{a}35, *Po*. 1460^{b}6). In the *APr*. problems are the four forms of premise or conclusion: universal affirmative and negative, particular affirmative and negative.

Produce, Production (*poiein*, *poiêsis*): (1) In the broadest sense *poiein* is a matter of doing something to something, acting on it or affecting it in some way, so that the latter *paschein* ("suffers," "undergoes," or "is affected") correlatively. (2) In a narrower sense production is contrasted with action, as not being intrinsically an end, but something chosen or desired for the sake of some further end (*NE* 1139^{b}1–4). See **Craft**

Progression (*poreia*): The sort of movement characteristic of animals. The corresponding adjective *poreutikos* is "walker" or "move by walking," when it applies to walkers in contrast to flyers or swimmers, and as "progress" or "move by progression" otherwise.

Prohairesis: **Deliberate Choice**

Proof (*tekmêrion*): "A necessary sign is a proof. . . . I call 'necessary' those from which a deduction comes about. That is why indeed such a sign is a proof; for when people think that it is not possible to refute what has been stated, they think they are putting forward a proof, on the supposition that the matter has been proved and come to an end" (*Rh*. 1357^{b}5–9).

Proper (*oikeios*): *Oikeios* derives from *oikos* ("household"), so that what is *oikeios* to something belongs to it or is proper to it.

Property Assessment (*timêma*): A measure of wealth or property for the purposes of taxation or determining public service, often used to determine citizenship or eligibility for political office.

Pros ti: **Relative**

Prosêkon: **Fitting**

Prostatês: **Champion, Sponsor**

Prôta: **Primary Things**

Protasis: **Premise**

Proteron: **Prior**

Prove (*deiknunai*): To prove something is sometimes to demonstrate it (*APo*. 71^{b}23, 72^{a}39), but proving a starting-point is not demonstrating it. The nominalized form of the verb is "proof" (*APo*. 84^{b}34, 88^{b}2). See **Dialectic**

Proxenos: **Agent**

Psêphisma: **Decree**

Psophos: **Sound**

Psuchê: **Soul**

Psuxis: **Cold**

Ptêtikos: **Flyer**

Public Service (*leitourgia*): Any public service paid for out of private funds, such as funding a chorus for a play, equipping a trireme for the navy, or providing a feast for the city (*NE* 1122^{b}22–23). Sometimes, *leitourgein* comes close in meaning to our notion of charitable giving (1163^{a}29, 1167^{b}12).

Puetia: **Rennet**

Pungent: *Drimus*

Puon: **Pus**

Purgation (*katharsis*)
When something is purged of impurities, it is rendered pure (*katharos*). In biological contexts the term seems to be used exclusively (though *GA* 747^{a}19 may be an exception) in connection with menstruation (*HA* 573^{a}2, ^{b}29, 573^{a}8, 23, *GA* 727^{a}14, ^{b}20), which purges a female (or her menses) of impurities. It is especially, but not exclusively, important in Aristotle's account of tragedy, which is said to accomplish "through pity

and fear the purgation of such feelings" (*Po*. 1449^{b}27–28). A perspicuous account of it is advertised at *Pol*. 1341^{b}38–40, but is not found in the extant works. Nonetheless, the outlines of an intelligible account can be reconstructed with at least moderate confidence, on the basis of 1342^{a}1–16.

Those who are prone to pity or fear or to feelings generally "all get, together with pleasure, a certain purgation and feel their burdens lightened" (*Pol*. 1342^{a}14–15) by listening to "sacred melodies (when they make use of the ones that induce a frenzy in their souls)" (1342^{a}9–10). For the movements in purging music produce correlative movements in the appropriate sort of animate body, which can, when the movements are excellent, produce through repetition and habituation a corresponding virtuous—and so mean—state in the soul (1340^{a}12–28). If we think of the souls of listeners as initially "distorted from the state that is in accord with nature" (1342^{a}22–23), as those of people who are prone to pity and fear are bound to be, we can think of the—perhaps temporary—purgation they experience as stemming from the purging, or correction, of those distortions (*NE* 1109^{b}6–7).

Tragedy, since it involves rhythm, harmony, and melody (*Po*. 1449^{b}29–31), can surely have these very same sorts of effects. But though the whole complex imitation that is the tragedy itself, comprising all its various elements, is "the imitation of a serious and complete action that has magnitude" (1449^{b}24–25), it is the plot that primarily imitates that action and that primarily arouses pity and fear (1450^{b}18–19, 1453^{b}1–7). It seems, then, that it must also be primarily the plot that effects the purgation of these feelings. So the account of music's purging power does not directly carry over to tragedy.

But just as certain movements in the appropriate sort of animate body are correlated with, or realize, certain feelings, so words that evoke those feelings in us are correlated with those same movements, just as images are (*Pol*. 1340^{a}25–28). By operating in the right way, then, and imitating or representing a good person moving from good luck to bad luck, not because of his character but because of "some sort of error" (*Po*. 1453^{a}10), it can (even if only temporarily) purge the distortions, restoring the movements associated with pity and fear to their natural or mean condition (or one closer to it), thereby purging the associated feelings. But this sort of purgation, this rectification of distortions, also has significant cognitive effects. For feelings that are in a mean (or closer to a mean), unlike those that are not, are better discerners of the things—such as danger—that evoke the feelings. That is why, when we have courage, we measure the danger of something correctly, seeing it for what it is, and feeling the correspondingly correct amount of fear toward it, "for the courageous person feels and acts as things merit and in the way reason prescribes" (*NE* 1115^{b}19–20). The same is true mutatis mutandis of pity, where sympathetic consideration rather than courage is involved (1111^{a}1–2). (On the purgation of feelings in comedy, see F111.)

Pus (*puon*): "Blood that putrefies in the body" (*HA* 521^{a}20).

Putrefaction (*sêpsis*): (1) "Putrefaction is the passing away of the proper and natural heat within a given wet thing caused by an alien heat, that is, the heat from its environment"

(*Mete*. 379^{a}16–18). (2) "Putrefaction, that is, the putrefied thing, is a residue of concoction" (*GA* 762^{a}14–15). (3) "Putrescence (*saprotês*) is the end of all these things, that is, of the ones composed by nature, unless something passes away by force; for it is indeed possible to burn flesh, bone, and whatever, but the end of their passing away in accord with nature is putrefaction" (*Mete*. 379^{a}5–8).

Puzzle (*aporia*): (1) A dialectical puzzle about "whether it is so or not so" arises "because there are persuasive arguments on both sides" (*Top*. 104^{b}13–14). (2) A puzzle more generally may simply be a question which as yet has no answer (*HA* 616^{a}30–32). See **Dialectic**

Quadrature by Means of Lunes or Segments: The argument of the mathematician Hippocrates of Chios (fl. c. 450–430 BC) for squaring the circle by means of segments (*Ph*. 185^{a}16) or lunes (*SE* 171^{b}15), which are the figures bounded by two arcs of a circle, is a geometrical fallacy (*SE* 172^{a}3–7).

Quality (*poion*): Defined in *Cat*. 8, *Met*. 5.14. See **Sort of Thing**

Quantity (*poson*): Defined in *Cat*. 6, *Met*. 5.13.

Rare (*manos*): See **Condensation and Rarefaction**

Ratio: See *Logos*

Rational Calculation (*logismos*): See **Deliberation**

Reason: See *Logos*

Reason, Correct (*orthos logos*): The importance of correct reason in ethics is introduced at *NE* 1103^{b}31–34 as something agreed to, and much used subsequently (1114^{b}29, 1119^{a}20, 1138^{a}10). *NE* 6.1 recognizes the need to provide a perspicuous account of it (1138^{b}26) that will determine what it and its defining mark are (1138^{b}34), but though much is said relevant to this in *NE* 6, no such account is explicitly provided. However, *EE* 1249^{a}23–^{b}27 does provide one.

Reasonable (*eulogos*): If X is *eulogos* it is favored by evidence or considerations of various sorts (*DA* 429^{a}25, *GA* 763^{a}4, *Met*. 1074^{a}16, *NE* 1097^{a}8), such as things that appear to be so, things that are said, or acceptable beliefs, so that it is *eikos* ("it makes perfect sense") that X should hold (*NE* 1099^{b}32, 1122^{a}13). But X is typically not something scientifically known or demonstrable, and it may turn out, when more evidence is available, to be false (*Cael*. 2.12, *Met*. 1073^{b}13–17).

Recipient, Primary (*prôton dektikon*): The recipient of, e.g., pale is what the affection paleness belongs to (*Ph*. 186^{a}29), or what "pale" is predicated of. Since "something's being pale will be a composition of surface and paleness" (*Met*. 1045^{b}15–16), surface

figures in the definition of its essence, and so is the primary recipient of paleness. Surfaces, in turn, are the surfaces of substances, so that Socrates is also a recipient of paleness if his surface is a primary recipient of it. Generally, when A is receptive of B, A can take on B.

Reciprocal Replacement (*antiperistasis*): "When . . . the fire is expelled [from a body], . . . propulsion is exerted upon the surrounding air, which in turn compresses the still mobile liquid volume into the places previously occupied by the fire and mixes with it itself" (Plato, *Timaeus* 59a). Aristotle makes use of the notion at *APo*. 98^{a}25–29, *Ph*. 215^{a}15, 267^{a}18, *Mete*. 348^{b}2, 361^{a}1, *Somn*. 457^{b}2, 458^{a}27.

Refutation (*elegchos*): (1) "A refutation is the deduction of a contradiction" (*APr*. 66^{b}11). (2) "A refutation is a deduction together with the contradiction of the conclusion" (*SE* 165^{a}2–3).

Refute, Resolve (*luein*): To *luein* an argument is to untie or resolve (also, *luein*) the knot or puzzle (*aporia*) that it produces when it conflicts with another argument or consideration (*Met*. 995^{a}29). Sometimes it is equivalent in meaning to *elegchein* (also "refute"): "It is possible to refute (*luein*) [an enthymeme] either by stating a counter deduction or by bringing an objection" (*Rh*. 1402^{a}31). But sometimes it differs from it by involving a diagnosis of what is wrong with the target argument: "The person, then, who does away with what the falsehood depends on has entirely resolved the argument, and it is the person who knows that the argument depends on it who knows the resolution" (*Top*. 160^{b}33–35).

Relative (*pros ti*): Neither a relative term, designating a relation, nor a person or thing that a relative term applies to, but rather a person or thing as designated by some relative term. See *Cat*. 6^{a}36–^{b}2, 8^{a}3–34, *Ph*. 200^{b}28–32, *Met*. 1020^{b}26–32, 1056^{b}34–1057^{a}1.

Rennet (*puetia*): "Milk that contains the fire that comes from the heat of the animal when the milk is being concocted [in the stomach]" (*HA* 522^{b}6–8).

Residue (*perittôma*): "A leftover of the nourishment" (*GA* 724^{b}26–27).

Resilience (*karteria*): Resilience is a mean state between luxuriousness and toughness (*EE* 1221^{a}9). It goes along with being hard (*sklêros*) and so is the contrary of being soft (1229^{b}2). At *Cael*. 287^{b}33–34 human conviction is contrasted with a more resilient sort.

Resolution (*lusis*): See **Refute**

Reversal (*peripeteia*): Defined at *Po*. 1452^{a}22–24.

Rhetoric (*rhêtorikê*): A *rhêtôr* is someone who knows the relevant craft, knows how to use it, and puts it to use. Insofar as he does so by writing speeches to be read, or for others to deliver, he is a "rhetorician," or, in the standard translation, an "orator." But the one who actually delivers the speech, considered as such, is a "speaker." To a first

approximation, therefore, rhetoric is the craft in question and a speech the product. More precisely, rhetoric is the counterpart of dialectic (*Rh*. 1354^{a}1), the methodical inquiry concerned with the means of persuasion (1355^{a}4). See **Persuasion, Means of**

Rheum (*lêmê*): Rheum is putrefied tears (*Mete*. 379^{b}31–32), so a healthy eye does not produce rheum (*HA* 633^{b}20–21) and *lêmê* is an "eyesore" (*Rh*. 1411^{a}15).

Rhopê: **Weight, Balance-**

Rolling (*kulisis*), **Rotation** (*dinêsis*): Rotation occurs when a sphere turns around its own axis in the same place, rolling when it at the same time changes place.

Roughness and Smoothness (*trachutês kai leiotês*): Something is smooth "because its parts lie somehow along a straight line, and rough because some parts stick out and others recede" (*Cat*. 10^{a}22–24).

Rule (*archê*): The notion of exercising rule (*archein*) and the correlative notions of being a ruler (*archôn*) or holding ruling office (*archê*) is explained in the following brief passage: "That in accord with whose deliberate choice what is moved is moved and what is changed is changed—for example, the rulers in cities, dynasties, and kingships are said to be *archai*, as are crafts, especially architectonic ones" (*Met*. 1013^{a}10–14).

Said to Be (*legetai*): (1) When A is said to be B (or B is predicated of A, or B belongs to A), A and B are typically not linguistic items, but particular things or universals, so B is not set in quotation marks. (2) When A is said to be B and the grounds on which it is said to be B differ, Aristotle says that A is said to be B "in many ways (*pollachôs*)." These include the following: there is a respect in which A and B are similar (*APo*. 99^{a}11–12); A is said to be B by analogy; and A is said to be B "with reference to one thing (*pros hen*) and one nature—that is, not homonymously" (*Met*. 1003^{a}33–34). (3) When A is said to be B with reference to one thing, there is no single thing X present in both A and B that is is the ontological correlate of B, as there is when A is said to be B by analogy. But there is something else C, to which A and B are related in robustly specifiable ways, and X is present in C. As with A's being B by analogy, X then provides grounds for the scientific knowledge that A is B (*Met*. 1003^{b}11–16). See **Analogy**

Same: See **One**

Saphês: **Perspicuous**

Satyr Play (*saturikê poiêsis*): A mythological burlesque with a chorus of drunken and lascivious followers of Dionysus, performed after a trilogy of tragedies at a dramatic festival.

Say, Things We (*legomena*): The things we say (*legein*) about something, or that seem true of it (*phainomena*), or that are thought or believed about it (*doxa*) are starting-points for a philosophical investigation of it. They need not all turn out to be among the

endoxa or acceptable beliefs that must be left intact, once the puzzles to which they give rise have been gone through.

Saying: *Logos*

Schadôn: **Grub**

Schêma: **Figure**

Scholê: **Leisure**

Science, Productive (*poiêtikê*): See **Craft**

Science, Scientific Knowledge (*epistêmê*)
Knowledge of a science is a state of the soul that enables its possessor to give demonstrative explanations—where a demonstration (*apodeixis*) is a special sort of deduction from scientific starting-points, which are of just three sorts (*APo*. 76^{a}37–^{b}22). Those special to a science are definitions of the real (as opposed to nominal) essences of the beings with which the science deals (90^{b}24, 93^{b}29–94^{a}19). Because these are definitions by kind and difference (96^{a}20–97^{b}39), a single science must deal with a single kind (75^{b}10–11, 84^{b}17–18, 87^{a}38–39). Other starting-points (so-called axioms) are common to all or many sciences (72^{a}14–24, 88^{a}36–^{b}3). A third sort of starting-point posits the existence of the kind with which the science deals, but this may often be left implicit if the existence of the kind is clear (76^{b}17–18). The source of these starting-points, in turn, is perception and experience, which lead by induction, to a grasp of them by understanding (100^{a}3–9).

To constitute a demonstration a deduction must be a valid syllogism in the mood Barbara, whose premises meet a number of conditions. First, they must be immediate or indemonstrable, and so must be reached through induction. Second, our confidence in them must be unsurpassed (*APo*. 72^{a}37–^{b}4). Finally, they must be necessary (and so, of course, true) in a special sense: the predicates in them must belong to the subjects in every case, intrinsically, and universally (73^{a}24–27).

In every case: A predicate A belongs to every subject B if and only if there is no B to which it fails to belong and no time at which it fails to belong to a B: "for example, if animal holds of every human, then if it is true to say that this is human, it is true to say that this is animal too, and if it is now true to say the one, it is now true to say the other as well" (73^{a}29–31).

Intrinsically: A predicate A belongs intrinsically to a subject B just in case it is related to B in one of four ways: A is in the account or definition of what B is, or of B's substance, or essence (73^{a}34–37); B is a complex subject φB_1, where φ is an intrinsic coincident of B_1—e.g., odd number or male or female animal—and A is in the definition of φB_1's essence; A just is B's essence; A is not a part of B's essence or identical to it but stems causally from it, so that being B is an intrinsic cause of being A (73^{a}34–^{b}24).

Universally: A predicate A belongs to a subject B universally just in case "it belongs to it in every case and intrinsically, that is, insofar as the thing is itself" (73^{b}26–27).

Because intrinsic predicates stem in various ways from essences, the subjects to which they belong must have essences. In other words, they must be intrinsic beings, since—stemming as they do from essences—intrinsic predicates identify or make them clear: "The things said to *be* intrinsically are the very ones signified by the figures of predication" (*Met*. 1017^{a}22–23). These figures of predication are the so-called categories (*Top*. 103^{b}7–25). For each of the intrinsic beings in these ten categories we can state its what-it-is (*Met*. 1030^{a}17–24), even if strictly speaking only substances have definitions and essences (1031^{a}7–24). Specifying these beings is one of the tasks of the *Categories*, where Aristotle explains how beings in categories other than that of substance are ontologically dependent on those in the category of substance.

What all four types of intrinsic beings have in common, what makes them worth the attention of someone inquiring into ultimate starting-points and causes, is that they are the ontological correlates or truth-makers for scientific theorems—the beings responsible for the necessary truth of those theorems. Moreover, they would seem to be the only sorts of being that can play this role, since they constitute an exhaustive catalog of the necessary relations that can hold between a subject A and something B predicated of it: B is part of the essence of A; A is part of the essence of B; B is the essence of A; the essence of A (being A) is an intrinsic cause of (being) B.

All sciences of this sort are either theoretical, practical, or productive (*Met*. 1064^{a}16–18). The three kinds of theoretical sciences are the natural, the mathematical, and the theological (1064^{b}2–3). Politics, which comprises ethics (*NE* 1094^{b}11), is a practical science—one concerned with action (1103^{b}26–31). Rhetoric and poetics, together with all the crafts, are productive sciences.

Epistêmê is "science" or "scientific knowledge," and the cognate verb *epistasthai* "have scientific knowledge of" (or an equivalent), even when they may have a looser and less technical meaning (*Pol*. 1255^{b}30, 1271^{b}5, 1277^{a}25). See **Deduction**

Sciences, Free: "Just as a human being is free, we say, when he is for his own sake and not for someone else, in the same way we say that [theoretical wisdom] is the only free science; for it alone is for its own sake" (*Met*. 982^{b}25–28). At *Pol*. 1337^{b}15, the free sciences are those that are fitting for a free person to learn.

Scientifically Known, Knowable (*epistêton*): As in the case of *aisthêton*, *prakton*, and *chôriston*, and verbals ending in *-ton*, *epistêton* sometimes has the meaning of a perfect passive participle and sometimes expresses possibility.

Sea Snail: *Kochlos*

Secretion (*apokrisis*): The noun *apokrisis* is used to refer exclusively to spermatic (*GA* 727^{a}27) or generative (739^{a}5) residues, or to related things, such as milk (776^{a}27, 776^{b}29, 777^{a}4) and the cognate verb *apokrinein* to their expulsion. Another noun, *ekkrisis* (verb: *ekkrinein*) is used a few times to refer to the expulsion of spermatic residues (751^{a}22, 765^{b}29, 774^{a}5, 775^{b}7) and milk (776^{b}20), but is also used for the expulsion

of waste products (719^{b}32, 720^{a}7, 750^{a}30, ^{b}21) and for the outgrowth of bones, horns, and teeth (728^{b}21).

Seed (*sperma, katamênia*): "A residue that comes to be by a change in the nourishment" (*GA* 736^{b}26–27). This is true both of male—and occasionally female (*PA* 689^{a}12)—semen (*gonê*), and of female menses (*katamênia*), or, more exactly, of the useful residue in each.

Seed, a (*gonos*): *Gonos* refers to fish eggs or spawn (*HA* 543^{a}6), to what becomes the larva of a bee (554^{a}21–23), to fully developed offspring, and to a brood of birds or bees (553^{b}21). Context determines its translation, with "seed" and "offspring" usually preferred.

Selachê: **Selachian**

Selachian (*selachê*): A sort of animal that is "footless, has gills, and is live-bearing" (*HA* 511^{a}5–6). Cartilaginous fish, including sharks.

Self-control, Lack of (*akrasia*): Discussed briefly in *NE* 1.13 and more fully in 7.1–10.

Self-deprecator (*eirôn*): (1) Socrates is the canonical *eirôn*, whose disavowal of expert craft knowledge of virtue is a commonplace in Plato's portrait of him (*Apology* 20d–e, 21b, *Meno* 71b, *Protagoras* 361c, *Republic* 354c). As a result many of his interlocutors—especially hostile ones—charge him with *eirôneia* ("irony" as it is usually translated in this context), thinking that he must have such knowledge if he is able to refute others (*Republic* 337a, *Symposium* 216e). Aristotle, however, takes these disavowals at face value (*SE* 183^{b}7–8, *NE* 1127^{b}25), so that "self-deprecation" is generally a less misleading translation. (2) At, e.g., *Pol.* 1275^{b}27 the associated verb *eirôneuomai* means "in jest."

Self-love (*philautia*): Focally discussed in *NE* 9.8.

Self-sufficient (*autarkês*): Something is *autarkês* if (1) it has no needs, or none that it cannot satisfy itself (*Cael.* 279^{a}21, *Met.* 1091^{b}15–20, *NE* 1112^{b}1, 1125^{a}12, 1160^{b}4, 1169^{b}5), or (2) if it satisfies all of a relevant set of needs of something else: happiness is *autarkês* because, on its own, it "makes a life choiceworthy and lacking in nothing" (*NE* 1097^{b}14–15, 1176^{b}5).

Sêmainein: **Signify**

Sêmeion: **Sign**

Semen (*gonê*): See **Seed**

Seminal Fluid (*thoros*): Milt in male fishes and its equivalent in other animals (*HA* 510^{a}1).

Semnotês: **Dignity**

Separable, Separated (*chôriston*)
As in the case of *aisthêton*, *epistêton*, *prakton*, and verbals ending in *-ton* generally, *chôriston* sometimes has the meaning of a perfect passive participle ("separated") and sometimes express possibility ("separable"). When *chôriston* is applied to substances it is translated as "separable," since this often seems to capture its sense better, especially that of its negative. But just what the separability of substances amounts to is another—and controversial—issue.

(1) Walking and being healthy are characterized as not "capable of being separated," on the grounds that there is some particular substantial underlying subject of which they are predicated (*Met*. 1028^{a}20–31). Often, separability is associated with being such a subject: "If one does not posit substances to be separate, and in the way in which particular things are said to be separate, one will do away with the sort of substance we wish to maintain" (1086^{b}16–19; also 1019^{a}5–6). Similarly, not being separable is associated (*Ph*. 185^{a}31–32) with being predicated of such a subject. Being predicated of a substance—being an affection—seems, then, to be a sufficient condition of not being separable. Moreover, not being separable seems itself to be a sufficient condition of being ontologically dependent (*Cat*. 2^{b}3–6).

(2) Couched in terms of priority, what is attributed to primary substances in (1) is substantial priority, or priority in nature, which Aristotle defines in two ways: (2a) Things are said to be prior "in nature and substance, when it is possible for them to be without other things, but not the others without them" (*Met*. 1019^{a}3–4); (2b) "Those things are prior in substance to others which, when separated, surpass them in being" (1077^{b}2–3). Moreover, in a text apparently expressing an idea similar to (2b), the form of a matter-form compound is said to be "prior to the matter and more of a being" (1029^{a}5–6). Since existence, like identity, does not come in degrees, the use of "surpass" and "more" makes it difficult to understand "being" as having an exclusively existential sense. At the same time, "being" does seem to have some existential import, as it surely does in (2c): "if everyone were healthy, health would exist, but illness would not. Similarly, if everything were white, whiteness would exist, but blackness would not" (*Cat*. 14^{a}7–10). It seems reasonable, therefore, to think that to be is to be a being of some sort, and that to be a being entails existing.

To be a being, however, is to be either a coincidental being (the pale human) or an intrinsic being, something with an essence (the human). To be an intrinsic being, in turn, is to be either an intrinsic coincident, a matter-form compound, or simply a substantial form. As identical to its tightly unified essence (*Met*. 1037^{b}10–27), a substantial form is an intrinsic being of the highest order—a primary substance (1037^{b}3–4). A matter-form compound, by contrast, since it is never identical to its essence (1037^{b}4–7), is an intrinsic being of a lower order (1072^{a}30–32), since it is always a complex thing—a this in this (1030^{b}18)—whose essence is complex in a structurally parallel way (1035^{b}27–30). Similarly, an intrinsically coincidental being, while it follows from

an essence, is still a complex of two intrinsic beings, one a substance with an essence, the other an affection. For X to be more of a being than Y, or to exceed Y in being, we might reasonably conclude, is for it to be closer to a substantial form on this scale. It is, as we might put it, for X to be more intrinsic a being than Y. Degrees of being are degrees of being intrinsic, then, not degrees of existence.

(3) Affections depend for their existence on substance, but not on that of some particular substance: any substance that has them will do. White exists if something is white, but the something does not have to be Bucephalus or Socrates. Hence the parallel claim about substances should not be that a substance can exist without any affections, suggesting that substances are bare particulars, but that substances in general can exist whether or not affections do. Now, on an *ante rem* (or Platonist) theory, affections can exist un-instantiated by (perceptible) particulars, whereas *in re* theory, like Aristotle's, they cannot. That is the message of (2c). Hence the ontological dependence of affections—and the cognate ontological independence of substances—must be formulated differently by these theories. It seems, then, that if *in re* affections were ontologically independent of substances, it could only be because they were instantiated by something else, since they cannot exist un-instantiated by particulars of some sort. This is the way we see Aristotle thinking in the following text: "it is possible for the hot or the straight to be present in every thing, but it is impossible for the whole thing to be either hot or straight or white; for then the affections would be separate" (*Long*. 465^{b}12–14). Whiteness would be separate from substance, notice, not if it existed entirely un-instantiated, but if it were instantiated by a being that was wholly and exclusively white. Such a being is obviously not an Aristotelian substance, but something more like the Platonic Form of whiteness, which does seem to be white and nothing else (Plato, *Phaedo* 78d). Aristotelian substances can exist, then, whether or not their affections exist by being instantiated by something else. Affections, on the other hand, cannot exist unless they are instantiated by Aristotelian substances, since such substances are (in Aristotle's view) the only ultimate subjects of predication. The separability of substance from affections, on this way of looking at it, is entirely of a piece with their inseparability from it.

(4) The verb *chôrizein* derives from *chôra* ("place"), and means "to separate, part, sever, or divide" things by causing them (roughly speaking) to be in disjoint places (*Met*. 998^{a}17–19, 1068^{b}26–27): when Aristotle describes Plato as separating the Forms from perceptible particulars (1078^{b}30–32), the primary connotation is that of putting them in separate places: perceptible particulars are "here," Forms are "over there" (990^{b}34–991^{a}1). For a Form is "a particular, they say, and separable" (1040^{a}8–9) and "place is special to particular things, which is why they are separable by place" (1092^{a}18–19). Moreover, the fundamental objection Aristotle makes to such separable Forms is that they are an incoherent mixture of universals and of the particulars needed for their instantiation and existence: "They at the same time make the Forms universal and contrariwise treat them as separable and as particulars. But that this is not possible is a puzzle that was gone through before" (1086^{a}32–35; 1003^{a}5–17). We might expect,

therefore, as (4) implies, that the separability Aristotle accords to his own substances, but denies to affections, is the same as the separability he denies to Platonic Forms: affections are in substances around here, not in substances (= Forms) that are elsewhere.

(5) Though separability is often characterized in terms of existential independence, in some cases this seems not to be required (*Cat*. 14^{b}11–22). What lies at the bottom of separability, then, seems rather to be a sort of ontological independence that is causal or explanatory in nature. And this is clearly what we find in the following texts: "[vegetative soul] can be separated from the others, but in the case of mortal beings the others cannot be separated from it" (*DA* 413^{a}31–32); "these bodily parts . . . cannot even exist when they are separated" (*Met*. 1035^{b}22–24). For what makes perceptual soul inseparable from nutritive soul, or a finger inseparable from an animal, are the causal relations that make the former dependent on the latter. Again, this makes the separability accorded to substances, but denied to affections, the same as the separability denied to Platonic Forms. For the latter too were intended to play an explanatory role: "the Forms are the causes of the what-it-is of other things, as the one is of the Forms" (988^{a}10–11). "What all the gods love" does not pick out the Form of piety, then, because being loved by the gods is not what makes something pious (Plato, *Euthyphro* 10d–e).

(6) The separability of substance and the inseparability of affections, while obviously essential to the account of both, is a special case of a more general phenomenon. For substance as form is not just separable from affections but from matter as well. But if this is the sort of separability characterized in (1)–(5), it must be asymmetrical, so that form can exist apart from matter but not matter apart from form. In the case of the forms of matter-form compounds, whether their matter is perceptible or intelligible, this is clearly not the case: like snub, but unlike concavity, they cannot exist apart from matter (*Met.* 1025^{b}28–1026^{a}15). But in the case of other forms, those that are like concavity, it is possible (1026^{a}15–16, 1071^{b}20–21). These are the primary intelligible substances, on which all others—including matter-form compounds—causally depend for their existence (1050^{b}19) and order (1060^{a}26–27). Matter, by contrast, cannot exist apart from form of some sort (1089^{b}27–28), since without form it is not intrinsically anything at all (1029^{a}20–21).

(7) In (1) separability is tied to being a particular subject of predication, and so seems to be somehow logical or logico-linguistic in nature. (6), on the other hand, seems to tell a different sort of story, in which separability has more to do with causation and explanation than with logic pure and simple. To bring the two together we need only reflect that Aristotle's logic is primarily a logic of science, and that whenever we have a subject-predicate proposition there is always a question as to why the predicate holds of the subject. The target of scientific explanation, indeed, is always precisely this: Why does predicate P hold of subject S (*Met.* 1041^{a}10–11)? If P holds of S coincidentally, or by luck or chance, science has nothing to say about it (1026^{b}3–5): there is no explanation. But if P is an intrinsic coincident of S, or if P is part of S's essence, or is S's essence, science does have something to say about it. What this implies is that the primary explanatory entities cannot themselves have a subject-predicate structure

(*Met*. 1051^{a}34–^{b}5). They cannot be expressed as one thing said of another—they are not thises-in-thises. Instead, in comparison to things with such a structure, they are simple: forms, not matter-form compounds. The problem is how separable forms, which, like all forms, are universals (1036^{a}28–29), can indeed be primary subjects and this somethings—separable "in the way in which particular things are said to be separate" (1086^{b}17–18). Aristotle's answer is given at 1087^{a}10–25.

Sêpsis: **Putrefaction**

Serum (*ichôr*): "Unconcocted blood; either blood that is not yet concocted or that has become serous" (*HA* 521^{b}2–3; also *PA* 651^{a}17–19). The other part consists of fibers (*ines*), which are "intermediate between sinew and blood vessel" (*HA* 515^{b}27) and are "earth" (*PA* 651^{a}7). See also *Mete*. 384^{a}25–33.

Setting-out (*ekthesis*): (1) The verb *ektithenai* means "expose," "exhibit," or "set-out." In Aristotle's logic *ekthesis* is a way of confirming the truth of a third figure syllogism (P belongs to every S, R belongs to every S, P belongs to some R) by exhibiting or setting-out a particular S (call it N). For N will be R and N will be P (*APr*. 28^{a}10–30). The original home of *ekthesis*, though, is in a geometrical proof, where it refers to the stage at which an arbitrary instance is drawn for the student to see and assigned a name: let ABC be a triangle in which the side AB = the side AC (*APr.* 49^{b}33–50^{a}4). (2) The Platonic method, embodied in *the one over many* argument, of introducing a single Form for each many (*Met*. 1031^{b}21, 1086^{b}10, 1090^{a}17).

Sex Organ (*aidoion*): An *aidoion* can be a penis (*HA* 493^{a}25), a vagina (493^{b}2), or a uterus (*GA* 764^{b}23), and may also be employed for the excretion of residues (719^{b}30–31).

Shameful (*aischron*): See **Noble**

Shape (*morphê*): See **Form**

Sharp and Dull (*oxu kai baru*): "It is the rapid sound that is sharp (as those who do arithmetical harmonics say)" (*Top*. 107^{a}15–16). The sound is rapid because it is produced by rapid vibrations of a tight string, producing a high, sharp, piercing sound. Slower vibrations of a slacker string produce flat, bass, or dull sounds. *To oxu* in the case of sound is high-pitched, and *to baru*, low-pitched, flat, or bass. To better preserve the analogy with touch *baru* is often "dull."

Sheatfish (*glanis*): The catfish family.

Seeing, Sight (*horasis, opsis*): The movement of the eye-jelly "insofar as it is transparent, but not insofar as it is liquid" (*GA* 780^{a}3–4). *Opsis* is generally the perceptual modality of sight, focally discussed in *DA* 2.7 and *Sens*. 2–3, but sometimes seems to be a ray of sight (*GA* 781^{a}3–12).

Sign (*sêmeion*): (1) Aristotle often declares something to be a sign of something. Signs, however, are of two sorts: related as (a) particular to universal or (b) as universal to

particular (*Rh*. 1357^{b}1–2). An example of (a): "if someone were to say that, since Socrates is wise and just, it is a sign that the wise are just" (1357^{b}11–13); an example of (b): "if someone were to say that there is a sign that a person is feverish, for he is breathing rapidly" (1357^{b}18–19). Both of these are refutable (1357^{b}13, 19–20). Yet "truth . . . may exist in all signs" (*APr*. 70^{a}37–38). This truth cannot be necessary truth: signs are not proofs or demonstrations. It must, then, be either contingent truth or the sort of non-continuous or gappy necessary truth found in things that hold for the most part (*APr*. 32^{b}6). But only a universally quantified proposition can hold for the most part, as in the examples Aristotle gives about crabs (*HA* 527^{b}6–7). With signs, by contrast, there are some that are related as particular to universal, as the fact that Socrates is wise and just is a sign that the wise are just. So a sign can be a particular proposition; one that holds for the most part cannot. At the same time, though, it is not just a contingent fact that Socrates is both wise and just, as it might be that he was married to Xanthippe, but something (putatively) more robust than that: a non-continuous or gappy necessity. (2) A *sêmeion* can also be a point (*APo*. 76^{b}5, *Top*. 141^{b}12, *Ph*. 240^{b}3) or a token (*PA* 669^{b}29).

Signify (*sêmainein*): Aristotle uses the verb *sêmainein* and the cognate noun *sêmeion* to express (1) a relation between a linguistic element, such as a noun or name, and the thing it signifies, means, or denotes, but also (2) a relation between two nonlinguistic elements. In general, when A signifies B, A is not enclosed in quotation marks.

Simple: See **Unconditionally**

Skôptein: **Jibe**

Slave (*doulos*)
A slave is an animate piece of property belonging wholly to his master (*Pol*. 1254^{a}12–23)—an instrument or tool for use in matters having to do not with production but with action (1254^{a}7–8). Some people are legal slaves, or slaves simply because they have been enslaved. Others, however, because their souls lack a deliberative part (1260^{a}12), are natural slaves. As a result, they are not self-sufficient (1291^{a}10) and cannot be happy (1280^{a}32–34). For such people slavery is coincidentally advantageous and just (1255^{a}1–3, 1278^{b}32–37). But it is neither just nor advantageous for merely legal slaves to be enslaved, unless perhaps if they have been living as slaves for some time.

There are also various sorts of natural slaves, some of whom seem to have a larger share in virtue (or reason) than others (*Pol*. 1255^{b}27–29, 1260^{a}14–20, 1330^{a}30–31). Similarly, there are also various sorts of free people: an unrefined craftsman is a free man whose soul presumably has a deliberative part, yet he has "a sort of limited slavery" (1260^{a}41–^{b}1), but he is not a free citizen in most constitutions (3.5).

It is presumably in these doctrines, if anywhere, that we should look for an easing of the tensions that exist in Aristotle's account of natural slaves, three of which are particularly evident. First, though it is just and advantageous for natural slaves to be enslaved, all slaves, natural or legal (it seems), should be offered freedom as a reward for

good service (*Pol*. 1330^{a}32–33). Second, though slaves lack a deliberative part, those heads of household who have the resources delegate the position of household manager (a position that seems to require both deliberative ability and foresight) to a steward, who is himself (presumably) a slave (1255^{b}35–37). Third, and related to the second, is the fact that insofar as a slave is a human being, there is even possibly a sort of friendship between master and slave (1255^{b}12–15).

Perhaps the thought underlying these claims is that training can, as in the case of non-human animals, make up for much of what nature fails to provide. For though these animals too lack a deliberative part, they are capable, because they have imagination, of making associative connections between experiences, which can guide their behavior in much the way that explicit deliberative reasons can guide mature human action. A natural slave with an adequately stocked imagination, then, might well, even without autonomous access to deliberative reasons, make an excellent steward, a passable friend, and be ready, at a certain point, to be released from slavery. Moreover, unlike wild animals, but like children, slaves do have reason, in the sense that, like the desiring part of the soul (*NE* 1102^{b}30–1103^{a}3), they can listen to reasons generated by others, and both understand and follow them.

Sleep (*hupnos*): "Sleep is not every incapacity of the perceptual part, but this affection comes about from the exhalation that rises in connection with nourishment. For the product of the exhalation is necessarily pushed up to a certain point, and then it must turn and change its course like the tide in a narrow strait. And the hot material of each of the animals is naturally carried upward. But when it reaches the upper places, it turns back in a mass and is carried downward. . . . When, then, it comes to a stop, it weighs one down and makes one doze off. And when it turns, sinks downward, and pushes away the hot material, then sleep comes about and the animal sleeps" (*Somn*. 456^{b}17–28).

Snub, the (*to simon*): Often used as an example of something whose definition involves a reference to an underlying subject, usually matter of some sort (*Ph*. 186^{b}22, *Met*. 1025^{b}31, 1030^{b}29, 1035^{a}26).

Soft-bodied Animals (*malakia*): "All the ones which, being bloodless, have their fleshy part outside, and their solid part, if any, inside, as in the case of the blooded animals—for example, the cuttlefish kind" (*HA* 523^{b}3–4). The cephalopods.

Soft-scaled (*lepidôtos*): E.g., fishes.

Soft-shelled Animals (*malakostraka*): "All the ones that have the solid part outside and the soft fleshy part inside; the hard part of these is not receptive of impressions but is shatterable" (*HA* 523^{b}6–7). The crustaceans.

Solidify (*pêgnunai*): (1) Solidification is "a sort of drying" (*Mete*. 382^{b}1). It is what water and liquids that we speak of as "freezing," as well as blood and milk, which we speak of as "congealing," undergo. (2) "Things that solidify solidify because they are

either water or a mixture of earth and water, and do so due to either dry heat or cold" ($382^{b}31–33$).

Sôma: **Body**

Sophia: **Wisdom, Theoretical**

Sophist (*sophistês*): *Sophistês* stems from *sophos* ("wise"). The sophists, who first appear in Athens in the mid-5th cent BC, were itinerant, fee-charging teachers of rhetoric, ethics, and other subjects relevant to public life, and Aristotle sometimes refers to them as such (*Pol*. $1280^{b}11$). More often, though, he represents the sophists in a negative light as pretenders to philosophical knowledge and employers of sophistical or fallacious arguments: "Sophistry is apparent wisdom, not real wisdom; and a sophist is someone who makes money from apparent but not real wisdom" (*SE* $165^{a}21–23$). (*SE* is devoted to an examination of such arguments. Other significant discussions are found at *Met*. $1004^{b}17–26$, $1026^{b}14–24$, $1061^{b}5–11$, *Rh*. $1355^{b}15–21$, and more causal remarks of the same negative tenor at *APo*. $71^{b}10$, $74^{b}23$, *Top*. $126^{a}31$, *Ph*. $219^{b}20$.) This negative attitude was not special to Aristotle. It was also shared by Plato, and by Athenians more generally, who were not always careful to distinguish sophists from other thinkers and teachers. A decree introduced sometime in the 430s BC provided for the impeachment of "those who do not believe in what has to do with the gods or teach theories about what is up in the sky" (Plutarch, *Pericles* 32.32)—teachings which identified one as a sophist (Plato, *Apology* 19b–d). It may be that this decree was the legal basis of Socrates' indictment in 399 BC, and for that of many other intellectuals, including Anaxagoras, Diagoras, Protagoras, Euripides, and later, in 323/2, of Aristotle himself (F223). A reference to this may lie behind the claim at *Rh*. $1397^{b}24–25$ that "if generals are not base because they are often put to death, neither are sophists."

Sôphrosunê: **Temperance**

Sort of Thing (*poion*): An account or definition consists of a kind and a difference (*Met*. $1027^{b}29–30$), of which the kind is stated first: "the kind . . . is meant to signify the what-it-is, and, of the things mentioned in the definition, is put first" (*Top*. $142^{b}27–29$). Sometimes both elements are included in the what-it-is: "the kinds and the differences are predicated in the what-it-is" ($153^{a}17–18$; also *APo*. $91^{b}28–30$, $97^{a}23–25$). But sometimes the kind tells us what the thing is while the differences tell us what sort or quality of thing it is: "no difference signifies a what-it-is but rather a quality" (*Top*. $122^{b}16–17$; also $128^{a}26–27$, *Met*. $1020^{a}33$).

Soul (*psuchê*): Unlike souls as we conceive them, which are supposedly found only in "higher" beings like us, Aristotelian souls are found wherever there is life and movement: souls are animators; animate things are ensouled. All plants and animals, however primitive or simple, have some sort of soul. Moreover, unlike Cartesian souls or souls as conceived by some religions, Aristotelian souls (the understanding aside) are tightly tied to the bodies whose souls they are: "It is necessary, then, for the soul to be substance as

form of a natural body that has life potentially" (*DA* 412^{a}20–21). An ensouled body is thus a matter-form compound whose body is matter and whose soul is form. Although the various sorts of soul are found separated from each other in other living things, they are also found hierarchically organized within the human being, with higher ones presupposing lower ones (*Pol*. 1333^{a}21–30, 1334^{b}15–17). On the lowest rung in the hierarchy is nutritive soul, responsible for nutrition and growth. It is the only sort of soul possessed by plants. The next rung up is perceptual soul, responsible for perception and for the feeling and appetite that cause animal movement. Together with nutritive soul it is found in all animals. In human beings, both are constituents of the non-rational part of the soul. The third sort of soul, found only in human beings, is rational soul, which comprises the part of the soul that has reason and the understanding. Looked at from the bottom up rather than from the top down, this hierarchy is teleological: lower sorts of soul and their works are for the sake of the higher ones. The uniform parts, such as flesh, and their works thus exist for the sake of the non-uniform or structured parts and their works. Among the latter parts, the perceptual organs are particularly important with regard to survival, which is essential for all other functioning (*DA* 434^{a}21–^{b}24). In animals with rational soul, the perceptual modalities (especially smell, hearing, and sight) "report many differences, from which practical wisdom concerning intelligible objects and things doable in action comes about" (*Sens*. 437^{a}2–3), and so also exist for the sake of the good. Finally, practical wisdom, though it exists for its own sake, also exists for the sake of the understanding (*NE* 1145^{a}6–9). Understanding, then, is at the teleological peak of the organization, and so is the final or teleological cause of everything else in it.

Soul, Parts of: Aristotle uses terms ending in *-ikon* in his discussions of the soul and its functions—for example, *aisthêtikon* (*DA* 432^{a}30), *bouleutikon* (†*MM* 1196^{b}16), *dianoêtikon*, *doxastikon*, *epistêmonikon* (*NE* 1139^{a}12), *epithumêtikon* (1102^{b}30, 1119^{b}14), *logistikon* (1139^{a}12), *orektikon* (1102^{b}30), *phantastikon* (*DA* 432^{a}31), *phutikon* (*NE* 1102^{b}29), *threptikon* (*Juv*. 468^{a}28), *thumikon* (*DA* 432^{a}25, 433^{b}4). Sometimes he uses the term "part (*meros*, *morion*)" to refer to some of these: the *aisthêtikon* is the "perceptual part" at *Ph*. 247^{a}17 and the *noêtikon* the "understanding part" at 247^{b}1; the *dianoêtikon* is the "thinking part" at †*MM* 1182^{a}18. Sometimes, he omits the term, but it seems implied, so that, e.g., the *doxastikon* is "the believing part" at *DA* 413^{b}30 (notice *moria* at 413^{b}28), while *to phantastikon* is the "imaginative part" at 432^{a}31 (notice *moria* at 432^{b}2).

Parts can be separable from other parts: the nutritive part is separable from all the other parts (*DA* 411^{b}27–30, 413^{a}25–^{b}9, 434^{a}22–30, ^{b}9–25); the perceptual part, while not separable from the nutritive, is separable from the rationally calculative or deliberative part (*DA* 433^{b}30–31, *NE* 1149^{a}9–11, *Pol*. 1260^{a}12); the understanding part is separable from the other parts even in animals that have both it and them (*DA* 408^{b}18–26). Parts can also be inseparable parts of other parts: it would be "absurd" to break up the *orektikon* ("desiring part"), which comprises the *epithumêtikon* ("appetitive part") and the *thumikon* ("spirited part") (432^{b}5–6).

Parts can be identical, like the *logistikon* and the *doxastikon* (*NE* 1140^{b}26), but differ in being (*Insomn*. 459^{a}15–17). They can also, which may amount to the same thing, be distinct in account: "the remaining parts of the soul are not separable . . . ; but that they are distinct in account is evident; for the perceptual part and the believing part are distinct, if indeed perceiving and believing are, and similarly for each of the others mentioned" (*DA* 413^{b}27–32); or "both in account and in capacity" (432^{b}3–4).

It is clear, then, that calling things "parts" of the soul should not be taken to imply that they are separable parts of it or that they are distinct from other things called "parts." As Aristotle himself puts it: "which of them [the imaginative part] is the same as and which it is distinct from involves much puzzlement, if one is to posit separate parts of the soul" (*DA* 432^{b}2–3; cf. *NE* 1102^{a}28–32). About the distinction between a soul's parts and its capacities too he signals some indifference: "Let us now, then, leave aside the other parts or capacities of the soul (whichever they should be called)" (*Juv*. 467^{b}16–18).

Soul-involving (*psuchikon*): Both starting-points (*GA* 737^{a}8, 751^{b}6, 762^{a}26, 762^{b}17) and heat (732^{a}18, 739^{a}11, 752^{a}2, 755^{a}20, 762^{a}20) are said to be soul-involving. See **Breath**

Sound (*psophos*): "The movement of something that can be moved in the way in which things bounce back from a smooth surface when someone strikes it" (*DA* 420^{a}21–22).

Spatial Movement (*phora*): (1) Usually movement with respect to place (*Top*. 122^{a}22–30, *Ph*. 243^{a}35–40), but sometimes distinguished from it (*Top*. 122^{b}31–35). (2) "Spatial movements caused by something else are of four forms: pulling, pushing, carrying, and rotating" (*Ph.* 243^{a}16–17).

Special Affection (*idion*): (1) "A special affection is one that does not indicate the essence of a thing, belongs to that thing alone, and is counterpredicated of it. Thus it is a special affection of humans to be receptive of grammar; for if someone is human, he is receptive of grammar, and if he is receptive of grammar, he is human" (*Top*. 102^{a}18–22). (2) "But since of what is special one part signifies the essence and another part does not signify it, let us divide what is special into both of the parts just stated, and let us call the part that signifies the essence a 'definition,' while the remaining part, in keeping with the name commonly assigned to them, may be called a 'special affection'" (101^{b}19–23). Putting (1) and (2) together shows that there are two sorts of Aristotelian special affections: (3) definitions, which are obviously counterpredicated of what they define, but do express the essence of the thing defined (101^{b}21–22, 101^{b}38); (4) those that are counterpredicated of their subject (so that each is predicated of the other) but are not—or do not signify, or express—its essence, and so are not definitions. Those in (4) are Aristotelian special affections in the strict sense; those in (3) are special affections in an extended sense. To these we may add (5) a popular sense, in which A is special to B if and only if A always accompanies B and belongs to B alone (*Top*. 122^{a}22–28, 131^{b}8–9). (6) A further, temporal sense gives us now-special affections

(131^{b}5). In this sense, A is a now-special affection of B if and only if at the time that is now, A is either a strict or popular special affection of B.

Special Object of Perception (*idion*): "Whatever cannot be perceived by another perceptual modality, and which we cannot be deceived about—for example, sight is of color, hearing of sound, taste of flavor, while touch has several different ones" (*DA* 418^{a}11–14).

Speculation, Observation (*theôrêma*): A *theôrêma* is an object of contemplation (*Mem*. 450^{b}26, *NE* 1066^{a}26), so that *theôrêmata* (plural) are often theoretical views or speculations (*Somn*. 455^{a}25, *Mete*. 345^{b}2), such as the mathematical speculations mentioned at *Met*. 1093^{b}15. But they can also be (perhaps theory-laden) observations, like the astronomical ones mentioned at *Mete*. 339^{b}8.

Speech (*dialektos*): "The articulation of voiced sound by means of the tongue" (*HA* 535^{a}30–31).

Speech (*lexis*), **Parts of**: Distinguished and defined in *Po*. 20.

Sperma: **Seed**

Spine, Fish-spine (*akantha*): The analog of bone in boneless animals (*HA* 511^{b}6–7), but also the spines on a hedgehog (517^{b}24) and the like.

Spiral Shell (*strombôdês*): When the term is hyphenated ("spiral-shell") it refers to the animal; when unhyphenated it refers to the shell.

Spirit (*thumos*): Aristotle often uses *thumos* and *orgê* ("anger") interchangeably (*Rh*. 1369^{b}11), and very often uses *thumos* in contexts where its aggressive side is highlighted (*NE* 1116^{b}23). In other places, however, he says only that anger is "in (*en*)" the spirited part (*Top*. 113^{a}36, 126^{a}10), alongside other feelings, such as fear and hatred (126^{a}8–9). He also identifies spirit as the source not just of "negative" feelings but also of love and friendship: "spirit is what produces friendliness; for it is the capacity of the soul that makes us disposed to love" (*Pol*. 1327^{b}40–1328^{a}1). This is in keeping with his claim that if hatred is in the spirited part, then love, as its contrary, must be there too (*Top*. 113^{a}33–^{b}3). Presumably, then, we should think of spirit as passionate—"hot and hasty" (*NE* 1149^{a}30)—rather than as always aggressive.

Spit-lamp (*obeliskoluchnion*): A military tool that could be used either as a roasting spit or as a lamp holder (*PA* 683^{a}25, *Pol*. 1299^{b}10).

Sponsor (*prostatês*): See **Champion**

Spontaneous (*automaton*): Living beings that come to be by chance are said to come to be spontaneously or to be spontaneously generated from "some sort of composition from a seed-like starting-point" (*HA* 539^{a}18). The fullest catalog is given in *HA* 5.19.

Spoudaios: **Excellent**

Standard (*kanôn*): (1) "By the straight we know both itself and the crooked; for the standard straightedge is a judge of both, while the crooked is a judge neither of itself nor of the straight" (*DA* 411^{a}5–7). (2) "Each state [of character] has its own special set of things that are pleasant or noble, and the excellent person is perhaps distinguished most by his seeing what is true in each case, since he is like a standard and measure of them" (*NE* 1113^{a}31–33). (3) "The standard of what is indeterminate is itself indeterminate, just like the lead standard used in Lesbian-style building; for the standard is not fixed but adapts itself to the shape of the stone" (1137^{b}29–32). (4) "The wish of human beings . . . is not a safe standard" (*Pol*. 1272^{b}6–7). (5) "One should not distort [the judgment of] the judge by arousing anger, fear, or pity in him; for this would be as if someone who is going to use a standard [first] made it crooked" (*Rh*. 1354^{a}24–26).

Star (*astêr*, *astron*): *Astêr* refers to a planet at *Mete*. 343^{b}30, 33, but to a fixed star at *Cael.* 298^{a}3. *Astron* (usually in the plural: *astra*) is used explicitly for both fixed stars and planets (*Mete*. 346^{a}2) in contrast to the sun and moon (*Cael.* 278^{b}18, 292^{a}1), and for planets in contrast to these (*Mete*. 341^{a}22). It seems to be used less frequently for the shooting stars and comets (346^{b}12) than *astêr*, which is used for shooting stars (341^{a}33, 341^{b}3, 28, 34, 342^{b}4, 21, 344^{a}15, 28, 32) and for comets (343^{b}5, 344^{a}20, 34, 345^{b}12, 35).

Starting-point (*archê*): "The cause of many things, with nothing above it being a cause of it" (*GA* 788^{a}15–16; also *EE* 1222^{b}30–31). There is no demonstration of starting-points (*GA* 742^{b}32–33); scientific knowledge of them is provided by understanding (*NE* 1141^{a}7–8). A common translation of *archê* is "first principle," but as a uniform translation "starting-point" is preferable. See **Rule**

Stasis: **Faction**

State (*hexis*): (1) When related to a privation, as in *Met*. 5.22, a *hexis* is a having. (2) When related to a capacity, a *hexis* is the penultimate stage in its development or completion of a capacity, and is a relatively stable condition (*Cat*. 8^{b}25–9^{a}13) ensuring that a thing is "well- or ill-disposed, and either intrinsically or with reference to something else" (*Met.* 1022^{b}10–12). (3) More narrowly, a state is a condition "due to which we are well or badly off in relation to feelings" (*NE* 1105^{b}25–26). (4) "The things in accord with which someone is of a certain sort in life; for lives are not of the same sort in accord with every state" (*Rh*. 1408^{a}29–30).

Statement: See *Logos*

Stear: **Suet**

Sterêsis: **Privation**

Stock, True to One's (*gennaios*): See **Breeding, Good**

Stoicheion: **Element**

Stomach (*koilia*): The term *koilia* sometimes refers to (1) the stomach plus the bowel (i.e., the intestinal tract as a whole) (*PA* 650^{a}13); (2) the stomach alone (673^{b}12);

(3) the bowel alone (*GA* 728^{a}15); (4) the first of a ruminant's four stomachs, or the entire set of four (*HA* 507^{b}1–11).

Stomachos: **Gullet**

Strigil (*stleggis*): An instrument with a curved spoon-like blade used to scrape off sweat and dirt after exercising. At *Top*. 145^{a}23 it is a device for drawing off wine from a cask.

Strombôdês: **Spiral Shell**

Struphnos: **Astringent**

Studies in Circulation (*egkuklia*): See **External Accounts**

Study, System (*pragmateia*): Aristotle often refers to one of his investigations of a subject, regardless of its sort, as a *pragmateia* (*Top*. 100^{a}18, *Ph*. 194^{b}18, *NE* 1103^{b}26, 1105^{a}11), which is usually broader in connotation than what we would call a "treatise" (*SE* 183^{b}35). He also uses it to refer to a philosophical or other sort of system that might be embodied in many different treatises or practices (*SE* 183^{b}28, *Met*. 986^{a}8, 987^{a}30) and in a looser sense to any sort of business (*Top*. 155^{b}27) or dealings (*Rh*. 1376^{b}4).

Substance (*ousia*): *Ousia* is a noun that is perhaps formed from the present participle *ousa* of the verb *einai* ("to be"). "Substance" is the traditional translation. (1) The substance *of* something is its what-it-is or its essence. (2) *A* substance, on the other hand, is a this something—an ultimate subject of predication, of which a particular human or a particular horse are examples.

Substance, Primary: (1) "Substance in the strictest sense, that which is primarily and most of all called 'substance,' is what is neither said of any subject, nor is it in any subject—for example, a particular human or a particular horse. What are called 'secondary substances' are the forms that the things primarily called 'substances' are instances of, both these forms themselves and the kinds of these forms" (*Cat*. 2^{a}11–16). (2) "What is not said to *be* by being one thing in another, that is, in an underlying subject as matter" (*Met*. 1037^{b}3–4). (3) "What is intrinsically intelligible is the one column [of opposites], and in this substance is primary, and in this the one that is simple and in accord wth activity [is primary]" (1072^{a}30–32).

Substance, Secondary: "The forms that the things primarily called 'substances' are instances of, both these forms themselves and the kinds of these forms—for example, the particular human is an instance of the form human, and the kind of the form is animal" (*Cat.* 2^{a}14–19).

Suet (*stear*): A sort of concocted blood (*PA* 651^{b}6–7), like fat, but different in nature from it. Discussed in *HA* 3.17–18, *PA* 2.5.

Suggnômê: **Sympathetic Consideration**

Sunesis: **Comprehension**

Sunolon: **Compound**

Sunthesis: **Composition, Composite**

Superfetation (*epikuêma*): For Aristotle superfetation occurs when eggs produced at two different periods are fertilized by earlier and later impregnations, but it can also occur when eggs produced at the same period are fertilized by two different impregnations (this is now called superfecundation). It is discussed in *GA* 4.5.

Supervision (*epimeleia*): Supervision (*epimeleia*) of X, which involves taking care of (*epimeleisthai*) X, is often exercised by a type of craft or science that has X's welfare as its end or goal: a king supervises his subjects to ensure that they do well (*NE* 1161^{a}13), medicine supervises the sick with the aim of making them healthy (1180^{b}17), and "the gods exercise a sort of supervision over human affairs" and "reward those who most like and honor [understanding]" (1179^{a}24–29).

Supposition (*hupolêpsis*): *Hupolêpsis* is like belief, but unlike scientific knowledge, in that it can be false as well as true (*NE* 1139^{b}17). It differs from belief in that what one believes is "already a sort of affirmation" (1142^{b}14), whereas "*hupolêpsis* is that by which we play a double game with everything, as to whether it is so or not so" (†*MM* 1197^{a}30–31). See **Double Game, Play A**

Surface (*epiphaneia*): Often used as an equivalent of *epipedon* ("plane").

Sussitia: **Communal Messes**

Sustasis: **Composition**

Sustoichia: **Column**

Swift (*drepanis*): Literally, "sickle-bird" (from the shape of its wings). Its precise identity is unclear. Perhaps, in particular, the Alpine swift.

Sycophant (*sukophantês*): Athenian law provided rewards to those who successfully prosecuted cases that enriched the city (such as recovered tax revenues or property confiscated because of the offense). By the late 5th cent BC this led to the practice of sycophancy, which consisted in bringing (often bogus) suit against someone in hopes either of getting a bribe from him for dropping the suit or of getting a reward from the city if the suit proved successful.

Syllogism: See **Deduction**

Sympathetic Consideration (*suggnômê*): Discussed in *NE* 6.11.

Synonymous (*sunônumos*): "Things are said to be synonymous when they have both a name in common and the account that corresponds to the name is the same—for example, both a human and an ox are animals; for each of them is called by the same name, 'animal,' and, moreover, the account is the same; for if one gives an account of what it is for each of these to be what it is, an animal, one will give the same account" (*Cat*. 1[a]6–12).

Teaching (*didaskalikê*): *Didaskalikê* is essentially language based (*HA* 608[a]17–21). In the strict sense, it involves formal instruction in a craft or science that results in scientific knowledge of causes: (1) "Those people teach who state the causes of each thing" (*Met*. 982[a]29–30). (2) "Argument in accord with scientific knowledge is teaching" (*Rh*. 1355[a]25–26).

Technê: **Craft**

Technitês: **Craftsman**

Tekmêrion: **Proof**

Teleios: **Complete**

Telos: **End**

Temperance (*sôphrosunê*): Focally discussed in *NE* 3.10–11, *EE* 3.2. See **Virtue, Human**

Teras: **Monstrosity**

Term: See **Defining Mark**

That, the (*to ti*), **the Why** (*to dia ti*): "Experienced people know the that but do not know the why, while craftsmen know the why, that is, the cause" (*Met*. 981[a]28–30). The focal discussion is *APo*. 1.13.

The + Noun: Noun phrases consisting of the definite article plus a noun ("the N") are ambiguous (homonymous) in English, since they can be either singular terms referring to unique particulars ("The dog bit me") or generic terms ("The dog is a domestic animal"). Similarly in Greek "something is said to be the circle homonymously, [since the term is applied] both to the one said to be such unconditionally [the generic or universal circle] and to the particular one" (*Met*. 1035[b]1–3). In the biological treatises (*HA*, *PA*, and *GA*), the + noun ("the human being," "the sheep") generally refers to the kind, not to a particular instance of the kind.

Theôrein: See **Practical**

Theôrêma: See **Speculation**

Theoretical Grasp on, Get a (*theôrein*): The verb *theasthai*, with which *theôria* is cognate, means "to look at" or "gaze at" or "view." Hence *theôria* itself is sometimes what someone is doing in contemplating, investigating, looking closely at, observing, or viewing (as at *Po*. 1450^{b}38, 1451^{a}1) something. *Theôria* can thus be an exercise of understanding (*nous*), which is the element responsible for grasping scientific starting-points (*NE* 1141^{a}7–8), such as (the definition of) right angle in the case of geometry or (the definition of) happiness in the case of ethics and politics. As a result, the verb *theôrein* sometimes means "to be actively understanding" or "to be actively contemplating" something. Often "get a theoretical grasp on" seems to convey the right sense.

Thêriôdês: **Beast-like**

Thês: **Laborer, Hired**

Thesis (*thesis*): Defined at *Top*. 104^{b}19–35.

Thin (*leptos*): See **Coarse-grained**

Third man (*tritos anthropos*): The argument is mentioned at *SE* 178^{b}36–37 and *Met*. 990^{b}17, given at F174 (83.1–85.12), discussed in some detail at *Met*. 1031^{b}28–1032^{a}4, and the problem with it succinctly characterized at 1038^{b}34–1039^{a}3.

This (*tode*), **This Something** (*tode ti*)
Tode ti involves a particularizing element and a generalizing element. Here the demonstrative pronoun *tode* is taken as particularizing (as suggested by *Met*. 1030^{a}5–6) and the indefinite pronoun *ti* as generalizing, but since *tode* need not be particularizing (as it may not be at 1032^{b}6–21) and *ti* may be, it is possible to go the other way and translate as "thing of a certain sort."

In very many cases, being a *tode ti* is a distinctive mark of an *ousia* ("substance"), and so has some share in the ambiguity of the latter, as between an ultimate subject of predication and the substance or essence of something. This is reflected in the fact that a particular man and a particular horse are primary substances (*Cat*. 2^{a}11–14), so that "it is indisputable and true that each signifies a *tode ti*" (3^{b}10–12), while at the same time what is separable and a *tode ti* is "the shape or form of each thing" (*Met*. 1017^{b}24–26; also 1042^{a}27–29, 1049^{a}35, 1070^{a}11). Some things, though, are one and the same as their forms or essences—which would remove the ambiguity at least in their cases—but it is not true that all are (1037^{a}33–^{b}7).

As strong as the connection between substance and being a *tode ti* is the disconnection between being a *tode ti* and being a universal—"no common thing signifies a this

something but a such-and-such sort of thing" (*Met*. 1003^{a}8–9; also 1039^{a}15–16)—and the connection between being substance and being a *kath' hekaston*: "If one does not posit substances to be separate, and in the way in which the *kath' hekasta* are said to be separate, one will do away with the sort of substance we wish to maintain" (1086^{b}16–19). Apparently, then, a form that is a primary substance—as some are explicitly said to be (1032^{b}1–2)—must be a *kath' hekaston*.

A *kath' hekaston*, in turn, is "one in number" (*Met*. 999^{b}34–1000^{a}1), so that no two things can be one and the same *kath' hekaston*. Hence it is translated as "particular." But it is also possible to take "one in number" to mean "indivisible" or "individual," so that like an ultimate difference—identified with form and substance at 1038^{a}25–26—something is *kath' hekaston* because it cannot be further divided or differentiated.

As we try to disambiguate *tode ti*, then, we run into ambiguities that parallel the initial one in substance itself, or that are related to it. That this may be no accident, but rather the heart of the issue, is suggested by *Met.* 1087^{a}19–21.

Finally, a point about matter. What *Ph*. 190^{b}25 refers to as "countable matter," and treats as a generalization of such things as the human and the bronze, is "more a this something," as, no doubt, is the "this (*todi*) wood of this [box]" at *Met*. 1049^{a}24 and the "this (*toudi*), which is bronze" at 1033^{b}2, from (some or all of) which the smith makes this brazen sphere. But these are particular identifiable and countable parcels of matter—minimally shaped up by form, perhaps, but enough to count as (low-grade) *tade tina*. Matter taken more generally, however, is "what not being actually a this something is potentially a this something" (1042^{a}27–28).

Thorax: "The cavity from the neck to the sex organs is called the 'thorax'" (*HA* 491^{a}29–30).

Thoros: **Seminal Fluid**

Thought (*dianoia*): *Dianoia* is often contrasted with the body (*Pol*. 1270^{b}40, 1335^{b}16–17), making "mind" seem a natural translation of it. But unlike the mind, which includes perception, imagination, belief, knowledge, and desire, *dianoia* is contrasted with each of these. It is not perception because all animals have that, while "many do not have *dianoia*" (*DA* 410^{b}24). It is not imagination because, as we might put it, *dianoia* is propositional, or operates on things that can be true or false, affirmed or denied (*Pol*. 1273^{a}22), while imagination is a representational state that is more like perception, more "imagistic." Hence "what affirmation and denial are in the case of thought, that, in the case of desire, is precisely what pursuit and avoidance are" (*NE* 1139^{a}21–22). Unlike belief and knowledge, however, "thought is not yet affirmation" (1142^{b}13), making it natural to think of it, or some of it anyway, as the process of reasoning that can culminate in a belief or an affirmed proposition. *Dianoia* is not desire, because, while desire can cause animal movement, without thought, as it does in the case of non-rational animals, "thought by itself . . . moves nothing" (1139^{a}35–36).

Thrattai: Perhaps shad; the identity is uncertain.

Ti, to: **That, the**

Ti, to dia: **Why, The**

Tiktein: Birds and fishes "lay" eggs (or in the latter case "spawn"), insects "produce" larvae, animals (including human beings) "give birth." Aristotle uses the verb *tiktein* for all of these.

Time (*chronos*): (1) "Time is a number belonging to movement with respect to the before and after" (*Ph*. 220^{a}24–25). (2) "Time is a measure of movement" (220^{b}32–221^{a}1) that does its measuring by "defining some movement that will measure out the whole (just as the cubit measures length by defining some magnitude that will measure out the whole), and for a movement to be in time is for both it and the existence of it to be measured by time" (220^{b}32–221^{a}5). A unit of time is something like a least discernible length of time—call it "one second." Seconds, then, are the units in which the time taken by a spatial movement M is measured. To ask how long M is is thus to ask what number of seconds M takes. And the way to determine that number is to tick off a second S_1 at the now (or instant) at which one second has passed since the start of M, S_2 at the now at which one more second has passed, and so on, until at S_n a now is reached at which M finishes. The length of M is n seconds. And the now, because of the role it plays in determining n, is like a unit of time.

Timê: **Honor**

Timêma: **Property Assessment**

Timios: **Estimable**

To ti ên einai: **Essence**

To ti esti: **What-it-is, the**

Token (*sumbolon*): *Sumbola* (plural) were originally two pieces of a bone or coin that uniquely fit together, enabling a person with one to recognize a person with the other. At *GC* 331^{a}24 Aristotle uses *sumbolon* to refer to a difference shared by two consecutive elements, like the cold in earth and water. When water becomes earth, then, only one difference has to be changed (dry to wet), which makes that change easier than one in which both differences have to be changed.

Tokos: **Offspring**

Topic (*topos*): "Dialectical and rhetorical deductions are those concerned with what we call 'topics,' which are common when they concern what is just, what is natural, what is political, and many things that differ in form—for example, the topic of the more and the less" (*Rh*. 1358^{a}10–14). These topics, moreover, are the elements of enthymemes (the rhetorical equivalent of dialectical deductions): "By 'element' and 'topic' of an enthymeme I mean the same thing" (1396^{b}22). Two sorts of things in a deduction are what we might intuitively call "elements," namely, premises and a logical form determi-

native of the deduction's syllogistic mood, which is something like a rule of inference. And in fact common things seem to include such rules or premises expressing them: "By 'the starting-points of demonstration' I mean the common beliefs on the basis of which we all prove things, such as that in every case it is necessary either to affirm or deny, and that it is impossible for something at the same time to both be and not be, and any other propositions like that" (*Met*. 996^{b}27–29). In keeping with this idea is the identification of topics with acceptable beliefs (*Rh*. 1402^{a}32–34). Apparently somewhat at odds with it is their characterization as something "into the province of which many enthymemes fall" (1403^{a}19). But a common premise (or premise for a dialectical deduction) is also something that can serve as a mnemonic device—a *topos*—for arguments, and as such is an item into the province of which these arguments fall (*Top*. 163^{b}22–33). In one way topics are common premises; in another they are common premises serving as reminders of correlative arguments. They are thus at once headings in those catalogs of evidence that are all important in any science and items falling under them.

Trachutês: See **Roughness and Smoothness**

Tragedy (*tragô[i]dia*): Defined in *Po*. 6.

Tribe (*phulê*): In the system developed by Cleisthenes for Attica in 508/7 BC, the land was divided into three zones: city, shore, and inland. Each of these was in turn divided into ten sections called *trittyes*, to each of which was assigned between one and ten of the 139 existing settlements, including villages and towns, which were all called "demes." Three units, one drawn from each of the three zones, were put together to form a tribe. See *Ath*. 21.1–6.

Trophê: **Nourishment**

Trumpet Shell (*kêrux*): When the term is hyphenated ("trumpet-shell") it refers to the animal; when unhyphenated it refers to the shell.

Truth (*alêtheia*)

One sort of truth Aristotle recognizes is plain, or theoretical, truth, which is a feature of propositions, statements, or thoughts: "to say of what is that it is not, or of what is not that it is, is false, while to say of what is that it is, or of what is not that it is not, is true" (*Met*. 1011^{b}26–27). About such truth, as about scientific knowledge, he is a realist: "it is not because we truly think you to be pale that you are pale, but it is because of your being pale that we who say this grasp what is true" (1051^{b}6–9).

Another sort, practical truth, which is "truth in agreement with correct desire" (*NE* 1139^{a}30–31), is plain truth plus something. The idea is this: For an agent A's deliberation to be correct (a) it must result in a conclusion C prescribing that A do X, which in his circumstances is what best furthers his happiness. Moreover, (b) the desire D that comes about as a result of that deliberation must be correct, that is, it must be a desire to do X. And (c) D must be effective in producing X. When as a result A does

X, his action makes C a practical truth—something made true by a *praxis* or action. Notice: "the truth in practical matters must be judged from the works and the life; for these are what have the controlling vote" (*NE* 1179^{a}18–20).

A third sort of truth is "objectual" truth (*Met*. 1027^{b}18–33). Both it and falsity are present in objects, unless the objects are either simple (non-composite) or essences that involve no reference to matter, in which case only objectual truth can be present, since no combination or separation is involved in them (*Met.* 1051^{b}17–1052^{a}4): "Understanding is not like that in every case; on the contrary, that of the what-it-is in the sense of the essence is true, and is not something [predicated] of something. However, just as the seeing of a special object is true, but seeing whether the pale is a human or not is not always true, so it is also with [understanding] what is without matter" (*DA* 430^{b}27–31). See **Deliberation**; **Phrase**

Tuchê: **Luck**

Tupos: **Outline**

Tyranny (*turannis*): A deviant sort of kingship that consists in the rule of involuntary subjects (*Pol*. 1313^{a}14–16, 1314^{a}34–38) by one master, who aims at his own advantage rather than that of the community as a whole (1279^{b}6–7). It is a mixture of ultimate oligarchy and ultimate democracy (1310^{b}2–7), and is the worst constitution of all, and the one that is furthest from being a true constitution (1289^{b}1–2, 1293^{b}27–30). If a tyrant listens to good advice, however, he will rule in a more moderate way and will either be "nobly disposed to virtue or else half good, not wicked but half wicked" (1315^{b}9–10). The various sorts of tyranny, discussed in 3.14 and 4.10, include foreign kingship and dictatorship.

Unacceptable (*paradoxos*): Contrary (*para*) to belief (*doxa*), including acceptable belief, and so unacceptable as a premise or conclusion, particularly in dialectical argument.

Unconditionally, Simply (*haplôs*): The adjective *haplous* means "simple" or "single." The adverb *haplôs* thus points in two somewhat opposed directions: (1) To speak *haplôs* sometimes means to put things simply or in general terms, so that qualifications and conditions will need to be added later. (2) When opposed to what is complex, compound, or variegated, *haplous* means "simple" in the relevantly opposed sense (*HA* 603^{b}28–29). (3) Sometimes to be F *haplôs* means to be F unconditionally or in a way that allows for no ifs, ands, or buts (as at *Top*. 115^{b}29–35). In this sense, things that are F *haplôs* are F in the strictest, most absolute, and most unqualified way (*Met*. 1015^{b}11–12), so that what is unconditionally F is what is intrinsically F (*NE* 1151^{b}2–3). (4) *Haplôs* is also at times equivalent in meaning to *holôs* ("in general").

Underlying Subject, Condition (*hupokeimenon*): A *hupokeimenon* is often the underlying (*hupokeisthai*) subject that persists through change, as Socrates persists through

a change from being bearded to being clean-shaven. If the change in question is a substantial (or existence) change, so that it is the coming to be or passing away of a substance, as when Socrates dies, the *hupokeimenon* is matter.

Understanding (*nous*)
In the broadest sense of the term *nous* is what enables a soul to suppose, believe, deduce, calculate, reason, and believe, so that it is possible to *noein* something incorrectly (*DA* 427^{b}9). In the narrow sense, *nous* is what makes possible a type of knowledge of universal scientific starting-points that, unlike scientific knowledge proper, is not demonstrable from anything further (*NE* 1141^{a}7–8; also 1142^{a}25–26). This applies equally well in practical (1143^{a}35–^{b}5) or productive areas (*Met*. 1032^{a}32–^{b}17) as in theoretical ones.

In human beings, this *nous* is of two sorts, one productive or active, the other passive and analogous to matter (*DA* 3.5). Active *nous* may be the primary god himself or a divine substance (*NE* 1177^{b}28)—or anyway the most divine one—present in human beings (1177^{a}16), which, as such, shares in the immortality that is characteristic of gods (*DA* 430^{a}23). Consequently, it alone of these parts is separable from the human body and can survive its death (408^{b}18–25). Among sublunary animals this *nous* is fully possessed only by human beings (*PA* 656^{a}7–8, *NE* 1178^{b}24–25; cf. *HA* 610^{b}22). In fact, a human being is most of all his *nous* (*NE* 1168^{b}31–32, 1178^{a}2–8). In embryology too it is transmitted to offspring in a different manner than that of other types of soul (*GA* 736^{b}13–29).

Although often classified as a substance, *nous* is also sometimes classified as a state (*hexis*) of the soul that "grasps the truth by way of affirmation and denial" (*NE* 1139^{b}15). For in its case the distinction between a state and its activation collapses, since it is "in substance an activity" (*DA* 430^{a}18), though it must be in touch with an intelligible object in order to grasp the truth about it (*Met*. 1072^{b}20–21).

Uniform (*homoiomerês*): Something is uniform in the strict sense if its parts, however small, are of the same sort as the whole (*PA* 647^{b}17–20).

Unit (*monas*): "What is indivisible in quantity, when it is indivisible in all dimensions and lacks position" (*Met*. 1016^{b}24–25).

Universal (*to kath' holou*): (1) Universals (which include forms, qualities, and affections generally) are things that belong in common to many numerically distinct particulars (*Met*. 1038^{b}11–12), while particulars are things that are severally one in number and jointly many (999^{b}34–1000^{a}1). But sometimes what is *kath' hekaston* is what is less universal than something else. Thus, while perceptible particulars are indefinable (*Met*. 1039^{b}27–29, 1040^{a}27–^{b}4), it is "easier to define *to kath' hekaston* than the universal" (*APo*. 97^{b}28), and a definition of a universal divides it into *kath' hekasta* (*Ph*. 184^{a}23–24), where these are things that are particular in the sense of being "indivisible in form" (*PA* 644^{a}30–31). (2) A universal premise or proposition is one that holds in every case and always (*APo*. 96^{a}15). (3) In the *Poetics* the universal

is "the sort of thing that a certain sort of person would say or do, in accord with likelihood or necessity, which is what poetry aims at, while adding proper names" (1451^{b}8–10).

Universe, the: *to pan*

Unlimited (*apeiron*): "Nothing is actively unlimited, and is potentially so only in the direction of division" (*GC* 318^{a}20–21). The unlimited—or "infinite"—is focally studied in *Ph*. 3.4–8.

Unrefined (*banausos*, *phortikos*): When *banausos* is applied to crafts, it is defined and distinguished from *phortikos* and *chrêmatistikos* as follows: (1) "By *phortikos* I mean those undertaken with a view to reputation only; by *banausos* I mean the sedentary ones and wage-earning ones; by *chrêmatistikos* I mean the commercial ones related to buying and selling" (*EE* 1215^{a}30–33). (2) "Any work should be considered *banausos*, and so too any craft or branch of learning, if it renders the body, the soul, or the thought of free people useless for the uses and actions of virtue" (*Pol*. 1337^{b}8–11). However, Aristotle's use of the terms is not always consistent with these definitions. The most *phortikos* people suppose happiness to be bodily pleasure (*NE* 1095^{b}16), to show oneself superior to humble people is *phortikos* (1124^{b}22), as is going to excess in trying to make people laugh (1128^{a}5) and praising the gods for being temperate (1178^{b}16). A person who spends more than one should is *banausos* (1123^{a}19), and *banausia* itself consists in "being extravagant in circumstances one shouldn't and in ways one shouldn't" (1122^{a}32–33), but many other things that have nothing to do with the use of wealth are also *banausos*, such as playing music rather than listening to it (*Pol*. 1339^{b}9, 1340^{b}34, ^{b}41, 1341^{a}7, ^{b}14), though some of the pleasure it produces is *phortikos* (1341^{b}13). Not to work at any *banausos* craft is noble, "for it is characteristic of a free person not to live in dependence on others" (*Rh*. 1367^{a}32), while a craft concerned with delivery is *phortikos* (1404^{a}1). A common translation of these terms is "vulgar," but in the relevant sense this is not now in common use.

Unscrupulous (*panourgos*): An unscrupulous person is ready to do anything, and so "tries to get more in every way and from every source" (*EE* 1221^{a}36). That is to say, he takes as much as he can of money, honors, bodily pleasures, and other goods of the sort that are greed's particular targets (*NE* 1168^{b}15–21), regardless of to whom they belong. As applied to animals such as the fox (*HA* 488^{b}20), *panourgos* means "cunning."

Up, Down; **Front, Back**; **Right, Left**: See **Place, Proper**

Vapor (*atmis*): (1) "Disaggregated water" (*Mete*. 340^{b}3). (2) "A disaggregation due to burning heat, from liquid into air and wind, capable of wetting things" (387^{a}24–26).

Virtue (*aretê*): Anything that has a work has a correlative *aretê*, the state of it that enables it to do that work well (*NE* 1098^{a}8–11). It is thus possible to speak of the *aretê*

of thieves, scandalmongers, and other bad things that are good at doing what they do (*Met*. 1021^{b}17–20), as well as of the *aretê* of inanimate tools and instruments.

Virtue, Human

A virtue of character is a "deliberately choosing state, which is in a mean in relation to us, one defined by a reason and the one by which a practically wise person would define it" (*NE* 1106^{b}36–1107^{a}2). Virtue of character as a kind is a relative (*Cat*. 6^{b}15–16), but the particular virtues (courage, temperance) and vices (cowardice, intemperance) are qualities, as is true of states generally (11^{a}23–32). It has different degrees, levels, areas of usefulness, sorts of activation, degrees of accessibility, and relativities.

Degrees: Virtue of character may be natural, habituated, or virtue in the strict sense (*Pol*. 1332^{a}38–^{b}8). In the strict sense, it involves understanding of the correct end (*NE* 1144^{b}9) and the possession of practical wisdom (1145^{a}1–2), while natural virtue and habituated virtue do not. A person with virtue in the strict sense may fail to do what is virtuous "because of things that overstrain human nature and that no one could endure" (1110^{a}25–26) without compromising his claim to such virtue. Someone with heroic virtue, on the other hand, has a degree of virtue exceeding the ordinary (1145^{a}18–20), and can endure many such things, and act virtuously. By the same token, greatness of soul (4.3) seems to go beyond an ordinary degree of virtue in the strict sense, since not every fully virtuous person is virtuous enough to have it.

Levels: Regardless of their degree, some virtues are apparently at a higher level of excellence, because they are more complete than others: "the human good turns out to be activity of the soul in accord with virtue and, if there are more virtues than one, then in accord with the best and most complete" (*NE* 1098^{a}16–18).

Areas of usefulness: "Courage and resilience are for unleisure, philosophy for leisure, and temperance and justice are useful during both, and particularly when people remain at peace and are at leisure" (*Pol*. 1334^{a}22–25), while magnificence requires "great sums" in order to be exercised (*NE* 1107^{b}18).

Activations: An activation of a virtue may be unconditional or on the basis of a hypothesis: "By 'on the basis of a hypothesis' I mean the necessary ones, by 'unconditionally' I mean what is nobly [done]. For in the case of just actions, for example, just penalties and punishments spring from virtue, but are necessary, and nobly [done] has [the quality of] necessarily [done]" (*Pol*. 1332^{a}10–14).

Degrees of accessibility: How accessible the virtues of character are to a given person depends in part on the factors just mentioned. This may help explain the different things Aristotle says on the question (focally at *Pol*. 1332^{a}36–^{b}8). Sometimes he paints a somewhat bleak picture: "It makes no small difference, then, whether people are habituated in one way or in another way straight from childhood; on the contrary, it makes a huge one—or rather, *all* the difference" (*NE* 1103^{b}23–25; also 1104^{b}11–13). But ethical improvement, even for those less fortunate in their upbringing, seems to pretty much always be possible (*Cat*. 13^{a}22–31), provided one is "not disabled in relation to virtue" (*NE* 1099^{b}19).

Relativity to self and others: Virtue of character may be used in relation to another person or in relation to its possessor himself: "for many people are able to use their virtue in what properly belongs to themselves but unable to do so in matters relating to another person" (*NE* 1129^{b}33–1130^{a}1).

Relativity to gender and nature: All these features apply to virtues of character regardless of who has them or what sort of constitution their possessor is situated in. But the gender and natural status of their possessor has important consequences for the sort of virtue he or she can develop and possess in any political constitution: the virtues of men, women, and (natural) slaves are different, because their works are different (*Pol.* 1.13).

Relativity to a constitution: The virtues discussed in *NE*, *MM*, and *EE* are those of (primarily) a good *man*. But it is only in the best constitution (discussed in *Pol.* 7) that the virtues of a good man coincide with those of a good citizen; in others, the virtues are relative to the constitution (*NE* 1135^{a}5, *Pol.* 1293^{b}3–6, 1276^{b}30–1277^{a}5) and further its characteristic conception of happiness (*Pol.* 1328^{a}41–^{b}2).

The virtues of thought, which are focally discussed in *NE* 6, are practical wisdom and theoretical wisdom. The first is the virtue of the deliberative (or rationally calculative) sub-part of the part of the soul that has reason: it involves all the virtues of character, which cannot be possessed in their strict sense without it (6.13). The second is the virtue of the scientific sub-part, and is "the best and most complete" one referred to at 1098^{a}17–18.

Viscous (*glischros*): "A thing is viscous when, being wet or soft, it is pullable. . . . And those that are not of this sort are crumbly" (*Mete*. 387^{a}11–15).

Voice, Voiced Sound (*phônê*): A voice is what makes a voiced sound, and a voiced sound is the sort that is made by a voice. (1) "The blow struck on the so-called windpipe by the air that is breathed in, due to the soul in these parts, is voiced sound" (*DA* 420^{b}26–29). (2) "Voiced sound is a sort of sound belonging to something animate" (420^{b}5–6). (3) "Voice and sound are distinct, and speech is a third thing" (*HA* 535^{a}27–28). (4) "It is most of all to [human beings] that nature has assigned this capacity, because they alone among the animals make use of speech, and the matter for speech is voiced sound" (*GA* 786^{b}19–22). (5) "A voiced sound is a sign of what is pleasant or painful. . . . But speech is for indicating what is beneficial or harmful, and so too what is just or unjust" (*Pol.* 1253^{a}10–15).

Voluntary (*hekôn*), **Involuntary** (*akôn*): The fullest discussion is in *NE* 3.1, 3.5, *EE* 2.7–9.

Wanton Aggression (*hubris*): "Doing or saying things that involve shame for the one who suffers them, not in order that something or other [beneficial] may come about for the agent himself, or because something [bad] has happened to him, but in order to take pleasure in it" (*Rh.* 1378^{b}23–25). In what is perhaps a looser sense, wild animals can also exhibit it (*HA* 614^{a}10).

Water (*hudôr*): Also, rain.

Wealth (*chrêmata*): "Everything whose worth is measured by money" (*NE* 1119^{b}26–27).

Wealth Acquisition, Craft of (*chrêmatistikê*): Because of complexity in the notion of wealth, the craft or science of acquiring wealth is of at least two different sorts. The natural sort is concerned with the acquisition (but not the use of natural wealth, and is a part of (*Pol*. 1253^{b}12–13) or assistant to (1256^{a}3–7) the craft of household management. The unnatural sort is the craft of commerce. In *Pol*. 1.11 a third sort, which "comes between" these two, is discussed; it deals with metals and other things extracted from the earth, and timber and other non-foodstuffs grown on it (1258^{b}27–31).

Weasel (*galeê*): *Galeê* is the name of various animals, including weasels and polecats, some of which were kept as house pets.

Weight (*baros*): When *baros* is contrasted with *kouphos* or *kouphotês* ("light," "lightness") it is "heavy" or "heaviness," but when it applies to whatever has either heaviness or lightness it is "weight." It helps to think of the contrast, as Aristotle does, in terms of tendencies to move to proper places. If something naturally tends to move down toward the center it has some degree of heaviness; if it tends to move upward, away from the center, it has some degree of lightness.

Weight, Balance- (*rhopê*): (1) A's heaviness (weight) is its non-comparative tendency to move downward; its lightness, its non-comparative tendency to move upward (*Cael*. 308^{a}29–33). A's balance-weight is its weight or lightness in comparison to B's, when A is in one pan of a (fair) balance or weighing-scale and B is in the other. If the A-pan moves downward, A has a greater balance-weight of heaviness than B, and a smaller balance-weight of lightness. (2) A *rhopê* is also the tilt or turn of the balance itself, whether literal or figurative (*Juv*. 474^{b}31, 478^{a}16).

Wet (*hugros*): See **Dry**

What-it-is, the (*to ti esti*): When we ask *Ti esti A*? we are asking what A is. The correct answer defines or expresses the what-it-is of A, or (a related notion) the being (*einai*) for A, or (another related notion) the essence or what-it-is-to-be of A, or (yet another related notion) the substance of A. Any intrinsic being, regardless of its category, has a what-it-is: "The what-it-is signifies in one way the substance and the this something, and in another way it signifies each of the other things that are predicated—quantity, quality, and the like . . . ; for we can also ask what quality is, and so quality too is something with a what-it-is" (*Met*. 1030^{a}18–24).

White (*leukon*): The opposite of black (*melan*), where black is "the non-transparent" (*GA* 780^{a}34–35). Thus, while *leukon* is usually "white" or "pale," it comes closer, perhaps, to meaning "clear" or "bright," i.e., the color of light, so that, unlike its English equivalent, it can be applied to horses, dogs, water, and sound.

White Sickness (*leukê*): Mentioned at *HA* 518^{a}13, *GA* 784^{a}26. Perhaps albinism, since it can affect the hair as well as the skin.

Whole (*holos*): A *holon* (nominalized adjective) is typically a matter-form compound, which is not identical simply to the sum of its parts: at *Met*. 1052^{a}22 a whole is what has a certain shape and form by nature, and at 1016^{b}12–13 not being "some sort of whole" is identified with "not possessing one form." At 1045^{a}10 it is something beyond the parts and the cause of their being one, namely, a form (^{a}23). And at 1084^{b}30, "whole" goes together with "one" and "form." That is why the identity of a city is determined by its constitution (form) rather than by its inhabitants (matter) (*Pol*. 1276^{b}6–9).

Why, the (*to dia ti*): The causal explanation of why something is the case.

Wildness (*agriotês*): The contrary of tameness (*hêmerotês*), but not a difference in animals (*PA* 643^{b}8). *Agrios* when used to characterize a sort of wild animal (*HA* 598^{b}1, 607^{a}5) means "savage."

Wind (*anemos, pneuma*): Wind and air are more "a this something and a form" than earth is (*GC* 318^{b}29–33): earth is cold (privation) and dry (privation), while air is hot (positive) and wet (positive) (330^{a}30–^{b}7). A wind, which is analogized to a river or spring, is even more a this something, since it is not just air in movement, but has a specific starting-point and a distinctive cause (*Mete*. 360^{a}31–33): like an animal, "a wind too has a sort of life and a coming to be and passing away" (*GA* 778^{a}2–3). This helps explain why Aristotle finds it natural to use *pneuma* for both: a wind is, as it were, the earth's breath. By the same token, wind (as we too call it) of the sort that results in farts and belches occurs in animals (*HA* 637^{a}31, *PA* 672^{a}32). See **Breath**

Wisdom, Practical (*phronêsis*): (1) *Phronêsis* (verb *phronein*) in the broad sense refers to thought or wisdom of a general sort (*Met.* 1009^{b}13, 30, F84). (2) In a narrower sense, it refers to the distinctively practical wisdom discussed in *NE* 6.5, 6.7–9, 6.12–13, which is the virtue or excellence of the rationally calculative or deliberative part of the soul, which ensures that we aim at and hit the best good—happiness. (3) Sometimes it is equivalent in meaning to *sophia* ("theoretical wisdom"), with which it is usually contrasted. Though (2) is a distinctively human possession, Aristotle does sometimes attribute a weaker form (*HA* 588^{a}18–^{b}3) of it to non-human animals (488^{b}15, 9.6, *PA* 648^{a}6, *GA* 753^{a}10–17). (4) Since practical wisdom is the same state of the soul as politics, though differing from it in being (*NE* 1141^{b}23–24), what is said about the latter is also relevant to it (*Pol*. 1277^{b}25–30). See **Politics**

Wisdom, Theoretical (*sophia*): "Scientific knowledge of certain sorts of starting-points and causes" (*Met*. 982^{a}2–3), namely, "the primary starting-points and causes" (982^{b}9–10), or "the starting-points and the highest causes" (1003^{a}26–27). It is virtue of the scientific part of the soul (*NE* 1144^{a}15), the best and most complete virtue (10.8), and the most exact form of scientific knowledge (1141^{a}16–17).

Wish (*boulêsis*): Wish seems to be the quintessential thought-involving desire (*NE* 1139^{b}5): "all wish is in the rationally calculative part" (*Top*. 126^{a}13; also *DA* 432^{b}5, *Rh*. 1369^{a}1); "when something is moved in accord with rational calculation, it is moved in accord with wish" (*DA* 433^{a}24–25). But at *Pol*. 1334^{b}22–25 and elsewhere we are told that "spirit and wish, and appetite besides, are present in children straight from birth, while rational calculation and understanding are made by nature to arise as they grow." When wish is contrasted with deliberate choice, however, the point of contrast is this: "there is no deliberate choice of impossible things, and if someone were to say he was deliberately choosing them, he would seem silly. But there is wish for impossible things—for example, immortality" (*NE* 1111^{b}22–23). And when wish is understood in this way there is nothing especially rational about it, which makes it easy to see why children are said to have it. The reason that wish has these two apparently inconsistent aspects lies in its definition as a desire that is "unconditionally and in truth . . . [for] the good" but in each individual for "the apparent good" (1113^{a}23–24). As a desire for the apparent good, then, wish *is* present in children straight from birth, but with proper habituation and training it can come to be for the real good, and so to be properly responsive to the deliberation that best furthers it, by having its "starting-point and cause" (*EE* 1226^{b}20–21) in it.

Woman (*gunê*)

The soul of a woman is different from that of a man: "A slave does not have the deliberative part of the soul at all; the female has it but it lacks control (*akuron*); a child has it but it is incomplete" (*Pol*. 1260^{a}12–14). As a result the works of a man and a woman "are divided, those of a man being different from those of a woman, so they assist each other by putting their special works into the common [household] enterprise" (*NE* 1162^{a}22–24). Household management is thus "of distinct sorts for a man and a woman; for his work is to acquire property and hers to preserve it" (*Pol*. 1277^{b}24–25). Since virtue and work go together, their virtues are divided too: "for each of the parties involved [in the household] there is a different virtue and a different work" (*NE* 1158^{b}17–18); "men have the courage of a ruler and women the courage of an assistant, and the same holds of the other virtues" (*Pol*. 1260^{a}23–24).

When it comes to what makes a woman's deliberative part lack control, however, matters are somewhat unclear. It might be, as *NE* 1150^{b}15–16 suggests, that women are congenitally lacking in self-control, so that they cannot control themselves, or that, as less spirited than men (*HA* 608^{a}33–^{b}12, *PA* 661^{b}32–33), they are unable to control others. A difficulty for both views is that sometimes women succeed in controlling cities (*NE* 1161^{a}1–3), and so themselves too to the requisite extent.

The term *akuron* ("lacks control") is tied to the notion of a decree: beliefs are *akuron*, "insofar as these are like decrees" (*NE* 1151^{b}15–16), where "a decree is doable in action, as the last thing" (1141^{b}27–28) reached in deliberation. Since one way a decree can be *akuron* is by being invalid, as a result of not being issued by the proper body, the one with the authority to make laws and issue decrees, what makes a woman's deliberative part lack control would seem to be that it lacks such authority. Since law is

"understanding without desire" (*Pol.* 1287ª32), and understanding is what grasps such starting-points as the practical good, or happiness, the implication is that a defect in women's understanding must be what explains the defect in their deliberative part. But just what Aristotle thinks that defect is, it is difficult to say with confidence.

Womb (*mêtra*): The term *mêtra*, which is sometimes synonymous with the more technical *hustera* ("uterus") (*HA* 632ª25), also sometimes refers to the mouth of the uterus and cervix (510ᵇ11) or to the interior womb (586ª28, ᵇ11).

Word: *Logos*

Work (*ergon*)
An *ergon* in the strict sense is the use or actualization of a state, capacity, or disposition, so that an activity can be an *ergon* (*Met.* 1050ª21–23). In this case the traditional translation is "function." An *ergon*, however, may also be the further result of a work in the strict sense (*NE* 1094ª5, *EE* 1219ª13–19). Here the traditional translation is "product." But this further result, though it may be a product (*GC* 329ª17, *Met.* 1015ª9), may also be another activity, as in the case of activity in accord with practical wisdom and the virtues of character, which, while intrinsically valuable, is also for the sake of theoretical wisdom and activity in accord with it (*NE* 1145ª8–9, 10.7–8). To capture these three features of *ergon* in a uniform way, it is translated as "work." For "work" can be a verb ("they work in bronze"), a noun applying to a craft product ("a work in bronze"), or an action ("by their works ye shall know them"). In a further sense an *ergon* is simply a fact (*Pol.* 1268ᵇ39).

A thing's work in the strict sense is identical to its end or final cause (*EE* 1219ª9) and is intimately related to its nature, form, and essence: a thing's nature is its for-the-sake-of-which (*Ph.* 194ª28–29), its form is more its nature than its matter (193ᵇ6–7), and its essence and form are the same (*Met.* 1032ᵇ1–2). Hence all things are "defined by their work" (*Mete.* 390ª10), with the result that if something cannot do its work it has no more than a name in common with its working self (*PA* 640ᵇ33–641ª5, *Met.* 1035ᵇ14–25 *Pol.* 1253ª20–25). And a thing's good or doing well "seems to lie in the work" (*NE* 1097ᵇ26–27), though this holds only when the thing itself is not already something bad (*Met.* 1051ª15–16). Moreover, if something "is naturally composed of several capacities, it is clear that, of the several things it can naturally accomplish, the best of them is always its work" (F90 42.15).

Works are thus attributed to a wide variety of things, whether living or nonliving. These include plants (*GA* 731ª24–26) and animals generally (*NE* 1176ª3–5), including divine celestial ones (*Cael.* 286ª8–11), parts of their bodies and souls (*PA* 652ᵇ11, 686ª29), instruments or tools of various sorts (*EE* 1242ª14–19), crafts, sciences (1219ª17), philosophies (*Met.* 1037ª15) and their practitioners (*NE* 1141ᵇ10), cities (*Pol.* 1326ª13), and nature itself (1258ª35).

Wretched (*athlios*): Though *athlios* often has no ethical connotations (as at *NE* 1150ᵇ5), sometimes it does, so that someone dies in a wretched way when, unlike Priam, he dies in a way that shows him to be a wretch—someone lacking in virtue (1100ᵇ33–1101ª14).

Writ (*graphê*): A *graphê* was a specific sort of legal action in Athenian law, of which the *graphê asebeias* ("writ of impiety") brought against Socrates in 399 BC and described at Plato *Apology* 24b–c is a well-known example. A legislative speaker in the Athenian assembly was liable to a writ of illegality (*graphê paranomôn*) if he proposed legislation that contravened already-existing law. MEASURES AND CURRENCY

Length

1 fingerbreadth (*daktulos*)	= 19.3 mm, 0.76 in.
4 fingerbreadths	= 1 palm (*palaistê*) (77.1 mm, 3.04 in.)
12 fingerbreadths	= 1 span (*spithamê*) (231.2 mm, 9.10 in.)
16 fingerbreadths	= 1 foot (*pous*) (308.2 mm, 12.13 in.)
24 fingerbreadths	= 1 cubit (*pêchus*) (462.3 mm, 18.20 in.)
96 fingerbreadths	= 1 fathom, rod (*orguia*) (1.85 m, 6.1 ft.)
1,600 fingerbreadths	= 1 plethron = 100 feet (30.8 m, 33.7 yd.)
9,600 fingerbreadths	= 1 stade (184.9 m, 202.2 yd.)

Volume

Liquid

1 ladle (*kuathos*)	= 45.5 ml, 0.39 fl. oz.
6 ladles	= 1 *cotyle* (272.8 ml, 9.22 fl. oz.)
6 *cotyles*	= 1 *maris* (plural: *mareis*)
12 *cotyles*	= 1 *chous* (plural: *choes*)
1 *chous*	= 3.37 L, 6.9 gal.
144 *cotyles*	= 1 *metretes* (plural: *metretae*) (39.3 L, 10.4 gal.)

Amphora (*amphoreus*): A unit of measurement roughly equal to 9 gal.

Dry

1 basket (*kophinos*)	≈ 7.6 L
192 *cotyles*	= 1 Attic medimnus (plural: medimni)
	≈ 52 L (a "bushel" or 60 lbs. in weight)

Weight

1 drachma	= 4.31 gm, 0.152 oz.
1 Attic talent	= 60 minas (26 kg, 58 lbs.)
	= 6,000 drachmas
	≈ 58 lb., 26 kg.

Currency

1 obol	= 0.17 drachmas
1 drachma	= 4.31 gm, 0.152 oz. of silver

ANNOTATED INDEX OF PEOPLE AND PLACES

(Line numbers are to the Greek texts and are approximate in the translations.)

Abdera: 470[b]28, 742[b]20. Major city on the Thracian coast.

Abydus: 1305[b]32, 1306[a]31. City on the Asiatic coast of the Hellespont.

Acarnania: F210. Area in west-central Greece.

Acastus: *Ath*. 3.3. The second of the life archons after Medon.

Acastus: F222. Greek hero.

Achaea, Achaeans: 343[b]2, 366[a]26, 368[b]6, 1269[b]6, 1303[a]29, 1338[b]22. Region in the north-central part of the Peloponnese.

Achelous: 350[b]15, 352[a]35, 420[b]12, 535[b]18, 579[b]7, 606[b]15. River in western Greece.

Acherdus: *Ath*. 38.3. A deme of Athens.

Achilles: 97[b]18, 117[b]15, 24, 166[a]38, 239[b]14, 24, 548[b]1, 618[b]27, 1071[a]22, 1230[a]21, 1359[a]3, 1363[a]19, 1378[b]32, 1396[a]25, [b]12, 15, 1397[b]22, 1401[b]18, 1406[b]24, 1416[b]27, 1418[a]35. Greatest of the Greek heroes at Troy who, unlike the other Greek leaders, had not sworn to defend Menelaus' right to Helen (referred to at 1396[b]14–18).

Acropolis: 1400[a]32, *Ath*. 24.3

Acte: *Ath*. 42.3, 61.1. Peninsula south of Piraeus.

Adamas: 1311[b]22. Killer of Cotys.

Adrastus of Aphrodisias: F150. 2nd-cent BC Peripatetic philosopher.

Adriatic: 558[b]16, 598[b]16, 18, 749[b]29

Aeacus: 1418[a]36. Grandfather of Achilles.

Aedepsus: 366[a]29. City in Euboea.

Aegean Sea: 354[a]14, 598[a]26, [b]30, 1393[b]1

Aegeus: 1461[b]21. Archaic figure in the founding myth of Athens.

Aegina: 1015[a]25, 1025[a]25, 1291[b]24, 1306[a]4, 1396[a]19, 1411[a]14. Island in the Saronic Gulf.

Aegisthus: 1453[a]37. Lover of Clytemnestra, killed by Orestes.

Aegon: 350[b]11. Unidentified river.

Aegospotami: 344[b]32, *Ath*. 34.2. On the Hellespont.

Aenesidemus: 1373[a]22. Father of Theron, tyrant of Acragas (c. 489–473 BC).

Aenus: 1311[b]21. Town in Thrace on the trade route between the Black Sea and the Aegean.

Aeolian Islands: 367[a]3.

Aeschines: 1417[b]1. 4th-cent BC teacher of oratory.

Aeschylus: 633[a]18, 1111[a]10, 1388[a]7, 1449[a]16, 1456[a]17, 1458[b]20, 1458[b]22. 5th-cent BC Athenian tragic poet.

Aeschylus: 342[b]36, 343[a]27. Associate of Hippocrates of Chios.

Aesion: 1411^{a}25. Athenian orator.

Aesop: 356^{b}11, 663^{a}35, 1393^{a}30, 1393^{b}9, 23. Supposed author of fables.

Aetolia: F108, F210. Area north of the Gulf of Corinth.

Agamemnon: 166^{b}6, 1161^{a}14, 1285^{a}11, 1287^{b}14. Leader of the Greeks at Troy.

Agathon: 1139^{b}9, 1140^{a}19, 1230^{a}2, 1232^{b}8, 1392^{b}7, 1402^{a}9, 1451^{b}21, 1456^{a}18, 24, 30. Athenian tragic poet of the late 5th cent BC.

Agesilaus II: 1306^{b}35. Eurypontid king of Sparta (c. 400–360 BC).

Agesipolis: 1398^{b}32. King of Sparta (c. 394 BC).

Agyrrhius: *Ath*. 41.3

Ahura Mazda (Oromasdes): F19. Zoroastrian god.

Ajax: 97^{b}18, 117^{b}13, 24, 1456^{a}1. Greek hero at Troy.

Ajax of Theodectes: 1399^{b}28, 1400^{a}27, 28

Alcaeus: 1285^{a}37, 1367^{a}9. Lyric poet from Mytilene in Lesbos (born c. 620 BC).

Alcibiades: 97^{b}18, 578^{b}28, 1300^{b}29, 1390^{b}29, 1451^{b}11, F88. Athenian general and statesman (452–404 BC).

Alcidamas: 1373^{b}18, 1398^{b}10, 1406^{a}1, 9, 18, ^{b}11. 4th-cent BC rhetorician and student of the sophist Gorgias.

Alcinous: 1317^{a}13, 1455^{a}2. In Homer, the ruler of the Phaeacians.

Alcmaeon: *Ath*. 13.4

Alcmaeon of Croton: 405^{a}29, 492^{a}14, 581^{a}16, 752^{b}25, 986^{a}27, 1110^{a}28, 1397^{b}3. 5th-cent BC author.

Alcmaeonids: *Ath*. 19.3, 28.2. Prominent Athenian family.

Alcman: 557^{a}2. Choral poet from Sparta (fl. 7th cent BC).

Alcmeon of Theodectes: 1397^{b}3

Alcyione: 1274^{a}35

Alexamena of Styra: F106. Early writer of dialogs.

Alexander of Aphrodisias: F7, F58, F59, F145, F191. 2nd- and 3rd-cent AD Aristotelian commentator.

Alexander of Molossia: F218. King of Epirus (c. 370–331 BC).

Alexander the Great: F99

Alexias: *Ath*. 34.2

Alope of Carcinus: 1150^{b}10

Alopeconnesus: 598^{a}22. City on the western coast of Thrace.

Alphesiboa: 1397^{b}5. Character in Theodectes' Alcmeon.

Amadocus I: 1312^{a}14. Thracian king of the Odrysae (a union of Thracian tribes).

Amasis: 1259^{b}8, 1386^{a}19. King of the Egyptians (596–525 BC).

Ambracia: 1303^{a}23, 1304^{a}31, 1311^{a}40, *Ath*. 17.4. Colony of Corinth in northwest Greece.

Amisus: 554^{b}15. City on the coast of Asia Minor.

Ammon: 352^{b}32

Ammonos: *Ath*. 61.7. Trireme kept in reserve at the Piraeus for state purposes.

Amphiaraus: 1389^{a}16, 1455^{a}27. Early Greek hero.

Amphipolis: 1303^{b}2, 1306^{a}2. City on the river Strymon in Macedonia.

Amphyctyons: F219, F222. Political and religious organization of cities.

Amphytaeans: 1319^{a}14. Inhabitants of Amphytis, a small city on the northeast coast of Pallene in Chalcidice.

Amyntas: 1311^{b}14. Son of Archelaus II of Macedon.

Amyntas the Little: 1311^{b}3. Otherwise unknown.

Anacharsis: 78^{b}30, 1176^{b}33. Largely legendary Scythian prince.

Anacreon: *Ath*. 18.1. Lyric poet from Teos (c. 575–c. 495 bc).

Anaxagoras of Clazomenae: 187^{a}22, 26, 189^{a}17, 203^{a}20, 205^{b}1, 213^{a}24, 250^{b}24, 252^{a}10, 256^{b}24, 265^{b}22, 270^{b}24, 294^{b}14, 301^{a}11, 302^{a}31, ^{b}14, 309^{a}19, 314^{a}13, 17, 25, 339^{b}22, 342^{b}27, 345^{a}25, 348^{b}12, 365^{a}17, 19, 369^{b}14, 404^{a}25, ^{b}1, 405^{a}13, 405^{b}19, 429^{a}19, ^{b}24, 470^{b}30, 33, 677^{a}5, 687^{a}8, 723^{a}7, 756^{b}16, 763^{b}31, 984^{a}11, ^{b}18, 985^{a}18, 988^{a}17, 28, 989^{a}30, 991^{a}16, 1007^{b}25, 1009^{a}27, ^{b}26, 1012^{a}26, 1056^{b}28, 1063^{b}25, 1069^{b}21, 1072^{a}5, 1075^{b}8, 1079^{b}20, 1091^{b}11, 1141^{b}3, 1179^{a}13, 1215^{b}6, 1216^{a}11, 1398^{b}15. Presocratic philosopher (c. 500–c. 428 bc).

Anaxandrides: 1152^{a}22, 1411^{a}18, 1412^{b}16, 1413^{b}25. 4th-cent bc comic poet from Camirus in Rhodes.

Anaxilaus: 1316^{a}38. Tyrant of Rhegium (494–476 bc).

Anaximander: 187^{a}21, 203^{b}14, 295^{b}12, 1069^{b}22. Presocratic philosopher from Miletus (died soon after 547 bc).

Anaximenes: 294^{b}13, 365^{a}18, ^{b}6, 984^{a}5. Presocratic philosopher from Miletus (fl. 546–525 bc).

Anchimolus: *Ath*. 19.5.

Androcles of Pitthus: 1400^{a}9. Prominent popular leader in Athens in the latter part of the 5th cent bc.

Androdamus of Rhegium: 1274^{b}23. Otherwise unknown.

Andromache: 1239^{a}36. In Antiphon's *Andromache*.

Andros, Andrians: 1270^{b}12. The northmost of Cyclades, about six miles southeast of Euboea.

Androtion: 1406^{b}27. Athenian politician (c. 410–340 bc), who studied under Isocrates.

Angra Mainyu (Areimanius): F19. Zoroastrian god.

Antandria: 519^{a}16. City in the Troad region of Anatolia.

Anthemion: *Ath*. 7.4. Perhaps the father of Anytus.

Antheus of Agathon: 1451^{b}21. Lost.

Antidosis of Isocrates: 1418^{b}28

Antidotus: *Ath*. 26.4

Antigone: 1373^{b}9, 1375^{a}34, 1417^{a}29, 1418^{b}32. Daughter of Oedipus.

Antigone of Sophocles: 1415^{b}19, 1417^{a}28, 1454^{a}1

Antileon: 1316^{a}32. Tyrant of Chalcis, but otherwise unknown.

Antilochus of Lemnos: F109. Purported rival of Socrates.

Antimachus: 1408^{a}1. Poet and scholar from Colophon (fl. 400 bc).

Antimenides: 1285^{a}36. Brother of Alcaeus.

Antipater: F233, F234, F235, F236, F237. Macedonian statesman and general.

Antipheron of Oreus: 451^{a}9. Otherwise unknown.

Antiphon: 1239^{a}37, 1379^{b}15, 1385^{a}9, 1399^{b}25. 4th-cent BC tragic poet from Syracuse.

Antiphon of Rhamnus: 172^{a}7, 185^{a}17, 193^{a}12, 1232^{b}8, *Ath*. 32.2. 5th-cent BC Athenian politician and orator.

Antiphon the Soothsayer: F109. Purported rival of Socrates, possibly Antiphon of Rhamnus.

Antissa, Antissaeans: 1303^{a}34. Aeolians from the north coast of Lesbos.

Antisthenes: 104^{b}21, 1024^{b}32, 1043^{b}24, 1284^{a}15, 1407^{a}9. Philosopher, follower of Socrates (445–365 BC).

Anytus: *Ath*. 27.5, 34.3. Late-5th-cent BC politician. An accuser of Socrates in 399 BC.

Aparctias Wind: 363^{b}14

Apeliotes Wind: 363^{b}13

Apelles: F103. 4th-cent BC painter.

Aphidna: *Ath*. 34.3

Aphrodite: 406^{b}19, 1149^{b}15, 1269^{b}29, 1400^{b}22, 1413^{a}34. The goddess of sexual love.

Apis: 1216^{a}1. Egyptian god.

Apollo: 1380^{b}28, 1398^{b}33, *Ath*. f1, 55.3, F15, F105. Greek god.

Apollodorus of Lemnos: 1259^{a}1. A contemporary of Aristotle's who wrote on practical farming.

Apollonia, Apolloniates: 511^{b}30, 1303^{a}36, 1306^{a}9. City on the Black Sea.

Apollonia: 511^{b}30, 1290^{b}11. City on the Ionian Gulf.

Arabia: 349^{a}5, 494^{b}8, 498^{b}9, 499^{a}15, 546^{b}3, 606^{b}5

Arachotae: 499^{a}4. Now Baluchistan.

Araxes River: 350^{a}24. Perhaps the Syr Darya.

Arcadia, Arcadians: 351^{a}3, 388^{b}6, 617^{a}14, 647^{a}14, 1261^{a}29, 1269^{b}4, 1270^{a}3, F211, F222. Highland region at the center of the Peloponnese.

Arcesius: F210. Greek hero and grandfather of Odysseus.

Archagoras: F96

Archelaus: 1311^{b}8, 30, 1398^{a}25. King of Macedon (c. 413–399 BC).

Archemorus: F222. Mythical son of Lycurgus.

Archestratus: *Ath*. 35.2. Identity unknown.

Archias: 1306^{b}1. Tyrant of Thebes c. 379 BC.

Archibius: 1376^{a}10. Otherwise unknown.

Archidamus: 1406^{b}30. Otherwise unknown.

Archilochus: 1328^{a}3, 1398^{b}12, 1418^{b}27. 7th-cent BC poet from the island of Paros.

Archinus: *Ath*. 17.4, 34.3, 40.1–2. Democratic leader.

Archytas of Tarentum: 1043^{a}21, 1340^{b}26, 1412^{a}12. Pythagorean mathematician and philosopher (fl. c. 400–350 BC).

Heracleid: 1451a20

Heracleides of Aenus: 1311b21. Co-killer of Cotys. Otherwise of uncertain identity.

Heracleides of Clazomenae: *Ath*. 41.3

Heracleodorus: 1303a19. 4th-cent bc democratic leader in Oreus.

Heracleotic: 525b5, 527b12, 684a8, 10

Heracles: 359a28, 585a14, b22, 1058a24, 1213a13, 1245a30, b30, 1284a23, 1451a22, F198, F222, F242. Greek hero.

Heraclides of Pontus: F59. 4th-cent bc Platonist philosopher.

Heraclitus of Ephesus: 104^{b}22, 159^{b}31, 185^{a}7, ^{b}20, 205^{a}3, 279^{b}15, 298^{b}30, 355^{a}14, 405^{a}25, 645^{a}17, 984^{a}7, 987^{a}33, 1005^{b}25, 1010^{a}13, 1012^{a}24, 34, 1062^{a}32, 1063^{b}24, 1078^{b}14, 1105^{a}8, 1146^{b}30, 1155^{b}4, 1176^{a}6, 1201^{b}8, 1223^{b}22, 1235^{a}25, 1315^{a}30, 1407^{b}14. Presocratic philosopher (fl. c. 500 BC).

Heraea: 1303^{a}15. City in western Arcadia in the Peloponnese.

Hercynian Mountains: 350^{b}5. The central massive from the Alps to the Carpathian mountains.

Hermes: 190^{b}7, 1002^{a}22, 1017^{b}7, 1048^{a}33, 1050^{a}20, 1116^{b}18, 1401^{a}20, 21. Messenger of the gods and god of good luck.

Hermias: F223, F233. Greek tyrant and friend of Aristotle.

Hermocreon: *Ath.* 22.2

Hermotimus of Clazomenae: 984^{b}19. A somewhat legendary figure.

Herodicus: 1243^{b}22, 1361^{b}5, 1400^{b}19. Physical trainer.

Herodorus of Heraclea: 563^{a}7, 615^{a}9, 659^{a}20, 757^{a}5. Father of Bryson; author of mythological works.

Herodotus of Halicarnassus: 523^{a}17, 736^{a}10, 756^{b}6, 1236^{b}9, 1407^{a}39, 1409^{a}28, 1417^{a}7, 1451^{b}2, *Ath.* 14.4, F213. Historian (484–425 BC).

Herpyllis: F243

Hesiod: 208^{b}30, 298^{b}28, 601^{b}1, 984^{b}23, 989^{a}10, 1000^{a}9, 1095^{b}9, 1132^{b}27, 1153^{b}27, 1164^{a}27, 1252^{b}10, 1312^{b}4, 1381^{b}17, 1388^{a}17. One of the oldest known Greek poets (c. 700 BC).

Hesione: 1416^{b}2. Sister of Priam.

Hestia: 369^{a}32. Goddess of the hearth.

Hestiaea: *See* Oreus

Hestiaeus: F59. 4th-cent BC Platonist philosopher.

Hiera: 367^{a}2. Island off the northern coast of Sicily.

Hiero: 1312^{b}11, 1313^{b}14, 1315^{b}34, 37, 1391^{a}9. Brother and successor of Gelon.

Hieronymus: F105, F133. Probably the 3rd-cent BC Peripatetic philosopher.

Himera: 1393^{b}10. City in Sicily.

Hipparchus: 1401^{b}12, *Ath.* 17.3, 18.3, 19.2. Younger son of Pisistratus, killed by Harmodius and Aristogeiton.

Hipparchus: F243. Member of the Lyceum.

Hipparchus Son of Charmus: *Ath.* 22.4. Probably Charmus was married to a daughter of Hippias.

Hipparinus: 1306^{a}1. Syracusan general whose daughter Aristomache was married to Dionysius I.

Hippasus of Metapontium: 984^{a}7. Early Pythagorean.

Hippias: 1356^{b}34, *Ath.* 17.3, 18–19. Tyrant of Athens, son of Pisistratus, brother of Hipparchus.

Hippias of Thasos: 1461^{a}22. Grammarian. Perhaps the man of that name who died in Athens in 404 BC.

Hippo: 405^{b}4, 984^{a}3. Eclectic philosopher (c. 495–428 BC).

Hippocentaur: F174

Hippocrates of Cos: 1326^{a}15. Famous 5th-cent BC doctor.

Hippocrates of Chios: 171^{b}15, 342^{b}36, 344^{b}15, 1247^{a}17. 5th-cent BC mathematician, anticipator of Euclid.

Hippodamus of Miletus: 1267^{b}22, 1268^{a}15, 1330^{b}24

Hippolochus: 1368^{a}17. Otherwise unknown.

Hippomenes: *Ath.* f5

Homer: 157^{a}15, 166^{b}3, 171^{a}10, 222^{a}1, 23, 351^{b}35, 404^{a}29, 427^{a}25, 513^{b}26, 519^{a}19, 574^{b}33, 575^{b}4, 578^{b}1, 606^{a}19, 615^{b}9, 618^{b}25, 629^{b}22, 673^{a}15, 679^{b}34, 699^{b}35, 785^{a}15, 1009^{b}28, 1076^{a}4, 1109^{a}31, ^{b}10, 1113^{a}8, 1116^{a}21, ^{b}27, 1118^{b}11, 1136^{b}9, 1141^{a}14, 1145^{a}20, 1149^{b}17, 1160^{b}26, 1161^{a}14, 1180^{a}28, 1191^{a}8, 1230^{a}20, 1234^{a}2, 1252^{b}22, 1253^{a}5, ^{b}36, 1259^{b}13, 1267^{a}1, 1278^{a}37, 1285^{a}10, 1287^{b}14, 1292^{a}13, 1338^{a}24, 1362^{b}35, 1363^{a}6, 19, 1365^{a}11, 30, 1370^{b}5, 11, 28, 1375^{b}30, 1378^{b}5, 33, 1379^{a}4, 1380^{b}23, 29, 1387^{a}34, 1395^{a}13, 15, 1398^{b}12, 1406^{b}21, 1410^{a}29, 1411^{b}31, 1412^{a}2, 7, 1413^{a}31, 1414^{a}2, 1415^{a}16, ^{b}26, 1417^{b}4, 1418^{a}8, 1447^{b}18, 1448^{a}11, 22, ^{b}28, 34, 1451^{a}23, 1459^{a}31, ^{b}12, 1460^{a}5, 19, F29, F99, F100, F105, F110, F135, F164

Homer Scholars: 1093^{a}27

Human: Boxing champion in the Olympic Games of 456 BC.

Hygiaenon: 1416^{a}29. Otherwise unknown.

Hymettus, Mount: *Ath.* 16.6. Near Athens.

Hypanis River: 552^{b}18

Hyperboreans: 580^{a}18

Hypsichides: *Ath.* 22.8

Hyrcanian Sea (Atlantic): 354^{a}3

Iapygia: 1303^{a}5, 1329^{b}20. The heel of the Italian peninsula.

Iberia, Iberians: 748^{a}26, 1224^{b}19

Icadius: 1461^{b}8

Icarius: 1461^{b}8

Ida, Mount: 1401^{b}22, F30

Idreus: 1406^{b}28. *See* Androtion

Iliad: 1030^{a}9, ^{b}9, 1045^{a}13

Illyria, Illyrians: 499^{b}12, 606^{b}3, 1461^{a}4. Region in the Balkan Peninsula.

Imbros: *Ath.* 62.2. Island in the north-northeastern Aegean; now part of Turkey.

Inachus River: 350^{b}16. In Argos.

India(n): 116^{a}38, 167^{a}8, 298^{a}12, 362^{b}21, 28, 499^{b}18, 501^{a}26, 571^{b}33, 597^{b}28, 606^{a}8, 607^{a}4, 34, 610^{a}19, 643^{b}6, 663^{a}19, 23, 746^{a}34, 1189^{a}20, 1226^{a}31, 1332^{b}24, F65

Indus River: 350^{a}26

Iolcus: F222. City in Thessaly.

Ion: 1024^{a}34, *Ath.* f1, 3.2. Legendary Athenian polemarch.

Ionia(n): 1024^{a}33, 1290^{b}11, 1329^{b}20, 1310^{b}28

Iophon: *Ath.* 17.3

Iphiades: 1306^{a}31. Otherwise unknown.

Iphicles: 585^{a}14. Fathered by Amphitryon one night earlier than his twin half-brother Heracles, who was fathered by Zeus.

Iphicrates: 1365^{a}28, 1367^{b}18, 1394^{a}23, 1397^{b}30, 1398^{a}5, 8, 17, 1399^{a}33, 1405^{a}20, 1411^{a}10, 1416^{a}10. Distinguished Athenian general (c. 415–353 BC).

Iphigenia: 1452^{b}6, 1454^{a}32, Daughter of Agamemnon and Clytemnestra.

Iphigenia in Aulis of Euripides: 1454^{a}7, 32, ^{b}32, 1455^{a}7, 18, ^{b}3

Isocrates: 1368^{a}20, 1392^{b}11, 1399^{a}2, 4, ^{b}10, 1408^{b}15, 1409^{b}33, 1410^{a}1, ^{b}29, 1411^{a}30, ^{b}28, 1412^{b}5, 1414^{b}27, 33, 1418^{a}33, ^{b}27. Athenian orator and educator (436–338 BC).

Ister: 350^{b}2, 356^{a}28, 597^{a}11, 598^{b}16. Now the Danube.

Isthmian Games: 1406^{a}21, 22, F222

Isthmus: F14. City on the island of Cos.

Istrus: 1305^{b}5, 11. City on the Black Sea.

Italus: 1329^{b}8, 10, 14

Italy, Italians: 367^{a}7, 607^{a}26, 632^{b}25, 987^{a}10, 31, 988^{a}26, 1274^{a}24, 1329^{b}7, 11

Ithaca: 606^{a}2, F214. Island in the Ionian Sea; now Corfu.

Ixion: 284^{a}35, 1456^{a}1. Thessalian king condemned to eternal punishment on a fiery wheel.

Jason the Thessalian: 1277^{a}24, 1373^{a}26, 1400^{b}13. Tyrant (c. 380–370 BC).

Jocasta: 1417^{b}18. Wife of Oedipus.

Jupiter: 343^{b}30, 1073^{b}35, 1074^{a}7

Kouretes: F210. Legendary tribe in Acarnania.

Kylon: F109. Purported rival of Pythagoras.

Laconia: 574^{a}17, 608^{a}27, 781^{b}10. Region in the southeastern part of the Peloponnese.

Laius: 1460^{a}30. Father of Oedipus.

Lametius: 1329^{b}13

Lampetia: F164. Daughter of Helios and personification of light.

Lampon: 1419^{a}2. Prophet mentioned in Aristophanes.

Lampsacus: 1398^{b}15. City on the eastern side of the Hellespont.

Larissa: 1275^{b}29, 1305^{b}19, 1306^{a}29, 1311^{b}17. Principal city of Thessaly.

Law: 1398^{b}6. Speech of Theodectes.

Lebadia: 606^{a}1

Lectum: 547^{a}5. Now Cape Baba; the westernmost point of Asia Minor.

Leda: F242. Legendary mother of Helen of Troy, Clytemnestra, Castor, and Pollux.

Leimone: *Ath*. f5

Leleges: F210. Pre-Greek inhabitants of the Aegean.

Lemnos: 522^{a}13, 18, *Ath*. 61.6, 62.2. Island in the northern Aegean.

Lenaean: *Ath*. 57.1. Festival of Dionysus.

Leodamas: 1364^{a}19, 1400^{a}31. 4th-cent BC statesman and orator from Acharnae.

Leontini: 520^{b}1, 1275^{b}27, 1310^{b}29, 1316^{a}36. City in Sicily.

Leophanes: 765^{a}25. Scientist and naturalist (in or before 4th cent BC).

Leptines: 1411^{a}4. Athenian orator.

Lesbos, Lesbian: 621^{b}22, 763^{b}1, 1137^{b}30, 1284^{a}40, *Ath*. 24.2. Island in the northeastern Aegean.

Leto: 580^{a}17, 1414^{a}3. Mother of Apollo.

Leucas: 1266^{b}22, F210. Corinthian colony founded in the 7th cent BC.

Leucippus: 213^{a}34, 275^{b}30, 300^{b}8, 303^{a}4, 12, 18, 315^{b}6, 29, 325^{a}1, 23, ^{b}6, 11, 26, 404^{a}5, 985^{b}4, 1071^{b}32, 1072^{a}7, 1084^{b}27. Atomist philosopher; teacher of Democritus.

Leucothea: 1400^{b}5. Originally Ino, she was transformed into a sea goddess.

Libation Bearers of Aeschylus: 1455^{a}4

Libya: 350^{b}10, 352^{b}32, 358^{b}3, 363^{a}5, 606^{a}6, 18, ^{b}9, 14, 19, 20, 607^{a}22, 615^{b}4, 616^{b}5, 655^{a}9, 658^{a}13, 695^{a}17, 697^{b}14, 746^{b}7, 8, 749^{b}17, 1010^{b}11, 1262^{a}20, 1393^{a}30, F65

Licymnius of Chios: 1405^{b}5, 1413^{b}13, 1414^{b}17. Dithyrambic poet and rhetorician.

Liguria(ns): 351^{a}16, 368^{b}32, 493^{b}15

Lipara: 367^{a}6. Island off the northern coast of Sicily.

Lips Wind: 363^{b}19

Lipsydrium: *Ath*. 19.3

Little Iliad: 1459^{b}2, 5

Locris: 1266^{b}19, 1274^{a}22, 27, 1307^{a}38, 1395^{a}1, F210. Greek settlement in southern Italy.

Lycaon: F222. Mythical king of Arcadia.

Lyceum: 219^{b}21, 1385^{a}28, F96. Aristotle's school.

Lycia: 548^{b}20, 606^{a}17. Region in Anatolia.

Lycoleon: 1411^{b}6. Orator.

Lycomedes: *Ath*. f4

Lycophron: 174^{b}32, 185^{b}28, 1045^{b}10, 1280^{b}10, 1405^{b}35, 1406^{a}7, 1410^{a}17, F125. Apparently, a follower or imitator of Gorgias. Known only from Aristotle.

Lyctians: 1271^{b}28. Inhabitants of the city of Lyctus in Crete.

Lycurgus: 1270^{a}7, 1271^{b}25, 1273^{b}33, 1274^{a}29, 1296^{a}20, 1398^{b}17. The (perhaps legendary) architect of the Spartan constitution.

Lycurgus: *Ath*. 13.4, 14.3, 28.2

Lydia, Lydians: 617^{b}19, 1290^{b}17, F110. Present-day Anatolia.

Lygdamis of Naxos: 1305^{a}41, *Ath*. 15.2–3. Tyrant (c. 545–524 BC).

Lynceus: 328^{a}15, F88, F90. Mythical prince gifted with superhuman sight.

Lynceus of Theodectes: 1452^{a}27, 1455^{b}29

Lyncus: 359^{b}17. City in Macedonia.

Lysander: 97^{b}21, 176^{b}5, 1301^{b}19, 1306^{b}33, *Ath*. 34.2–3. Spartan general.

Lysicrates: *Ath*. 26.3

Lysimachus: *Ath*. 45.1. Otherwise unknown.

Macedonia: 596^{a}4, 7, 1310^{b}39, 1324^{b}15, F67

Maeander: 1289^{b}40. River in present-day Turkey.

Maedica: 500^{a}2, 630^{a}19. On the border of Thrace.

Maeotis, Lake: 350^{a}25, 353^{a}1, 362^{b}22, 620^{b}6. Sea of Azov.

Maeotis River: 354^{a}13

Magi: 1091^{b}10, F19, F63, F64, F65, F66. Hereditary caste of Zoroastrian priests.

Magnes: 1448^{a}34. Major early comic poet in Athens.

Magnesia: 1269^{b}7, 1289^{b}39. City in present-day Turkey.

Malea, Cape: 548^{b}25. In the southeast Peloponnese.

Malia: 1297^{b}14. City on the north coast of Crete.

Mandrobulus: 174^{b}27. Perhaps that of Xenocrates.

Mantias: 1398^{b}1. Orator.

Mantinaea, Battle of: 1304^{a}26, 1318^{b}25, 27

Marathon: 569^{b}12, 1396^{a}13, *Ath*. 22.3. Area in the northeast of Attica. Site of the famous battle against the Persians in 490 bc.

Margites: 1141^{a}14, 1448^{b}30, 38. Lost burlesque by Homer.

Marmora, Sea of: 598^{a}25, ^{b}28

Maroneia: *Ath*. 22.7. In eastern Attica near Athens.

Massalia: 1305^{b}4, 1321^{a}30, F216. Present-day Marseilles.

Medea: 1453^{b}29. Wife of Jason.

Medea of Carcinus: 1400^{b}10, 11

Medea of Euripides: 1454^{b}1

Medes: 1284^{b}2, 1339^{a}35

Media(n): 522^{b}26, 552^{b}9, 595^{b}28, 627^{b}17. Ancient country in what is now northwestern Iran.

Medius: 618^{b}14. Of Larissa.

Medon: *Ath*. 3.1. The first of the life archons.

Medusa: F166

Megacles (of Mytilene): 1311^{b}25

Megacles, Son of Hippocrates: *Ath*. f6, 13.4, 14.3–4, 15.1, 22.5. Leading member of the Alcmaeonid family.

Megalopolis: F211. City in Arcadia.

Megara, Megarians: 1008^{b}14, 1123^{a}24, 1236^{a}38, 1242^{b}25, 1280^{b}14, 1300^{a}17, 1302^{b}31, 1304^{b}35, 1305^{a}24, 1357^{b}33, 1448^{a}31, *Ath*. 14.1, 17.2, F210. City on the Isthmus of Corinth.

Megarians: 1046^{b}29. School of philosophers founded by Euclides of Megara.

Melanippe: 1454^{a}31

Melanippides: 1409^{b}27. Dithyrambic poet from Melos (second half of 5th cent bc).

Melanopus: 1374^{b}25. Athenian ambassador to Thebes in 370/1 bc with Callistratus, and his rival.

Meleager: 1365^{a}12, 1453^{a}20

Meleager of Antiphon: 1379^{b}15, 1399^{b}25, 27

Meletus: 1419^{a}8. Prosecutor of Socrates in 399 bc.

Melissus of Samos: 104^{b}22, 167^{b}13, 168^{b}35, 181^{a}27, 184^{b}16, 185^{a}9, ^{b}17, 186^{a}6, 207^{a}15, 213^{b}12, 214^{a}27, 298^{b}17, 986^{b}19, F22. Follower of Parmenides (5th cent bc).

Melite: 612^{b}10. Island off the Dalmatia, now Meleda.

Melobius: *Ath*. 29.1. Possibly one of the Thirty Tyrants.

Memphis: 352^{a}1. City in Egypt.

Menelaus: 1454^{a}29, 1461^{b}21. Brother of Agamemnon; husband of Helen.

Meno: F206. Doctor and student of Aristotle.

Mentor: 1197^{b}22. Perhaps Mentor of Rhodes, instrumental in the death of Hermias, tyrant of Atarneus.

Mercury: 432^{b}33, 1073^{b}31, F189

Merope: 1111^{a}12, 1454^{a}5. Supposed mother of Oedipus.

Meses Wind: 363^{b}34

Messapium, Mount: 630^{a}19

Messenia, Messanians: 1269^{b}4, 1270^{a}3, 1306^{b}38, 1397^{a}10, 1418^{b}10. Region in the southwestern Peloponnese.

Messianicus: 1373^{b}18, 1397^{a}11. Oration by Alcidamas.

Metapontium: 1229^{a}24, F176. City on the gulf of Tarentum.

Metrodorus: F143. Epicurean philosopher (c. 331–278 BC).

Miccalus: 47^{b}30.

Midas: 1257^{b}16, F75. Mythical Phrygian king.

Miletus, Milesians: 605^{b}26, 1151^{a}9, 1259^{a}6, 1267^{b}22, 1298^{a}13, 1305^{a}17. City on the western coast of Anatolia, in modern-day Turkey.

Milo: 1106^{b}3. A famous wrestler from Croton (late 6th cent BC).

Miltiades: 1411^{a}10, *Ath*. 28.2. Athenian general (550–489 BC).

Minos: 1271^{b}31, 38, 1329^{b}4, 6, 25, F212. Semi-mythical Cretan king.

Mithridates: 1312^{a}16

Mitys: 1452^{a}8. Of Argos.

Mixidemides: 1398^{b}25, 27. Otherwise unknown.

Mnaseas: 1304^{a}11

Mnasilochus: *Ath*. 33.1

Mnasitheus of Opus: 1462^{a}7. Otherwise unknown.

Polycrates: 1313^{b}24. Tyrant of Samos c. 535–522 BC.

Polycrates: 1401^{a}34, ^{b}15. 4th-cent BC rhetorician.

Polydamas: 1116^{a}23, 1191^{a}9, 1230^{a}21. Trojan hero.

Polyeuctus: 1411^{a}21. Athenian orator.

Polygnotus: 1340^{a}37, 1448^{a}5, 1450^{a}27. Painter from Thasos (c. 500–c. 440 BC).

Polyidus: 1455^{a}6. Sophist. Otherwise unknown.

Polyneices: 1373^{b}10. Brother of Antigone.

Polyphemus: F167. Cyclops and son of Poseidon.

Polyxenus: F174. Sophist.

Polyzelus: F96

Pontus: 347^{a}36, ^{b}4, 348^{b}34, 367^{a}1, 554^{b}8, 18, 596^{b}31, 600^{b}13, 605^{a}21, 606^{a}10, 20, 632^{b}9. City on the Black Sea.

Pordoselene: 605^{b}29. Island near Lesbos.

Porphyry of Tyre: F15, 59. 3rd-cent AD Platonist philosopher.

Poseidon: 1455^{b}18, F166. God of the sea.

Potidaea: 1396^{a}20. Colony of Corinth founded in 600 BC in northern Greece.

Pratys: 1413^{a}7, 9. Rhapsode. Otherwise unknown.

Priam: 618^{b}27, 1100^{a}8, 1101^{a}8, 1145^{a}21, 1362^{b}36, 1363^{a}6, 1414^{b}38, 1416^{b}1, 3. King of Troy.

Proclus of Athens: F79. Platonist philosopher (c. 412–485 AD).

Prodicus: 1243^{b}22. Perhaps the Hippocratic doctor from Selymbria.

Prodicus of Ceos: 112^{b}22, 1415^{b}15. 5th-cent BC teacher of rhetoric.

Prometheus: 1456^{a}2

Protagoras of Abdera: 173^{b}19, 998^{a}3, 1007^{b}22, 1009^{a}6, 1047^{a}6, 1053^{a}35, 1062^{b}13, 1164^{a}24, 1402^{a}25, 1407^{b}6, 1456^{b}15, F92, F96, F163. Sophist (c. 490–c. 420 BC).

Protarchus: 197^{b}10. Orator and pupil of Gorgias.

Protos: F216

Proxenus: F243. Nicanor's father. Arimneste, Aristotle's sister, may have been his mother.

Prytanis: F133. Probably the Peripatetic philosopher (1st cent BC).

Psammeticus: 1315^{b}26. Tyrant of Corinth.

Psychrus River: 519^{a}14. East of Pontus.

Pygmies: 596^{b}6

Pylos: *Ath.* 27.5, In the Peloponnese.

Pyramids of Egypt: 1313^{b}21

Pyrene: 350^{b}1. The Pyrenees.

Pyrrha: 544^{a}22, 548^{a}9, 603^{a}21, 621^{b}12, 680^{b}1, 763^{b}1, F243. Town on Lesbos.

Pyrrha: 1024^{a}37. Wife of Deucalion.

Pyrrhus, King: 522^{b}24, 595^{b}18. Probably the son of Achilles, also called "Neoptolemus."

Pythagoras of Samos: 1182^{a}11, 1398^{b}14, F90, F176, F177, F178, F182, F183, F193. Philosopher and mathematician (c. 570–c. 495 BC).

Pythagoreans: 94^{b}33, 203^{a}4, 204^{a}33, 213^{b}23, 222^{b}18, 268^{a}11, 284^{b}7, 285^{a}10, ^{b}25, 293^{a}20, ^{b}1, 300^{a}17, 342^{b}30, 345^{a}14, 404^{a}17, 407^{b}22, 439^{a}31, 445^{a}16, 985^{b}23, 986^{b}1, 987^{a}13, 987^{b}11, 23, 31, 989^{b}29, 990^{a}33, 996^{a}6, 1001^{a}10, 1036^{b}18, 1053^{b}12, 1072^{b}31, 1078^{b}21, 1080^{b}16, 31, 1083^{b}8, 1090^{a}20, 31, 1091^{a}13, 1096^{b}5, 1106^{b}30, 1132^{b}22, 1194^{a}29, 1344^{a}10, F21, F53, F54, F59, F90, F176, F179, F180, F181, F186, F188, F189, F190, F191

Pythia: F233, F243. Aristotle's wife.

Pythian Games: 1018^{b}18, 1460^{a}31

Pythian Oracle: 1331^{a}27, *Ath.* 19.5, F14, F15, F16, F226

Pytho: F15. Region including Delphi.

Pytho: 1243^{b}20. Identity uncertain.

Pytho: F222

Pythodorus: *Ath.* 27.2, 29.1–2, 35.1, 41.1, F96

Python: 1311^{b}20. Identity uncertain.

Red Sea: 352^{b}23, 354^{a}2, 606^{a}12

Rhadamanthys: 1132^{b}25, 1413^{b}26. Son of Zeus and Europa; one of the judges of the dead in Hades.

Rhaicelus: *Ath.* 15.2

Rhea: F183

Rhegium: 1274^{b}23, 1316^{a}38. City on the Italian side of the straits of Messina.

Rhinon: *Ath.* 38.3–4. One of the Ten who followed the Thirty Tyrants.

Rhipae, Mountains: 350^{b}7. A doubtful range perhaps parallel to the Hercynian mountains.

Rhodes: 763^{a}31, 1271^{b}37, 1302^{b}23, 32, 1304^{b}27, F64, F142. Largest of the Dodecanese islands.

Rhodope, Mountain: 350^{b}18. Mostly in Bulgaria, partly in Greece.

Rhone: 351^{a}16

Sack of Troy: 1459^{b}6

Salamis: 569^{b}11, 1304^{a}22, 1375^{b}30, 1396^{a}12, 1411^{a}32, 1459^{a}25, *Ath.* 17.2, 22.7, 23.1, 23.5, 27.2, 54.8, 62.2. Island in the Saronic gulf near Athens.

Samos, Samians: 1284^{a}39, 1303^{a}36, 1306^{a}30, 1313^{b}24, 1384^{b}32, 1393^{b}23, 32, 1407^{a}1, *Ath.* 24.2, 62.2. Island in the eastern Aegean.

Sappho: 1367^{a}8, 1398^{b}12, 27, F135. Lyric poet from Lesbos (born c. 612 BC).

Sardanapalus: 1095^{b}22, 1216^{a}16, 1312^{a}1. Luxury-loving Assyrian king (669–626 BC).

Sardinia: 218^{a}25. Island west of the Italian peninsula.

Sardinian Sea: 354^{a}21

Sardis: 94^{b}1. Capital of ancient Lydia.

Sarmatian: 783^{a}14. An Iranian confederation of peoples.

Satyrus: 1148^{a}34

Scamander: 519^{a}18, 19

Sciron: 1406^{a}8. Famous robber.

Sciron, Wind: 363^{b}25

Scombrus: 350^{b}17. Now Mt. Vitosha, part of the Rila massif.

Scylax of Caryanda: 1332^{b}24. Late-6th-cent BC geographer.

Scylla: 1461^{b}32. Monster in the *Odyssey*.

Scylla of Timotheus: 1454^{a}31

Scyllaeum: *Ath*. 22.8

Scylletium and Lametius, Gulfs of: 1329^{b}12. On the toe of Italy.

Scyros: *Ath*. f4, 62.2. The southernmost island of the Sporades.

Scythia, Scythians: 78^{b}30, 350^{b}7, 359^{b}18, 362^{b}22, 576^{a}21, 597^{a}5, 604^{b}22, 605^{a}21, 606^{a}20, ^{b}4, 607^{a}17, 619^{b}13, 631^{a}1, 748^{a}25, 782^{b}33, 783^{a}13, 1112^{a}28, 1150^{b}14, 1324^{b}11, 17, 1367^{b}10. Lands northeast of Europe and the northern coast of the Black Sea.

Sea of Marmara, the: 598^{a}25, ^{b}28

Selli: 352^{b}2

Sesostris (Senusret III): 352^{b}26, 1329^{b}4, 25. Pharaoh of Egypt (c. 2099–2061 BC).

Sestus: 1411^{a}13. Town on the Hellespont where Athens bought its corn.

Seuthes the Thracian: 1312^{a}14. Probably Seuthes II, son of Sparadocus.

Sicania: 359^{b}15

Sicilian Sea: 354^{a}21, 542^{b}16

Sicily: 359^{b}15, 366^{a}26, 520^{b}1, 522^{a}22, 586^{a}3, 606^{a}5, 1259^{a}23, 1271^{b}39, 1274^{a}25, 1316^{a}35, 1411^{a}25, 1448^{a}32, ^{b}7, 1459^{a}23, *Ath*. 29.1, F67, F163

Sicyon, Sicyonians: 1117^{a}27, 1315^{b}13, 1316^{a}30. City just west of Corinth.

Sigeum: 547^{a}5, 549^{b}16, 1375^{b}31. City in the northwest of the Troad region of Anatolia.

Silenus: F75. Mythical follower of Dionysus.

Simonides: 542^{b}7, 982^{b}30, 1091^{a}7, 1100^{b}21, 1121^{a}7, 1363^{a}15, 1367^{b}19, 1391^{a}8, 1405^{b}24, F126. Poet from Iulis on Ceos (c. 556/532–466/442 BC).

Simus the Aleuad: 1306^{a}30. Probably the betrayer of Thessaly to Philip of Macedon.

Siphae: 504^{b}32, 696^{a}5, 708^{a}5. Town on the Corinthian Gulf.

Sipylus: 368^{b}31. Mountain in Lydia.

Sirens: 1230^{b}36

Siritis: 1329^{b}21

Sirras: 1311^{b}12. Possibly the son of Arrabaeus.

Sisyphus: 1412^{a}5, 1456^{a}22, F222. King and founder of Corinth.

Smerdes: 1311^{b}29. Killer of Penthilus; otherwise of uncertain identity.

Smindyrides the Sybarite: 1216^{a}17

Socrates: 103^{a}30, 160^{b}27, 166^{b}34, 183^{b}7, 642^{a}28, 644^{a}25, 767^{b}25, 768^{a}2, 29, 32, ^{b}14, 987^{b}1, 2, 1078^{b}17, 28, 30, 1086^{b}3, 1116^{b}4, 1127^{b}25, 1144^{b}18, 28, 1145^{b}23, 25, 1147^{b}15, 1182^{a}15, 1183^{a}8, 1187^{a}7, 1190^{b}28, 1198^{a}10, 1200^{b}25, 1216^{b}2, 1229^{a}16, 1230^{a}8, 1235^{a}38, 1246^{b}36, 1247^{b}16, 1260^{a}22, 1261^{a}6, 12, 16, ^{b}19, 21, 1262^{b}6, 9, 1263^{b}30, 1264^{a}12, 29, ^{b}7, 24, 29, 37, 1265^{a}11, 1291^{a}12, 1316^{a}2, ^{b}27, 1342^{a}33, ^{b}23, 1357^{b}12, 1367^{b}8, 1390^{b}31, 1393^{b}4, 1398^{a}24, ^{b}31, 1415^{b}30, 1419^{a}8, F13, F14, F126, F159, F174, F226. Philosopher, chief interlocutor in Plato's dialogues (470–399 BC).

Socrates of Theodectes: 1399^{a}8

Socrates the Younger: 1036^{b}25. In later life a member of Plato's Academy.

Solon: 1100^{a}11, 15, 1179^{a}9, 1219^{b}7, 1256^{b}32, 1266^{b}17, 1273^{b}34, 35, 41, 1274^{a}11, 15, 1281^{b}32, 1296^{a}19, 1375^{b}32, 34, 1398^{b}15, *Ath.* 2.2, 3.5, 5–12, 13.1, 14.2–3, 17.1, 22.1, 28.2, 29.3, 35.2, 41.2, F219. Athenian statesman, poet, and architect of the Athenian constitution (c. 640–560 BC).

Sons of Phineus: 1455^{a}10

Sophocles: 1015^{a}30, 1146^{a}19, 1151^{b}18, 1373^{b}9, 1375^{a}33, 1400^{b}17, 1415^{a}20, 1417^{a}28, 1448^{a}26, 1449^{a}19, 1453^{b}31, 1454^{b}8, 1455^{a}18, 1456^{a}27, 1460^{b}33, 1462^{b}3. Tragic poet (497/6–406/5 BC).

Sophocles: 1419^{a}26. Preliminary councilor.

Sophocles: 1374^{b}36, 1416^{a}15. Identity uncertain.

Sophron of Syracuse: 1447^{b}10. Writer of mimes (fl. 430 BC).

Sosistratus: 1462^{a}7. Otherwise unknown.

Sotion of Alexandria: F65. Doxographer (fl. 2nd cent BC).

Sparta, Spartans: 152^{a}14, 176^{b}5, 1102^{a}11, 1112^{a}29, 1117^{a}27, 1124^{b}16, 1127^{b}28, 1145^{a}28, 1167^{a}31, 1180^{a}25, 1245^{b}33, 1248^{b}39, 1263^{a}35, ^{b}41, 1264^{a}10, 1265^{b}32, 35, 1269^{a}29, 38, ^{b}3, 31, 36, 40, 1271^{a}29, ^{b}17, 23, 28, 41, 1272^{a}2, 13, 14, 27, 36, ^{b}26, 28, 33, 1273^{a}2, 20, ^{b}25, 35, 1275^{b}9, 1279^{b}9, 1285^{a}3, ^{b}35, 37, 1288^{b}41, 1293^{b}16, 1294^{b}19, 1301^{b}19, 1303^{a}7, 10, 1304^{a}26, ^{b}14, 1306^{a}19, ^{b}29, 38, 1307^{a}4, 36, ^{b}22, 23, 1310^{b}39, 1312^{b}7, 1313^{a}25, 1316^{a}18, 21, 34, ^{b}8, 1324^{b}8, 1333^{b}12, 19, 22, 34, 1334^{a}40, 1337^{a}31, 1338^{b}12, 24, 1339^{b}2, 1341^{a}33, 1361^{a}11, 1367^{a}29, ^{b}10, 1398^{b}13, 1411^{a}4, 1415^{b}32, 1419^{a}31, *Ath.* 19, 23.2, 23.4, 29.1, 32.3, 34.1, 37.2–38.4, 40.3, F17, F90, F215

Spartan Women: 1459^{b}6

Spartiates: 1270^{a}37, ^{b}2, 1271^{b}11, 13, 1306^{b}35, *Ath.* 19.4. Adult male citizens of Sparta.

Speusippus: 1028^{b}21, 1072^{b}31, 1096^{b}7, 1153^{b}5, F58, F133. Platonist philosopher (408–339/8 BC).

Speusippus: 1411^{a}21. Otherwise unknown.

Stagira: F228, F230, F239, F243. Aristotle's birthplace.

Stentor: 1326^{b}7. Homeric hero gifted with a very powerful voice.

Sthenelus: 1458^{a}21. 5th-cent BC tragic poet, whose style was mocked by Aristophanes.

Stilbon: 1398^{b}3. Theban citizen active in politics.

Stoics: F44, F152, F157

Strabax: 1399^{b}2. Mercenary leader.

Stratonicus: 1231^{a}12. Famous Athenian lute player and wit (c. 410–360 BC).

Strymon River: 350^{b}17, 592^{a}7, 597^{a}10. In Bulgaria and Greece.

Styx: 983^{b}32. Eldest of the daughters of Ocean and Tethys.

Sybaris, Sybarites: 1216^{a}17, 1303^{a}29, 31. City in the instep of the Italian peninsula renowned for its luxury.

Syennesis of Cyprus: 511^{b}23, 512^{b}12

Syme: 1414^{a}2. Island in the Dodecanese chain.

Syracusans, Syracuse: 559^{b}2, 1255^{b}24, 1259^{a}30, 1286^{b}40, 1302^{b}32, 1303^{a}38, ^{b}20, 1304^{a}27, 1306^{a}1, 1310^{b}30, 1312^{b}8, 1313^{b}13, 26, 1315^{b}35, 1316^{a}33, 1384^{b}16, F63. City in Sicily.

Syria: 491^{a}2, 577^{b}23, 579^{b}9, 580^{b}1, 606^{a}13, F63

Syrian Grass: 627^{b}17

Tanais River: 350^{a}25, 353^{a}16. Now the Don.

Tarentum, Tarentines: 631^{a}10, 1291^{b}23, 1303^{a}3, 1306^{b}31, 1320^{b}9, F218. Now Taranto.

Tartarus: 94^{b}34, 356^{a}1. Hades and one of its rivers.

Tartessus River: 350^{b}2. Now the Guadalquivir.

Tegea: 1365^{a}27. City in Arcadia.

Telamon: 1416^{a}3

Teleboa, Teleboae: F210. Mythical prince and his purported descendants.

Telecles of Miletus: 1298^{a}13. Otherwise unknown.

Telegonus: 1453^{b}33. Son of Odysseus.

Telemachus: 1461^{b}5. Son of Odysseus.

Telephus: 1453^{a}21. Telephus was a son of Heracles.

Telephus of Euripides: 1405^{a}28

Telesinus: *Ath*. 22.5

Ten, the: *Ath*. 38.2

Tenedos, Tenedians: 1291^{b}25, 1375^{b}31, 1401^{b}18. Island in the northeastern Aegean.

Teos: 1403^{b}27. Ionian city on the coast of Asia Minor.

Tereus of Sophocles: 1454^{b}36

Tethys: 983^{b}30. Daughter of Earth and Heaven.

Teucer of Sophocles(?): 1398^{a}4, 1416^{b}1. Teucer was son of King Telemon of Salamis and Hesione sister of Priam.

Teumessos: 1408^{a}3. Village of Boeotia in the plain of Thebes.

Thales of Miletus: 294^{a}29, 405^{a}19, 411^{a}8, 983^{b}20, 984^{a}2, 1141^{b}4, 1259^{a}6, 18, 31, F15, F16, F17. Presocratic philosopher (620s–540s BC).

Thales (Thaletas): 1274^{a}28, 29. 7th-cent BC poet from Crete who worked in Sparta.

Thargelia: 1023^{b}11, *Ath*. 56.3–5. Feast of Apollo, held in late May.

Thasos: 549^{b}16, 1448^{a}12, 1461^{a}22. Island in the northern Aegean.

Theagenes: 1305^{a}24, 1357^{b}33. Tyrant of Megara (latter half of the 7th cent BC).

Thebes: 69^{a}1, 202^{b}13, 231^{b}29, 351^{b}35, 500^{a}4, 1093^{a}16, 1269^{b}37, 1274^{a}32, 35, ^{b}2, 1278^{a}25, 1302^{b}29, 1306^{a}38, ^{b}1, 1321^{a}28, 1397^{b}9, 31, 1398^{b}2, 18, *Ath*. 15.2, F222. City in Boeotia in central Greece.

Themiscyra: 554^{b}9. City in northern Anatolia.

Themison of Cyprus: F81. Addressee of Aristotle's *Protrepticus*.

Themistocles: 569^{b}12, 1233^{b}12, 1376^{a}1, *Ath*. 22.7, 23.3, 25.3–4, 28.2. Athenian politician and general (c. 529–459 BC).

Theodamus: 1406^{b}30. Otherwise unknown.

Theodecteа: 1410^{b}2. Perhaps a rhetorical manual by Theodectes.

Theodectes: 1150^{b}9, 1255^{a}36, 1397^{b}3, 1398^{b}5, 1399^{a}8, ^{b}1, 28, 1400^{a}27, 1401^{a}35. 4th-cent BC tragic poet.

Theodectes: F158, F159, F160, F161. Theorist of rhetoric and student of Aristotle.

Theodorus: 1306^{b}28, 1404^{b}22, 1412^{a}33(?). 4th-cent BC tragic actor.
